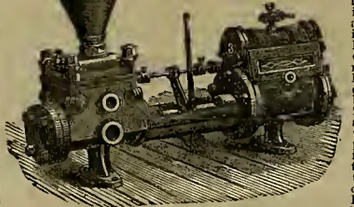
MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it is *at present six feet under water*, yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States new for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cams, nor complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the exhibition of the Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them: we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or shew its advantages to parties calling on them.



It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞Send for circular and prices.

The largest stock in the country at the Machinery Warehouse of

TREADWELL & CO.,

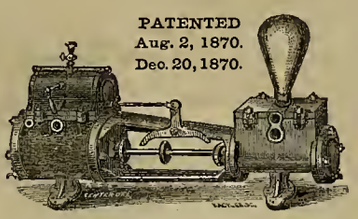
☞ Machinery Depot for Miners, Millmen, and Engineers' Supplies. Iron and Wood Machinery; Portable Engines; Mills; Machinists' and Mechanics', Miners' and Farmers' Tools; Sturtevant's Blowers, Turbine Waterwheels, Etc., Etc.
6v24-eowhp

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal, (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
11v3-awbp CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

THE SELDEN PUMP.



Combines Simplicity and Durability to a Remarkable Degree.

Its parts are easy of access, and it is adapted to all purposes for which Pumps are used—especially Mining.

Full description in *Scientific Press* of August, 1871.

Catalogues sent on application.

IMPORTERS OF AND DEALERS IN
ASSAYERS' MATERIALS,
Chemical Apparatus and Chemicals,
Druggists' Glassware and Sundries,
PHOTOGRAPHIC GOODS, ETC.,
512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of
ASSAYERS' MATERIALS
—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

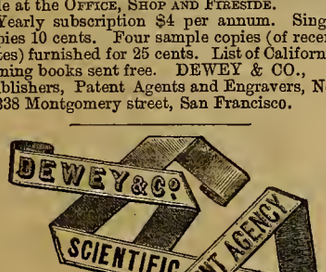
Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.



The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

IS THE LEADING COMMERCIAL SCHOOL OF THE Pacific. It educates thoroughly for business. Its course of instruction is valuable to persons of both sexes and of any age. Academic Department for those not prepared for business course. Open day and evening throughout the year. Students can commence at any time. Full particulars may be had at the College Office, 24 Post street, or by sending for HEALD'S COLLEGE JOURNAL.

Address E. P. HEALD,
President Business College, San Francisco.

From San Jose Patentees.

SAN JOSE, March 15, 1872.—Messrs. DEWEY & Co.—Gentlemen:—Accept our thanks for the prompt and able manner in which you have obtained our letters patent on Animal Trap. Believing you to be gentlemen that can be relied upon as Patent Solicitors, we remain, yours respectfully, COOMBE & PHELPS.

IMPORTANT MINING BOOK.

Mines, Mills, and Furnaces of the Pacific States and Territories; An Account of the Condition, Resources, and Methods of the Mining and Metallurgical Industry in those Regions, Chiefly Relating to the Precious Metals. By Rossiter W. Raymond, Ph. D., Vice-President Am. Inst. of Mining Engineers; Editor "Engineering and Mining Journal." Author of "Mines of the West," "American Mines and Mining," etc. J. B. Ford & Co., 1 vol. 8vo. 458 pp. Ex-Cloth. Sold by DEWEY & Co., publishers Scientific Press, San Francisco, at publishers' rates, $3.50. This volume will scarcely need to be recommended to those who are acquainted with the "Mines of the West," "American Mines and Mining," and other professional publications of its author. The present work is in no sense a repetition of Mr. Raymond's former ones. It contains a full and comprehensive account of the condition of the gold and silver mining industry of the United States, with practical recommendations of great importance to those engaged in it. The chapter on the treatment of auriferous ores in Colorado is the best account of the stamp-mill process ever published in this country; and the general discussion of smelting processes for silver ores supplies an instant want. The series of volumes, of which this forms the third, which have proceeded from the rapid but careful pen of Commissioner Raymond, are recognized in this country and in Europe as professionally authoritative and popularly interesting to a remarkable degree. To be technically accurate, but not technically abstruse, is their salient and acknowledged merit.

HILL'S PATENT EUREKA GANG PLOW,

The undersigned, Manufacturers of "HILL'S PATENT EUREKA GANG PLOWS," take this method of calling the attention of Agriculturists throughout the Pacific States and Territories to the merits of the above named Plows, and offer the following reasons why they are entitled to preference over any other Plow in use.

They are made of the best material, and every Plow warranted.

They are of light draught, easily adapted to any depth, and are very easily handled.

They will plow any kind of soil, and leave the ground in perfect order.

FIRST PREMIUMS!

These Plows took the First Premium at the State Fair in Sacramento, in 1870; at the Northern District Fair in Marysville, 1870 and 1871; and at the Upper Sacramento Valley Fair, Chico, 1870 and 1871. At the Mechanics' Fair, held in San Francisco in 1871, a Silver Medal was awarded these Plows; and the State Agricultural Society, at the last Fair, offered a premium of $40 for the best Gang Plow. The committee was composed of practical farmers from the agricultural counties, who, after a fair test and thorough competition with the leading plows of the State, awarded the premium to the Eureka Gang Plow. From this it will be seen that these celebrated plows still maintain their reputation over all competitors. Patented Sept. 7, 1869.

Champion Deep-Tilling Stubble Plow,

which took the First Premium over all competitors at the State Fair, 1871. It turns a furrow 14 inches deep and 24 inches wide.

This Gang Plow combines durability with cheapness, being made entirely of iron by experienced workmen, of the best material. Over three hundred are now in use, and all have given entire satisfaction.

Manufactured and for sale at the corner of Third street and Virgin Alley, Marysville, by

HILL & KNAUGH,

And also by most leading Agricultural Dealers in the State. All others are invited to apply at once for Circulars, prices, etc. 16v23-tf

VOLUME XXIV. Number 17.

Improvement on Railroads.

We present herewith the illustration of an improvent in the construction of railroads, invented and patented by John L. Boone, of this city, through the SCIENTIFIC PRESS Patent Agency. The invention consists, first, in an improved material for manufacturing railroad ties, and secondly, in an improvement in the construction of the tis itself, by which a greatly improved road-bed is produced.

The first part consists in forming railroad ties of any animal or vegetable fibre, cemented together with asphaltum, and subjected to the necessary pressure in monlds, to form, as it were, an artificial wooden block, of the proper size and shape. This block, it is claimed, will be, to a certain extent, elastic, at least as much so as wood, while being composed of fibre locked up in asphaltum, it will not decay or deteriorate with age like wood. It is also claimed that spikes driven into the block, will be retained with much more tenacity than in wood; thus at once giving two invaluable requisites for a tis. The materials of which the block is composed can be cheaply and readily obtained in all parts of the world, and the tie is easily manufactured in quantity, which is another indispensable requisite for a manufacture so generally required.

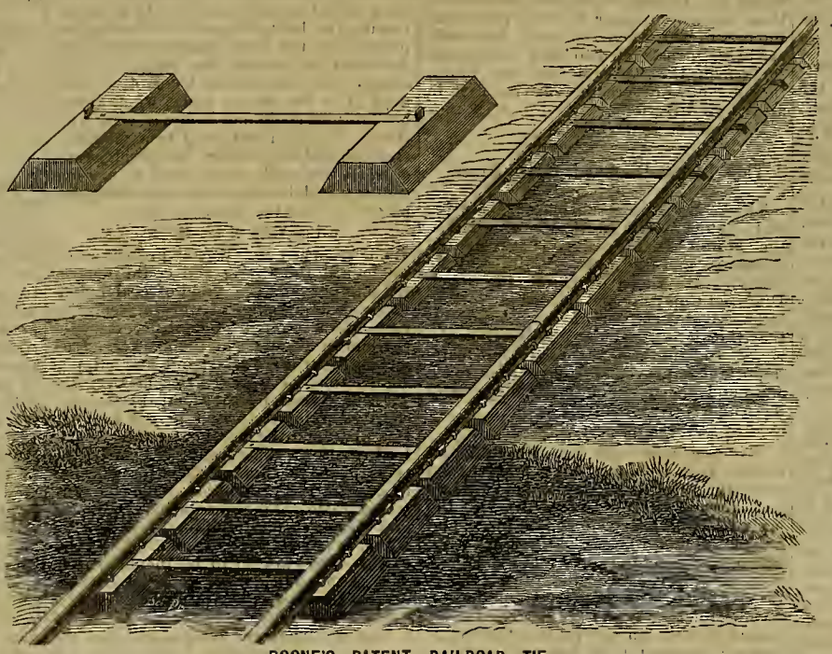
The construction of the tis is plainly shown in the engraving. Two short blocks of the material, say two feet long, by ten inches square, are united together by an iron rod, the ends of which lie in a recess in the block, so as to pass beneath the rail. The ends of these rods are then turned up so as to hook over the outside flange of the rail. The blocks are parallel with each other, so as to form a continuous foundation or bed for the rail. In constructing the track, the ties or blocks are placed closely together, so as to form two side stringers, upon which the rails are spiked, so as to bind the blocks together longitudinally, while the transverse tie rods prevents them from being displaced sideways. By placing the blocks close together so as to form a continuous foundation for the rail, the inventor claims that he avoids the springing of the rails between the ordinary transverse ties, as the trains pass over it. Our readers will recollect the up and down motion of a train of cars, when moving upon an ordinary track, and how it loses this movement when it is running over a bridge, or other continuous foundation. This movement is occasioned by the yielding of the rails beneath the wheels of the cars, as they pass from tie to tie, and is necessarily destructive, to both the track, and rolling stock of the road, besides being unpleasant to the passengers. By constructing the foundation in a continuous line, this is avoided, and a smooth easy movement given to the train. In cold countries, the rails are frequently broken by a passing train, after a cold or frosty spell of weather, and much damage frequently occurs thereby. This is also avoided by this construction.

The fibre being compressed together in a heterogeneous mass, the block will have no grain like wood, and will not, therefore, split; rendering it capable of holding the spikes with extraordinary tenacity, thus ensuring the permanency of the fastenings.

There are already constructed in the United States over 60,000 miles of railroad, and its extent is being increased at the rate of several thousand miles yearly. In every mile of this road the number of ties required is about 2,640, making an aggregate of 158,400,000 ties required on the road already constructed. Supposing these ties to be renewed every four years, it will require 39,600,000 ties per year. We build annually 7,000 miles of new road, requiring 18,480,000 ties, which, added to the annual requirement above mentioned, gives 58,080,000 ties to be furnished every year. Now, if we calculate the average cost of each tie at forty cents, we have a total of $23,232,000 as the annual cost of ties, in the United States alone. This is no fancy picture, but actual facts based upon correct calculation. It is certainly high time that some substitute for wooden ties be introduced, or we shall shortly find ourselves without sufficient timber to keep up our long lines of railroad. Even now in thickly settled portions of our country there is beginning to be a scarcity of timber suitable for railroad ties, and the ties begin to command a high price; *yet we have but just began to build railroads.* Before many years every town and hamlet in the country will have its branch lines, and our land will be a net work of iron bands. Now is the time to begin to introduce some more proper and inexhaustible material for the ties, in order that we may save our timber without further depletion. It is merely a question of time, as sooner or later our railroad engineers will have to look about them for material with which to construct the foundations of their roads. Iron ties are being introduced into India, and we hear of various experiments in that direction elsewhere; but iron, like wood, is not inexhaustible, and its high price and want of the proper elasticity is against it.

The tie above described can be manufactured very cheaply, costing but little, if any more, than wood. The materials of which it is manufactured are practically inexhaustible. Fibre suitable for this purpose grows everywhere, on the prairie, in the swamp, upon all soils and in all climates. It can be obtained for the simple cost of collecting it. Asphaltum is found in immense quantities in the United States, Europe and other parts of the world. But a small proportion of asphaltum will be required in the manufacture of the blocks, its only use being for cohesive and preservative purposes. The blocks can be readily transported to the place where they are required for use without occupying unnecessary space.

This invention has been assigned by the inventor to himself and Rudolph Herman, of this city, and application has been made for foreign patents. These parties intend to use every exertion to have their system of tieing railroads, practically tested in this State, and thus introduce a new enterprise and manufacture upon our coast. We wish them success.



BOONE'S PATENT RAILROAD TIE.

San Francisco Microscopical Society.

The San Francisco Microscopical Society has recently been re-organized on a permanent basis with excellent prospects. They are at present using one of J. Becks (London) binocular first-class microscopes, the property of a member, but will shortly send for one for the society with all the necessary appurtenances. An interesting meeting was held last week at the society's rooms. A number of donations were received among them some slides from Walmsley of Philapelphia, comprising a specimen of Wolffia Columbiana, the smallest of true flowering plants; seed of Japanese Tree (Pantoronia Imperialis); Leaf of Mnium Cuspidatum; Arsenions acid; the foot of a tree toad. A specimen of soil from Owen's River Valley was presented by Mr. Hanks.

The society is limited to 20 active members but associate members are also admitted who come as guests. These are also corresponding and honorary members. The meetings are held once in two weeks. The officers of the society are as follows: H. G. Hanks, President; Dr. A. B. Stout, Vice-President; Chas. M. Kinns, Secretary; Henry C. Hyde, Corresponding Secretary; and D. P. Belknap, Treasurer. We wish the society all success in the interesting field which is before them.

In Nevada county there are 1,240 miles of ditch used for mining purposes, the combined cost of which was $3,720,000, or $3,000 a mile.

Sargent's Mineral Land Bill.

In our issue of March 2d we made favorable reference to this bill, as one well calculated to enhance the interests of the mining community; but we regret to see that a substitute has been introduced into the Senate, which entirely changes some of the important features of the House bill, and in such a manner as to render the bill decidedly objectionable. Thus, Section 2 provides that a mining claim "located by *one* or more persons may equal, but shall not exceed, 1,500 feet in length along the vein or lode; but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located,"

The effect of such an enactment would be to encourage monopoly and discourage prospecting. The original mining act fixed 200 feet as the limit of a single claim. Sargent's bill allowed 200 feet more for discovery; but the Senate bill increases the amount to 1,500 feet for a single claim, which would permit a very few men to acquire an entire lode.

Then Section 4 gives to all parties running a tunnel "the right of possession of all veins or lodes within 3,000 feet from the mouth of such tunnel, on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface;" and declares invalid all locations on the same line previously made by others after commencement of the tunnel. This is applying the privileges of the Sutro Tunnel Act—an exceptional work altogether—to every tunnel that may be run in the mines.

There are several other objectional features in the Senate bill, and we fail to find in it any modification which can be considered an improvement on the House bill. The mining press should speak out decidedly on this bill, and, if possible, bring such influence to bear as will at least modify its objectionable features.

No important branch of industry has been as studiously reflected in legislation as mining; but, when the laws are to be changed, such changes should only be made after mature deliberation and consultation with practical men who understand the technicalities and necessities of mining.

LAKE SUPERIOR GOLD DISCOVERIES.—The region of Lake Superior after getting up an immense silver excitement now goes in for gold. The reported gold fields lie from 70 to 100 miles back from the head of Thunder Bay, in a desolate rocky region, anything but a favorable location to live in. The gold is associated with sulphurets of iron. Reports say that one party of 12 men took out 10½ tons of ore this winter that "assays" from $5,000 to $7,000 per ton. The Saginaw *Enterprise*, in speaking of this wonderful region, also states that the latest discovery is an abundance of tin ore, richer than the Cornish mines, yielding from 40 to 60 per cent. of metal. It also states that the great Silver Islet mine is as rich as ever, and another new vein has been found as rich as the Silver Islet. We prefer to take all these statements "with a grain of salt," for it looks like somebody wanted to create an excitement and sell out; at least that would be a Californian's view of the matter.

CORRESPONDENCE.

From the Smoky City.

[Written for the PRESS.]

EDITORS PRESS:—If there is one thing more than another which will hring conviction to the mind of a Californian that the Pacific slope has tbe finest and beet climate under the eun, so far, at least, as we Americane are concerned, it is for him to take a trip overland in mid-winter. And if he does not soon find evidence more convincing than "proof from Holy Writ," then I am mistaken. There are a class of chronic grnmhlers in California who are continually finding fault with this, that and the other, but I helieve they could be easily cured hy causing them to pess a winter away from the Pacific slope in eome of the Eastern or Western States, and methinks I wonld hear them eey: "California, with all thy faults I love thee elill."

Since my arrival, numerous persons have made inquiries regarding California, her mines, productive soil and wonderful climate—where vegetahlee can be reised all the year round—which last, I have no douht, is received with many grains of allôwance by those who have passed a greater portion of their lives in a Northern clime, and who thiuk there are none hetter.

Pittsburgh.

Who hae not heard of the Smoky City with her wonderful manufactories, rich depoe its of bituminous coal, or as they are termed here, Black Diamonds, her glaes manufactories, which fnrnieh most of the glase used in the United States; her rolling mills, whose products can he found in almost any portiou of this continent. Her foundries of brass and iron are known far and near; for bere were made, during the Rehsllion, the famous Rodmen guns, which performed such good service in the cause of the Union. Here, also, are locacated some extensive plow factories which supply the Weetern and Southern States; and on many a Western farm, and Southern plantation can he eeen specimens of Pittshurgh manufacture. In fact, there is scarcely any article of iron or glass which has not a representative factory here.

Pittshurgh, geographically considered, ie well located, at the confluence of the Monongahela and Alleghany rivere, and in the course of time must attain to a high position as a commercial city, owing to the advantages which she possoses as a distrihuting point. But the great eecret of her prosperity lies in the enormous coal fields adjscent to the city; and some authorities tell us that the city overlays a bed of cosl, fourteen fect thick, but which will not be worked for many years, as the coal heds in the hills can be worked with greater profit. Each new railroad which is put in operation brings to light new discoverics of coal. The Pittsburgh, Virginia and Charleston Railroad, whiob has just hesn graded, is reported to have discovered magnificent veins of coal of a better quality than any now in use in this city.

Of late yeare, conaiderable attention has been paid to the cultivation of the grape in this region, but it does not meet with the success that attends the business on the Pacifie slope; in fact, I do not tbink the climate adapted to vinicultural pursuits; the seaeon is too ehort, and as soon as the frost appears the grapee are withered. Concord and Catawba varieties prove to be the best reised here.

Black Diamonds,

In Pittshurgh parlance, means coal, and the trade in the above mentioned article with the towns and cities on the Ohio and Mississippi rivers contribute to the prosperity of all concerned, from the dusky digger in the pit to tbe Black Diamond merchant. Eaob riee in the river is hailed with delight, not only by those who are engaged in the trade, but hy all the inbabitants of tbe towns and cities on the lower rivere, from Pittsburgh to New Orleane. Yeaterday was a buay day with them. As I stood on the bank of the Monongahela river I countod twelve coal tugs in eight with their tows, and the daily papers of this morning's ieeue inform us that yesterday aud tbis morning's ehipmente of coal wonld amonnt to 6,700,000 huehels, end 300,000 hnshels of coke; for he it known to the people of California that here, coal and ooke is sold hy the bushel, and not hy the ton, as on the Pacific Coast.

A New Enterprise.

Last summer, an experiment was made in smelting some of the rich silver oree of the Crœsue mine, in Utab, by some enterprising gentlemen of this city, and the result has exceeded their most sauguine expectations. So well were they pleased with the reeult that it is now their intention to erect an extensive smelting works, for the purpose of reducing the rebellious oree of that regiou. If this enterprise ie euccessful, no doubt we ehall soon eee Pittshurgh become the Swansea of the United States—as they have every facility here for the prosecution of the husiness.

Consolidation.

This city has lately consolidated with the towns contiguous, a subject that has heen agitated and discussed for many years. It finally has been accomplished, and now the Smoky City boasts of 120,000 inhahitants, placing her the eleventh in the renk of cities, according to population.

Prospects.

At no time in the history of Pittshurgh were prospects more flattering than at present. Work is plenty, and men are daily called for through the advertising columns of the papers. The price of iron has advanced, owing to an advance in Europe.

The price of soda has advauced from 3 cents per pound to 7 cents per pound, and as a consequence, the glass manufacturree have determiued to advance tbe price of glaes ten per cent. Some of the manufactories are making extensive additions to their worke, in order to keep pace with the orders whicb come to hand. Railroads are being constructed to nsw coal fields, to furnish the reqnisite fuel, and buildings in course of erectien can be seen in almost all directions. W. E. D.

Pittshurgh, April 3, 1872.

The Black Diamond Coal Mines.

The heet yielding and most extensive and systematically worked coal mines in the Monnt Diahlo range between the mountaiu and the San Joaquin, eays the *Bulletin*, are tbose owned by the Black Diamond Company and located at Nortonville. A description of these mines as they then appsared, was puhlished in the *Bulletin* ahout two years ago, hut many important improvements have heen made since and the yield of the mines greatly increased.

The Differcnt Veins.

The coal veins are found at different dcpths in a eeries of high and rugged sand-stone, cnt hy deep and eharp ravines and epareely timhered to the eouth of the mines. The upper vein at this place, and one of the first worked, is the Clark vein. The opening of tbe tnnnel is at a considerable elevation above the town and is reached hy a large and steep incline, on which the coal cars are rnn. The tunnel extends almost on a level into tbe mountain a distance of 4,580 feet with outlying drifts or chambers from whicb the coal is obtained. Work in tbis mine is not carried on as extensively now ae formerly; the other veins taking the lead. Next below the Clark vein is the Lower Black Diamond, with a gangway or tnnnel along the vein, 5,430 feet in length. The next in order is the Monnt Hope vein, with gangways 3,810 feet in length; and the last opened mine is still helow and called tbe Lower Mount Hope, gangwaye 1,000 feet long. The Mount Hope proper is reached by a steep incline, and about 300 feet deep, and from that level another runs to the Lower Mount Hope, a distance of abont 400 feet. The veins in these mines average in thickness from three to four feet, and furnish an excellent quality of coal. The cars are moved on the first incline hy a powerful engine on the eurface driving immense drums, on which the steel wire rope or cable is wound. A eimilar engine and ponderons hoisting drnms are located deep uuder gronnd at the foot of tbe firet incline, and furnisbed with steam through well protected pipes from the hoilsrs outside. Last winter the miners in tbe Lower Monnt Hope struck a large etream of water which filled the gangway and drove them out. Two of Stoddart's steam force pumps in the Upper Mount Hope were set at work, and the mine was eoon cleared of water. Two more of these pumps were then placed in the Lower Mount Hope, and one of them is kept running day and night; the other one being beld iu reserve. Tbe stream of water continnes to flow, but the pumps send it all to the eurface. Two large pumps are on the ground to he placed in the Upper Mount Hope for the better draining of the works sbould the flow of water ever increase.

Utilizing Refuse Coal.

The six large hoilers at the worke were at firet furnished with iron smoke-stacks, and it was found impracticable to hnrn ecreeninge and slags from the miues in the furnaces. A spacious and tall hrick chimney was erected, and the strong draft crsated hy it enables the company to utilize materials which would otherwise he piled up at a distance from the works and hurned.

Machine Shop.

Another important improvement end addition ie the machine shop, which has heen in operation but a short time. It contains turuing-lathee, drille, punches, forges, etc.; and the company not only does its own iron work there, but furniehes, repairs, etc., for other companies and individuals iu the vicinity.

The Railroad.

The coal is discharged from bnnkers at the mine into iron box cars. When a train is loaded, hrekemen take their placee, and it rushes down the eteep grade to the Bleck Diamond landing on the river, about eix milee helow. The locomotives are employed only in hauling hack the trains of empty cars, and a emall paesenger car which makes stated trips for miuers, ranchmen and school children. One of the locomotives lately imported from the East, is a ponderous machine, and carries its tender like a huge saddlo on ite hack. The object of this arrangement eecme to be to throw as much weight as possihle over tho locomotive driving wheels, increasing their adhesion to the rails when the eteep ascent is to be made. During the heavy rains the hallasting on portions of the road hecame so soft that it would not eustain the weight of this monster, and the emaller locomotives were ueed till a few weeks since, when it was hrougbt out again and ie now at work with them. The railroad itself ie a model of strength and durahility. The hridges and culverts are well constructed of massive timbsrs, and trackmen are constantly employed to keep the whole in repair.

Tho Yield of the Mines.

Thc company employs at present ahout 350 men in the mines, and could increase the numher and the yield of coal indefinitely, hut the plan of working seems to he to extract no more than ie neceseary for the known demands of the market. Last montb there were taken ont and shipped 10,518 tons of coal. A steam tug, the *Rabboni*, owned hy the company, is constantly employed towiug barges between this place and the landing. Other veseels load there at timee, and several of the river etcamers etop regularly for supplies of coal for their fnrnacee. The company contemplate makiug further improvsments and developments, the exact nature of which is not yet made known. The yield of the mines appear to be inoxhanstihle, and as the demand for their product increasee their capacity must ho enlarged.

BORAX.—The Inyo *Independent* has the annexed on this eubject: Tbere is in the vicinity of Columhns ahout 3,000 acres of laud containing borate of lime and borate of eoda. The dsposit varies in thickness from one inch to fifteen inches, and tbe crude material, ae taken from the marshes, yields ahout 15 per cent. of horacio acid. A firm is manufactnring a superior quality of horax from the horate of soda. Their horax is made by a procose differing entirely from tbat hy which the English borax ie made. It contains an excess of horacic acid and a lese per cent. of soda, hence its superiority over the European article. They own their own lands under State laws, hut wben the Government surveye are extended over tbsm they will, of course, have to purchase of the Government. Large quantities of horax can he made from tbese marshes, as the supply is almost inexhauetihle—tbc horate of eoda forming again within a few weeks aftsr it bas once heen gathered from the snrface of the land. We are indehted to Markley of Bishop Creck, for ssmples of the horax which, so far as we are ahle to judge, is as fine an article as was ever manufactured.

CALIFORNIA WHEAT EXPORTS.—The total export of wheat and flour for the United States, Eaat of tbe Rocky Monntains, reached an aggrogate value of ahont $68,000,000 in 1870. That value will not be mnch increased for the coming year, while California alone will he able to send away about 600,000 tons at a value somewhat exceeding $20,000,000

GIANT AND BLACK POWDER.—It ie well known that eix men have heen engaged at the Eureka mine, for the last montb in running a cross-cnt, and that these men have heen using the Giant powder as a hlasting agent. During the month the eix Giant powder men made 40 feet, the rock throngh which they ran being very hard in some places and not eoft in any spot. In the five months previous an average of 21 feet per month wae made with hlack powder and double drille. The men working Giant powder have not been eick a minnte during the 26 days they have been working in the crose-out. Three of the men who worked with the Giant powder were green hande at under ground mining. We are furnished with the following statement which compares the cost of using the two kinds of powder:

Statement.

In regard to the trial between hlack powder and double hand drill, and Giant powder and single hand drill, in the crosscut of the Eureka mine: Six men with single hand drill and hlack powder in five months drove 105 feet, or 21 feet per month. Six men with single hand drills and Giant powder drove 40 feet in one month at a cost to the Eureka Company, as follows:

DOUBLE HAND DRILL.

Labor	per month	$468 00
Black Powder,	" "	11 50
Candles,	" "	11 70
		$491 20

SINGLE HAND DRILL.

Labor,	per month	$468 00
Giant Powder,	" "	75 00
Caps,	" "	18 75
Candles,	" "	11 70
		$573 45

Cost per foot Giant Powder and single hand drill.....$14 33
Cost per foot Black Powder and double hand drill..... 23 39

or a saving in favor of single hand drill and Giant powder of 38¾ per cent.—*Grass Valley Union.*

A Strong Nation.

The census of 1860 gavo the total property velues of the United States at $16,000,000,000. The censue of 1870 makes a return of nearly $32,000,000,000. Thus the wealth of the nation had about doubled itself in a decade during which the country was convulsed hy a great civil war, involving an expenditure, to hoth sides, of not less than $6,000,000,000, and a vast detruction of life and property. Seven years aftor this terrible struggle, tbe total of national, state, county and mnnicipal dehts is only $3,271,874,768, and the country sustains a total tax of $688,520,435. These figuree give an impressive idea of the financial strength and wonderfully rapid development of the United States, in view of which, the National deht seems a light affair. Tho showing is the more remarkahle when we reflect that this debt has hsen reduced at a rate that would extinguish it in tweuty years, wbile permitting yearly reduction of taxation. All the hlunders of all the politicians cannot repress energies so boundless, though they may preveut their fullest and healthiest action.

SCHOOL LANDS.—The Surveyor General has forwarded to the different Boards of Supervisore of the State a communication calling attention to an Act in relation to school lande, approved April 4, 1870, whicb provides: "The Snpervisors of the eeveral conntiee of this State are hereby reqnired to report to the Surveyor General of the State, within six monthe after the passage of this Act, all school lands within their respective countiee heretofore eold under any law of this State, except those sold under Act of March 20, 1868; and all lands thue returned, whether eold or uneold, and not paid for, sball be subject to tbe provisions of said Aot of March 28, 1868, provided that delinquent purchasers of any euch lands shall have six monthe after the paesage of this Act to make full payment for the lands purcbased, and failing to do eo shall be proceeded against as provided for in said Act of March 28, 1868."

AGRICULTURAL VALUES.—The total value of the agricultural productione of California comprise 45 per cent. of her total indnetrial wbeat products; tbe producta of her mines—gold, silver, copper, quicksilver, coal, etc., reacbes only about 16 per cent; leaving but 40 per cent for all her otber industrial producte. The agricultnral yield of California for the year 1872 will he largely in excess of al other products oombined.

MECHANICAL PROGRESS.

The Physical Properties of Steel.

What is steel? This is a point which has been much discussed, but one upon which no conclusion has been reached, chiefly from the fact that the meaning of the word has never been clearly defined. We have the series—pig-iron, steel and wrought-iron; but the exact limits of steel have never yet been defined. The province of steel is sometimes enlarged, sometimes unreasonably circumscribed. In its properties and in its manufacture it is comprised between the limits of cast and wroagbt-iron—but when it begins or when it ends has never been defined. We condense the following from a work recently published by M. L. Graner, of the Paris School of Mines:—

The elements which enter into the iron in its conversion to steel are quite various, and of such slight proportions, in relation to the mass of iron, that even their exact determinations are difficult. These uncertainties render it extremely difficult, if not impossible, to produce two specimens of steel exactly alike. The same difficulties, indeed render it equally difficult to prescribe the exact limits of the composition of cast and wrought-iron.

The same foreign elements are found in cast-iron, steel and wrought-iron—the difference between the different members of the series is due solely to varying relative proportions, and chiefly to the single element of carbon. In each instance this element is found partly in merely mechanical mixture and partly in intimate combination or rather solution.

The large influence which carbon exerts on iron may be inferred from the fact that when iron is in a certain condition it requires only a few tenths of one per cent. to so modify it as to cause the iron to pass into that which is unqualifiedly steel. Indeed Rivet appears to think that the two are chemically identical—that steel is a mere change in the molecular constitution of iron.

There are certain ores known as "ores of steel," which naturally produce steel at a certain stage of fining, but which by still farther fining pass into iron. Again this same iron gives steel of a superior quality or cementation.

All metals, in fact, undergo remarkable changes through the influence of exceedingly small proportions of various foreign substances. Copper is partly modified by the merest trace of oxygen, sulphur or lead, zinc and tin by only a few tenths of one per cent. of iron; gold, according to Fremy, is rendered as brittle as antimony by one one-hundredths of one per cent. of lead or bismuth.

According to Fremy nitrogen exercises an important influence on iron—that steel is due not to the presence of carbon alone, but to a combination of iron with *nitrocarburets*. Careful analysis, however, shows that there is no fixed relation between the properties of nitrogen and carbon in either steel or iron—and that the proportions of nitrogen are found to vary, while those of carbon are more constant. Hence it has been supposed that the presence of the former is more or less accidental and unimportant.

Analysis shows that crude wrought-iron retains a part of all the elements present at the reduction of the ore in the blast furnace, and when steel is obtained from iron by fining, only those elements are completely eliminated which are readily oxidized, and here only a slight affinity for iron. Among those thus retained in greater or less proportions are carbon, aluminum, sulphur, phosphorus, silicon and copper.

In reality, steel and wrought-iron are compounds almost as complex as the crude pig which comes from the furnace—the proportions only are less. The proportions of carbon in that metal have no absolute value as regards its tempering power or the facility with which it may be drawn out.

All the carbon in white irons and tempered steel is really *combined* or held in solution, while in gray iron and steel not tempered, a portion of the carbon remains deposited *in the form* of graphite.

NEW STUFFING FOR CUSHIONS.—A material which has come quite extensively into use in Germany, as a substitute for hair in the stuffing of saddles, etc., consists of a mixture of flax seed and tallow. The advantage of this substitute consists primarily in the fact that the mobility of the seeds, one upon the other, prevents the packing or settling in any particular place, as often happens in saddles stuffed with hair, thus causing any given pressure to be readily and uniformly distributed over any given surface. The tallow serves the purpose, too, of keeping the leather flexible, and of preventing the absorption of perspiration, protects the article itself, and prevents the back of the animal from becoming galled. Animals with sores or galled spots on the back can be ridden with saddles stuffed with this material without any great inconvenience. The tallow also has the effect of preventing the rotting of the flax seed, and is to be added in sufficient quantity to give the requisite softness to the entire mass. An aromatic odor can be imparted by introducing oil of turpentine or camphor powder, and the durability considerably increased thereby. One part of tallow to from six to ten parts of flax seed may be used, according to the temperature.

Band-saws for Cutting Large Timber.

The substitution of the band saw, for the old style of reciprocating gig-saw, has produced in many kinds of wood working a decided revolution in the greater speed with which the work may be performed. But few would suppose that the same principle could be adopted to advantage in sawing large logs from the forests. This, however, has been done, and sawing machines constructed on this principle, capable of sawing stuff forty-eight feet in length, are for sale by firms located both in Philadelphia and London. We do not know that these have yet been used to an extent warranting the belief that they will prove more useful for ordinary sawmill work, or for sawing timber which two circular saws, one above the other, are found capable of cutting into plank; but for various special purposes, like the shaping of ship timber and many others, this adaptation of the band-saw seems to possess much merit, and will doubtless meet with extended favor, and may possibly admit of modifications in its structure now unthought of.

As concerns the proportions of the machine as made for heavy sawing, we find the diameter of the wheels over which the saw passes stated at six feet. These wheels are of wrought iron, and are tightened against the saw to a tension of from two and one-half to ten tons, the uppermost wheel being vertically adjustable a distance of twenty inches, and having its shaft, four inches in diameter, of steel. The shaft of the lower wheel is of wrought iron and is half an inch greater in diameter, and the journal boxes of both are lined with hard brass. The log carriage is commonly made with especial reference to the variety of work for which the machine is designed, and of course varies according to circumstances. For resawing, feed rolls are fitted to the apparatus. The production of large machines of this kind furnishes a good example of what may be done in extending the utility of an invention merely by the application of mechanical judgment without any exercise of what can be properly called inventive skill.—*Cabinet Maker.*

WROUGHT-IRON TIES.—An English scientific journal makes the following interesting statements: The new railway sleeper which has lately been brought forward in England, is likely, it is thought, to prove of special advantage in some respects, and particularly in tropical countries. The constructors of the various railways in India, for example, experience the greatest difficulty in making and maintaining the permanent way. The dry rot, and those pests of India, the white ant, are terribly destructive. Sleepers sent from England creosoted and "pickled" are not protected from the influence of the sun and vermin, and seldom or never last more than three years. It was necessary, therefore, to find a substitute impervious to the attacks of insects, which might be made perfect and ready to be laid down whenever and wherever required. The new sleeper is made up of a number of webs and plates of rolled iron, rivited together, and pierced with bolt-holes for the chairs. This is estimated to save about two-thirds of the labor of laying, and leaves but little work to be done by native or other labor. The direct cost is found to be not more than one shilling each above that of the best wooden sleeper, and they are calculated to last ten times as long in tropical countries, and three times as long in Europe. Many eminent engineers and railway constructors, who have examined these sleepers, express great confidence in their superior adaption.

THE iron sea forts now in course of construction for the defence of the prominent naval stations of Great Britain, will, with the foundations, cost five million dollars apiece. The iron shell of one of the forts for Spithead, near Portsmouth, has been shipped by rail for that harbor from the works of the Whitworths, in the iron districts. This shell or skeleton weighs twenty-four hundred tons, and is to be fitted up with fifteen inch iron plates twenty-six feet in length. Each fort is to be seven hundred feet in circumference and two hundred and thirty feet high. They are to be armed with two tiers of guns, one tier of twenty-four 600 pounders, and the other of twenty-five 400 pounders. The guns, it is calculated, will pierce twelve inch iron ships at two thousand yards distance.

BROWN TINT FOR IRON AND STEEL.—Dissolve, in four parts of water, two parts of crystallized chloride of iron, two parts of chloride of antimony and one part of gallic acid, and apply the solution with a sponge or cloth to the article, and dry it in the air. Repeat this any number of times, according to the depth of color which it is desired to produce. Wash with water and dry, and finally rub the articles over with boiled linseed oil. The metal thus receives a brown tint and resists moisture. The chloride of antimony should be as little acid as possible.

ARTIFICIAL BUILDING STONE is now made with air chambers extending through the entire walls, rendering them airy in summer and winter, impervious to frost, and comparatively water and fire-proof. The coping grooves together, forming one continuous solid stone, ever protecting the walls from the destroying elements of fire and water. The "Coming Stone" for foundation is stronger than many natural stones, and for building purposes—properly prepared—artificial building stone is as little liable to disintegration as natural stones.

SCIENTIFIC PROGRESS.

Atmospheric Influences on Lunacy.

The Chaplain of the Hayward's Heath Lunatic Asylum, Brighton, Eng., appends to the last annual report of that institution, a very interesting paper on the "Effects of Meteorological Facts of Insanity." A chart shews the rise and fall of lunacy for the last four years in relation to the changes of the atmosphere, the phases of the moon, the amount of ozone in the air, the rainfall, etc.

One of the results of this chart is fatal to the "vulgar error," that gives its very name to lunacy. "There is," says Mr. Crallan, "very little difference to be discovered in patients' fits between the average numbers for those days on which the moon's changes occur, and for the days composing the rest of the months, and what little difference there is in favor of the days on which no such change occurs."

It is very different with the sun. "I find," says Mr. Crallan, "upon examination of 212 accessions of fits, that, with five exceptions, they have been preceded or accompanied by considerable alteration in atmospheric pressure or solar radiation, or both; and here, I believe, lies the clue for which I have been seeking. For it seems to me tolerably clear that when a great fall or a great rise of the barometer, or a great rise or fall of solar radiation occurs—i.e., a decided change from bright to dull weather, or the opposite, or when both the atmospheric pressure and the solar radiation are much disturbed either in the same or contrary directions—an accession of fits invariably occurs. I am led, therefore, to the inference that it is, after all, not the moon which directly affects the epileptic patients; but the change of weather; and that it is the coincidence which not unfrequently occurs, of a change of weather with a change of moon, which has led the popular mind into the notion of the moon affecting both the weather and the epileptics."

So, too, of electricity:—"I find that, without one single exception, that these instances of augmented melancholic relapses have occurred after considerable disturbance of atmospheric pressure and solar radiation, either in the same or opposite directions. There is no doubt left on my mind of the fact that such disturbances are always accompanied by, if not due to, some alteration in the electricity. I find too, that on ten of these occasions I have records of thunder storms or heavy gales, but have no means of judging how far similar conditions might have existed at other times when these unmistakable manifestations of disturbance were too far off to be heard or seen, but not too distant to affect the health or to produce mental irritation or depression.

"I come, then, to the conclusion that, so far as my own observations go, any marked change of atmospheric pressure, solar radiation, or both, either in the same or contrary directions, is almost certain to be followed by increased number of fits among the epileptics, or by a development of mania or melancholia."

Piano Playing.

It may interest musicians as well as scientific gentlemen, to learn that Professor Schmidt, a German, has fully shown that pianists are men in whom certain mental qualities are enormously developed, and that their physical force is something astounding. The Professor heard Herr Rubenstein play at a concert, and took it into his head—of course after he had gone home—to count the notes which Herr Rubenstein had played by heart. The physiologist Haering has asserted that the profession of the pianist taxes the memory more severely than almost any other calling, and Professor Schmidt's counting of the notes gives countenance to the assertion: for by it the fact was shown that in that one performance Herr Rubenstein had used 62,990 notes. The Professor then used certain Austrian coins as a dynometer to test the pressure necessary to strike a key on Herr Rubenstein's piano, and found it to be equivalent to two ounces and a half, and so it was shown that the pianist in playing the 62,990 notes had used a force amounting to nearly 94¼ cwt.

The question arises, however, did he not exert a force far greater than this? for no pianist—especially no German pianist—uses merely force enough to bring a sound from the wires. What Bulwer said of Beethoven's "Storm" roused by the fell touch of a German pianist should be remembered, and would probably go to show that in that one piece alone Herr Rubenstein exerted force enough to move the earth from its orbit, while the ordinary player at concerts in the Bewery, should he utilize for that purpose the force he expends in one evening, might easily lug the world away far out of the reach of Professor Plantamour's comet, which threatens to destroy us all on the twelfth day of August next.—*The Week.*

ORIENTATION OF FRUIT TREES.—In *Les Mondes* we are told why some fruit trees in the open air are weak, contorted, and stunted. Their defects are due to the neglect of the precaution of placing them, when transplanted, as they had stood in the nursery ground. It is the effort of these trees to recover their original orientation which causes the contorted appearance.

The Principle of the Least Action in Nature.

Prof. Haughton, of Trinity College, Dublin, has recently delivered three very remarkable lectures which have attracted no inconsiderable attention, and involve the consideration of a very important principle, not only in mechanics but in nature generally.

Dr. Haughton pointed out that the principle of "least action" has been long known to mathematicians and physicists, but that it applies not only to material and inanimate objects, but likewise to animated nature, both in construction and action generally. The principle of least action, as it is applied to mechanics and astronomy, consists in showing that a certain integral v, ds, must be the minimum, where v is the velocity at each point, and ds the element of its motion, and upon this principle the most accurate calculations can be made.

Not only can astronomical calculations be made upon the principle of least action, but in architecture the construction and very existence of certain forms depends upon rigid adherence to this law; the construction, for example, of a truly "self supporting elliptical equilibrate dome," being an excellent illustration. Not only, however, does this important principle govern the inanimate world, but it is clearly demonstrable that the muscles of animals are arranged, weighed, and built up in accordance with this law, and that the needful automatic actions of organized beings follow the same precept.

Thus the bee is shewn to construct its cell upon this principle of "least action," Nature aiming at the production of a maximum quantity of work, with a minimum amount of material; for, inasmuch as it "costs the bee the trouble to make wax," so the construction of its cell, in a mathematical form which gives the largest possible room for storage of food with the smallest amount of wax, saves the bee trouble in collecting daily food to support muscular strength, by enabling him to build the best cell for the purpose with the smallest quantity of wax, and consequently with the least expenditure of force. Probably no more complete example could have been given of the fact that the bee's instinct accords in its action with the least expenditure of force in the production of the greatest beneficial results.

Carrying out this principle, it is shown how the shape and attachment of various tendons, ligaments, and muscles, the position and structure of different joints in various animals, are so arranged that the principle of "least action" is observed throughout. It would be impossible in a brief notice to give examples of this adaptation of means to an end in the most economic way, so far as the conversation of force is involved; but the illustration wherein it is shown that the arrangements of the spiral fibres in the heart is such that each fibre is made to do the maximum amount of work that its structure and arrangement are capable of, is especially beautiful. Thus we see that in the means employed by nature in briaging about the desired results there is no waste of force or redundancy of material—a consideration which it is especially important for the mechanist to endeavor to follow; and the lectures, above referred to, bearing entirely upon this grand principle of least action in nature, are as well worthy of the consideration of the mechanical engineer as they are of the physiologist and physician.—*Mich. Magazine.*

MOSES, AND MODERN SCIENCE.—J. Elliot, formerly Professor in Queen's College, Liverpool, says:—Geologists are not agreed about the number of hundreds or even of thousands of millions of years which must have elapsed since the earth'a crust took a definite and palpable form; and the Biblical expositors are still less agreed as to what can be made with their days. The exposition given by the late Hugh Miller was at once worthy of modern science, and of the spirit of poetry which invests old legends. He divides the earlier geological periods somewhat differently. He thinks he gets rid of the awkward difficulty of the supposed creation of light before that of the sun, and of the absence of the sun and moon until the fourth day, and that he has established a closer agreement between the record of Moses and the revelationary science than has ever been suggested before; while all the arguments and scarcasms launched against previous interpretations lose their force falling on empty air. He expresscs himself as well aware of the difficulty of the task set before him; but trusts that he has at least set up the framework of a sound structure, which the learning and ingennity of others may ultimately render more perfect in its details. Mr. Elliot has published a small volume in support of the above.

VARIETIES OF COLORS.—New tints of the various colors are constantly being discovered, even the two thousand shades which have been produced by the dyer's art only indicate the effects that may be produced by a continual admixture of one tint with another. Among the forty or more shades of blue, scarlet, crimson and yellow, there are hues which were wholly unknown a few years ago, and for which it has been necessary to coin an arbitrary name, as they resemble nothing previously known. Every little while the popular fancy demands a new variation, and colors must be mixed and blended until something entirely novel is produced. It may be pretty or otherwise—that is regarded as of comparatively little importance, provided it is the *style*.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

I X L—Alpine *Chronicle*, April 13: A few days since a small vein 3 to 4 inches wide, was struck, assaying $292.62 and $1,079.73 per ton.

CALAVERAS COUNTY.

THORN MINE.—San Andreas *Citizen*, April 13: We were shown specimens last Wednesday of a singulsr nature. The ore came from a depth of 250 ft., and partakes of the natnre of crystallized quartz. This rock is worked at the rate of $40 per ton, and is growing richer, as they advance. Thorpe Co. has completed its hoisting works, and have started the mill which had been idle for the past 2 months. This Co. have a shaft 75 ft. in depth, and a level running south 60 ft. A level has also heen started to run northerly to obtain rock to keep the mill running night and day.

MILLS GRAVEL LEDGE.—The gravel has to he crushed hy an arastra before it can he worked, and yet Mr. Lloyd took up a pan of it and washed ont $2.25 The parties owning this claim are erecting a 5-etamp mill, which will he used to orush the quartz of some of the claims here. The Co. has just realized 66 ozs. on a 2-week's run.

SCHFFERD'S CLAIM.—This claim is down about 16 ft. and has struck a very fine lead. We were ehown specimens which show free gold, and will pay over $40 per ton. Some of the rock was prospected—merely pounded up with a hammer—and the result ehowed 25 cents, free gold. The piece pounded did not weigh a pound.

HUDSON.—The shaft is down 116 ft. and is going down till it reaohes 200 ft. At that depth tunnels will be started and a mill put up. The rock has improved all the way down, and the vein is 9 ft wide, abounding in sulphnrets and free gold.

GWIN.—The maiu shaft has heen retimhered, from top to hottom, and the water completely subjugated.

STICKLES.—It is the intention of the Co. to add 10 stamps to their mill—making 20 etamps in all. The ore taken from this lead is working as high as $15 per ton, and the Co. are running 20 men day and night.

BOVEE.—This mine is at or near Angels, Negotiations are in progress for its purchase by a German Co., who will at once ereot a new mill and put a force of miners to work.

WASHINGTON.—Ore is taken from the depth of 150 ft., which is working at the rate of $14 per ton.

ANGELS QUARTZ CO.—This Co., known as the Big Mine, are working from tho 500-ft. level, and taking out ore which pays $15 to the ton. The Co. are working 60 men night and day.

UTICA.—This Co. are working ore from the depth of 50 ft. The ore is worked hy an arastra and pays $40 per ton.

WEST POINT.—Cor. same: In the Zacatera they are ruehing out the ore. They have out already a great many tons assaying $250 per ton, the lead widening as they go down.

The Bartolo Co. are getting out rock and are working day and night. The ore is very rich.

The Woodland is a perfect success. The lead is about 2 ft. wide and the ore is very rich. A considerahle quantity of rock is waiting for teams to haul it.

SLUICE ROBBERY.—Calaveras *Chronicle*, April 20: On Friday night of last week the sluices in Moser & Co.'s claim, Tunnel Ridge were partially "cleaned up."

WHISKY SLIDE.—The mill on the Whisky Slide mine—a 10 stamp hattery—is kept running day and night. Several hundred tons of rock will he crushed before cleaning up.

WORK COMMENCED.—The Calaveras Hydraulic Co. Central Hill, have oommenced washing. One hundred and sixty inohes of water are used.

GOOD ROCK.—Four and three-fourth tons of quartz, from the 100-ft. level in the Lamphear, Spring Gulch, yielded $12 per ton.

PETTICOAT.—We have heen shown some very rich specimens of quartz from the 300-ft. level, about 40 ft. from the main ehaft. The quartz not only carries free gold in ahundance, but is largely composed of sulphurets.

NEVADA COUNTY.

BLOOMFIELD.—Nevada *Transcript*, April 17: The North Bloomfield G. M. Co. is running about 3,000 inches of water, with better prospects than ever hefore.

Haner & Brockmyer, Columhia Hill, are at work and doing well.

The Yuba G. Co. at the head of Hnmhug creek have machinery on their ground run by a hnrdy-gurdy. The Co. will soon put on an engine, and start up to thoroughly prospect their ground.

ITEMS.—At North San Juan, the claims of Powers, Davis, Beach and others are paying well. Daueke & Co.'s claims, on San Juan Hill are also paying first-rate. There is a prospect that other Co.'s owning claims on the same hill will start work soon. The American M. Co. at Sebastopol are realizing splendid dividends. About 60 hands are employed. The claims of Miller, Furth & Co. on the south end of Manzanita Hill, near Sweetland, are idle. The Co. are running a tunnel, which when completed will enable them to work every foot of ground on that end of the hill. It will be finished next fall. The Buckeye claims below Sweetland are paying well. A large numher of men are employed. Under the auspices of Bell & Co., French Corral, a new ditch is projected to carry water from the Sonth Fork of the Yuba to all points on the ridge below Cherokee. It will he ahout 20 miles in length, with a capacity sufficiently large to carry from 2,500 to 3,000 inches of water.

NORTH BLOOMFIELD CO.—The Co. are running nearly 3,000 inches of water in their ditch, and using about the same amount at Bloomfield and Columbia Hill.

LIBERTY HILL.—A. J. Doolittle has purchased extensive claims, and is going to work immediately to fit them up for extensive work.

LOCATIONS.—The Round Mountain Quartz Co. have located 80 ft. upon the Round Mountain Quartz Ledge, Nevada Township, commencing on the West of the South Yuha Quartz Co.

Casper & Co. have located 300 ft. on a quartz ledge, on Gold Flat, commencing at a shaft at the northerly line of the Wheel Quartz Co.

Isaac Adair & Co. have located 300 ft, commencing at the southerly line of the Wheel Quartz Co.

The South Yuha Quartz Co. have located 1,000 ft on the South Yuha Ledge, Blue Tent Dist. Nevada Township, with 100 ft. on each side of the ledge.

DIGGINGS OPEN.—The claim of Gentry & Co., Oustomah Hill, were opened on Tuesday, and will he ready for work soon. Yesterday, 8 or 10 men were employed siding up the flume preparatory to hoisting.

CLEAN UP.—Grass Valley *Union*, April 16: The gravel claims on Bunker Hill are turning out well. On Saturday, McCauley & Roberts cleaned up after 3 weeks ruu, 2 men working, $1,200.

CHISPA.—Last Saturday, Hans Roberts picked up on hie digging a lump of gold weighing 16 oz.

PLACER COUNTY.

OPHIR DIST.—Auhurn *Stars and Stripes*, April 18: The priucipal ledge is the "Black Republioan," upon which a large shaft is being sunk. This shaft ie down hetween 90 and 100 ft. with a well-defined ledge of from 14 to 20 inches in thicknese. The quartz taken therefrom has averaged about $16 per ton. On an extension of the same ledge is the mine of Rhodes & Co. There is a shaft down nearly 100 ft and they are still siuking on a widening ledge. Their last crushing was 33 tons of unassorted rock, which yielded about $23 per ton.

The Greene Mine main shaft is down about 235 ft., driving through quartz that will yield an average of $100 per ton. At the the point of present operations the ledge avorages about 15 inches.

The Bellevue Co'e claims emhrace 8 distinct ledges. Ou the principal ledge a shaft has been sunk near the crest of the hill. This shaft has reached nearly 140 ft., through fine milling rock, frequently showing free gold to tho naked eye. Crnshings have been made to the extent of 400 tons, yielding an average of over $30 per ton. On the same ledge a tunnel is being run from the westward, at the level of Doty's ravine. This tunnel, at 1,550 ft. from its mouth, will tap the shaft at a depth of about 179 ft and will drain off all the surface water of the hill. The tunnel has followed the ledge for ahout 200 ft., largo portious of the quartz showing a dazzling richness in silver and gold.

PLUMAS COUNTY.

EAST BRANCH.—Quincy *National*, April 13: The Taylor Hill Co., Taylor Hill, will soon get to work. They have got their claims in splendid condition for a season's run. The Pea Soup Co. have purchased the old Mill Creek flume for $400, and are putting it in good repair. The Bunker Hill Co., Oak Flat are working a strip of front ground which was left hehind some years since. John McCorkle, in Oak Flat ravine is running his hydraulic, with splendid prospects. Operations will probably he resumed on the Indian Hill claims this season. Marner & Moore are about to open the ledge on French ravine where the very rich pocket was found some years since—some $1,800 having been taken out of a very small quantity of rock. McDougal & Co. are at work in French ravine, with fine prospects.

SAN DIECO COUNTY.

BULLION.—San Diego *Bulletin*, April 10: W., F. & Co. shipped yesterday $5,876 in bullion, all from the Julian mines.

THE MINES.—San Diego *Union*, April 11: A clean up of ore from the Owens' ledge shows that the grade has advanced from $17 to $50 per ton. Eighty tons were crushed which yielded $4,000 and the mill has commenced running upou another lot, which it is expected will yield $75 per ton. This ore is from the depth of 225 ft., where the ledge is 5 ft. wide and easy to work.

THE Antelope has just cleaned upa small lot from the Madden mine which yielded $117 per ton.

STONEWALL CO.—The Co. has purchased the 40 horse power engine owned by Allison & Co. Five more stamps will be purchased, to be ruu by this engine.

SIERRA COUNTY.

BUTTES MINES.—Downieville *Messenger*, April 13: The 3 mills are in splendid working coudition. About 165 men are employed. The daily running expense is $500.

HIGH COMMISSION LEDOE.—The result of crushing 40 tons of ore to April 4th, is as follows: Working mill process, plates, $600; hattery tailings, $200; specimens, $300; 5 tons of mill tailings ehow freo gold.

MINING.—Yreka *Journal*, April 17: Several Portuguese Co.'s have been doing a flourishing business ground eluicing this winter on Long and Canal Gulches, above the hig ditch. They will now commence washing up the rich pay dirt, which yields largely.

The Chinese Co., that hought the old Jack Davis claim, supposed to be poor pay, took out 3½ lbs. of gold in a single week lately, and are still realizing hig pay.

SCOTT VALLEY.—Cor. same: The Bay City Co. on Indian creek, are picking up nuggots from 1 to 7 ozs. in size.

Daniel Starr is piping on French Gulch with flattering prospects, and Michael Reglan is piping agains this heavy hank at a rapid rate.

Miller & Baker, with their 3-ft. flume and 2 pipes, are making the precions metal appear in abundance.

Major Duncan picked np a 2 ponnd lump in New York Gnlch while ground sluicing a few days ago.

Hinckley & Owens have pnrchased the hoiler and engine of the old Siskiyou quartz mill, and are removing it to the lower end of Indian Creek, to prospect their deep claim.

TUOLUMNE COUNTY.

HOLDEN'S GARDEN.—Sonora *Independent* April 13: The old mining epot, at the head of town, is agaiu to be tried. A Co. of 9 having located ground. J. T McLean has purchased the Rongh and Ready gravel claim, in Tablo Mountain for $2,000.

P. H. Cosgrove & Co. found 2 fine nuggets in their claim, in Main Gulch, last week—one 4 and the other 1 oz. in weight. Hugh Gaffeny fonnd a piece which weighed 7 ozs.

MINES EAST OF SONORA.—Lewis & Bros. have been rewarded in their last clean np; the quartz prospected at a rate of $90 per ton, with plenty more in sight.

RICH CHISPA.—A miner, while at work, last week, on his claim in Blue Gnlch, near Algerine, found a chispa weighing 3½ ozs. valued at ahout $60.

STREET MINING.—Hart, Wooters and Clarke, mining in Washington street are making it pay well. The gold is coarse and heavy.

APP MINE.—The mine is down to the 650 ft. level, where the rock is thickly studded with the preoious metal. The mill is running day and night, with good results.

AULA QUARTZ MINE.—Frank Aula & Co. have commenced runniug a tunnel on a lode they had disoovered, 30 miles from Big Oak Flat, which prospects at the rate of $40 per ton. The lode is 16 ft. wide. They are bnilding an arastra to work the rock.

Nevada.

ELKO COUNTY.

RAILROAD DIST.—Elko *Independent*, April 20: The Supt. of the Highland S. M. Co. showed us yesterday some very rich specimens of ore from the Humholdt mine, assaying as high as $500 per ton. The explorations have reached 100 ft. from the surface, showing a regular and well defined ledge. The Elko Co. has also struck a large hody of fiue ore in its tunnel.

EUREKA DISTRICT.

MAGNOLIA CO.—Eureka *Sentinel*, April 16: The shaft of Newport No. 1 is down 135 ft. following a perfect foot wall, ore permeating the entire shaft. A drift has been commenced, starting at the, hottom of thie shaft with a view of running across the ledge, and its course is about 9¼ ft. from the the foot-wall, going in the direction of the hauging wall. There is a quantity of first class ore on the dump. The Newport No. 2 is showing a fine hody and is being vigorously worked. The Astor, another mine helonging to this Co. has a shaft down 60 ft. in magnificent ore.

DIAMOND DIST.—The developments recently made in the Champion series of mines show splendid hodiee of ore, and the workings are all in rich rock. The drift heing run from the main shaft will soon he made to intersect the tunnel, and indications are strong that ore will be encountered on the way hy cutting the regular vein.

WILL BE RESUMED.—Work will he resumed in a few days on several olaims that have heen idle during the winter.

ARRIVED.—The engine, hoilers and other machinery for the Richmond Co. are all lying at Palisade awaiting shipment.

RICHMOND.—These works will he started up early next month.

STARTED UP.—The furnaces of the Eureka Cou. Co. have started up.

ELY DISTRICT.

BULLION.—Pioche *Record*, April 11: W. F. & Co. shipped to-day hullion valued at $20,-807.48.

CHIEF DIST.—This dist. is 15 miles south from Pioche. There are ahout 80 miners in the dist. The Chief was the first location made, and of the principal we can mention the Silver Wave, Eagle, Black Hawk, Gen. Grant, Vermillion, Muchacho, and Tahor. The first named has a ledge 4 ft. in width of fine chloride ore, rich in horn silver, and has on the dump ahout 50 tons of ore that will work well.

HUHN & HUNT.—Work is heing carried on hy a full force of men; the incline is down 60 ft. below the level of the tunnel; the ledge shows hetter and larger the deeper work extends. The ledge at the lower level is full 4 ft. wide. The ore is of a very fine character and there are over 250 tons on the dump.

HUMBOLDT.

THE STARLIGHT CO.—This is one of the most active in the district. They are turning out good milling ore, with every prospect of striking a large hody of ore soon.

BULLION.—Unionville *Silver State*, April 20th: Amount shipped from the Arizona, eince our last issue, was $6,387.

MANITOWOO.—For some time past a force of men have heen at work. The developments made are most satisfactory. A drift is heing run to connect with the works of the old S. M. Co.

NATCHEZ.—The mine is looking better than at any time since the Twiss hrothers commenced work upon it.

BATTLE MOUNTAIN DIST.—The English Copper Co. is working quite a force of men, while many other small companies are taking out and shipping considerahle quantities of copper ore. Senator McBeth is pushing work on the Battle Mountain with very flattering prospects. The White mine has a limited numher of men at work. They are bringing to the surface considerahle quantities of shipping ore.

EAGLE.—This mine, in Indian Dist., is heing actively developed, 3 shifts of men heing employed in ginking a shaft. The ledge, 8 ft. wide, has clearly defined walls, and assays of ores taken from different parts give satisfactory results.

ARIZONA CONS.—An important strike was made at the extreme southern part of the works this week. For some distance the workmen have heen running in hroken up ground, where the ledge seemed to he pinched out, hut they have now reached a well defined ledge heyond this ground, demonstrating that it continues to the southward in that direction.

WASHOE.

BULLION.—Reno *Crescent*, April 20: Amount shipped for the first 19 days of April, was 43,-894 lbs.

Virginia *Enterprise*, April 18: Hale & Norcross Co. yesterday cut their lead on the 1,500 ft. level 48¾ ft. southeast of their incline. They tapped some water and cut into good ore. Ou the 1,400 ft. level they have drifted 33 ft. This ore is said to he equal in richness to Crown Point. There are streaks in the new body that go as high as $3,000 to $5,000 per ton.

The Caledonia Co. will soon-be taking out ore from 2 levels, and heeides have struck ore in their shaft.

The Knickerbocker, Globe, Caledonia and Utah and other Co.'e are all actively developing their mines.

During the past week 600 tons of ore was taken from the Savage, assaying $47.68 to the ton. Hale & Norcross yielded 540 tons for the same period.

The drifts south on the 1,100-ft. level of the Ophir are heing pushed steadily forward. The drift west from the shaft on the 1,300-ft. level being pushed night and day. When the drift on the lower level cuts the lead half a dozen cross-cuts will be made on the 1,100 ft. level.

The Eureka mill is working splendidly.

The water will he out of the Justice in ahout

2 days when the old east drift on the 410 ft. level will be pushed ahead.

All the mills on Six and Seven-mile Cañons are in active operation on Comstock ores.

The Lucerno Co. has commenced building its new hoisting works in Gold Cañon this side of the Devil's Gate.

The ore body on the 1,400-ft. level of the Hale & Norcross is improving.

The new development in the savage is looking well and is daily improving.

We yesterday saw at the bank of Cal. 22 bars worth $66,023.11 from the Belcher and Crown Point.

Local Summary.—Gold Hill *News*, April 13: Belcher.—Daily yield, 285 tons, from the 1,100 ft. level, assaying from $90 to $120 per ton. The ore has been stoped out 265 ft. south from the Crown Point line, and the breasts are still in splendid ore. Above this level the ore-body is being stoped out to the hight of 6 floors showing no deterioration of quality, and holding in width. At the track floor of the level mentioned the ore-body is 95 and 100 ft. wide, and at the fourth floor above it is worked to the width of 80 ft. and no east wall yet reached. The floors above are not worked so wide as yet. A continuous winze connection through from the 1,100 to the 900 ft. levels is made for air and for sending down ore and waste. At the 900 ft. level a cross-cut develops 32 ft. of good ore, showing a continuous body through to the lowest level. The south drift at the 1,100 ft. level is in 540 ft. from the Crown Point line, and the face is in porphyry. The drift from the bottom of the winze connecting the 1,100 and 1,200 ft. levels, 60 ft. south of the Crown Point line, is completed through to the Crown Point 1,200 ft. level, giving a good air circulation. In the old upper mine the main working incline is down 318 ft, below the 850 ft. level, and is being rapidly sunk deeper by 4 shifts of miners working 6 hours each. The foundations for the two new 90 horse power hoisting engines are being prepared, the pump engine is in place ready to work, and the pumps are about all placed. All the machinery will be ready to run in about a month of 6 weeks.

Savage.—Owing to lack of milling facilities, is producing but a few tons of ore per day. There is at least 2,500 tons in the dumps awiting transportation and milling. The drift south from the incline, at the 1,500 ft. level is in 80 ft. and has 40 ft. further to run to reach a point directly beneath the good body of ore found in the level above. It progresses at the rate of 4 or 5 ft. a day. The winze connecting the 1,300 and 1,400 ft. levels is 350 ft. south of the incline and 80 ft. north of the Hale & Norcroes line.

Hale & Norcross.—The main incline is 50 ft. below the tenth station, or 1,500 ft. level, and to-day the pump is being put in place below the level. The excavation for the station at this point is completed, and a drift is being run to cut the vein directly east of the incline. This drift will reach the vein within 3 or 4 days At the next etation above (the ninth) they are running a drift north in the west wall, cloee to the vein, which it touches in some places.

Daney.—The shaft is down 524 ft. and still sinking wit good progrees for the 600 ft. level. The drift on the 500 ft. level is in 160 ft. north on the vein, with favorable indications. The work done at present is confined principally to drifting on the 500 and sinking the main shaft. At 650 ft. the expect to encounter the vein in the main shaft.

Crown Point.—The daily yield continuee unabated. All the ore breasts are looking splendidly. The yield for March wae 10,753 tons, of the milling value of $630,848.01, averaging $58.67 to the ton.

Virginia.—The drift being run from the Gould & Curry to prospect the Cons. at a depth of 1,167 ft. hae euddenly been discontinued.

Kentuck.—From 38 to 40 tons of ore per day is the present yield, gleaned from the old workings about the 500, 600 and 700-ft. levels. This keeps the Devil'e Gate mill running steadily. The drift through the 1,300-ft. level being run from each side by the Crown Point and Yellow Jacket Co. for air connection, is progressing fast.

Ophir.—The drift west, toward the vein, at the 1,300-ft. level, ie in 42 ft., and is expected to intersect the vein in 3 weeks. At the 1,100-ft. level the south drift ie in 145 ft. from the shaft, cutting through several streaks of quartz and developing very encouraging indications of ore, the quartz giving small assays of eilver and gold. The north drift ie in 117 ft. with less favorable indications.

Buckeye produces abont 35 tons of ore per day—all gold ore.

Sutro Tunnel.—The sinking of the air shafts along the line of the tunnel is progeesing favorably. The tunnel is in 2,832 ft., the face being in very hard blasting rock, no very fast progress can be made. There are 225 men employed in running this tunnel and einking the air shafts.

Justice.—The water in the shaft will be all pumped out by the middle of next week, when the drift eaet at the 500-ft. level will be cleaned out and finished through to the ledge. It is in 90 ft., about 30 ft. further will reach the ledge, when good ore is expected to be found.

Yellow Jacket.—The main incline is 40 ft. below Sntro Tunnel level, encountering no water yet.

Imperial Empire.—The incline from the bottom of the ehaft is being sunk at a satisfactory rate, in hard blaeting rock. The etation at the 1,600-ft. level will soon be opencd. No water is found in the incline.

Knickerbocker.—New shaft down 180 ft. The new hoisting works are ready for operation.

Overman.—New shaft 712 ft. deep and the bottom is hard porphyry, which blasts well.

Succor.—The new shaft was commenced this week, and will he sunk rapidly.

Chollar Potosi.—Daily yield, 150 tons, all from the old workings. Average assays $41.50 per tou.

Globe.—About 4 ft. of very good oro is reported found in the old upper workings. At other points the Globe is being actively prospected and developed.

Gould & Curry.—The uew hoisting works will be completed in ahout a week, when operations will be resnmed.

Sierra Nevada.—Daily yield, 50 tons, from the uew ledge, keeping the Co.'s first mill steadily running.

WHITE PINE.

Bullion.—White Pine *News*, April 13: W., F. & Co. shipped to S. F., for Bowery M. & M. Co., Pioche, 7 bars, 421 lbs., valued at $7,265.43.

Treasure Hill Mines—Ward Beecher.—Siuking winze from bottom of Philpotts chamber to connect with east drift from Lady's chamber.

North Aurora.—Working to the south. Making fair headway. The tunnel running from the South Aurora to connect with the Risdale chamber progresses rapidly.

East Sheboygan.—Breasting out in ore chamber. Ore improving in grade.

Copper Glance.—The drift running ahead to find the extent of the ore body is pushed rapidly.

San Juan del Rio.—There is one shift employed sinkiug the shaft. Hoistiug ore and piling on the dump.

Arizona.

Mines and Mining—Yavapai Co.—Prescott *Miner*, April 6: Wm. Linu, owner of a claim in the Tiger, Bradshaw, informed ue this week that richer rock than any yet shipped to S. F. was being raised. Other ledges in the Dist. were producing plenty of rich rock.

A note from the Supt. of the Del Pasco mill and mine, assures us that work was progressing very favorably. The mine was yielding a great deal of high-grade milling ore. The mill (4-stamps) was being run from 12 to 14 hours each day, with a result of about $260 for said work. The Supt. is making arastras which will be ready for work eoon.

Vulture.—The famons mine and mill at Wickenburg, are yielding plenty of gold.

Benjamin.—Abont 5 tons of ore are on the dump, ready for shipment.

The mill which Frederick & Hammond are setting up on the Hassayampa, will soon be ready for crushing.

The newe from Walnut Grove and Weaver Dist. continues good.

Mr. Kerr, of Fort Rock, informs us that some ledges near his place were being prospected.

Joe Voshay and othere talk of striking ont, soon, on a big proepect.

There is talk of raising a Co. to prospect Diamond river.

Ex-Lient. Wm. McK. Owen, found, one day last week, near the Benjamin, a fine looking ledge of very rich silver rock.

Mohave Co.—E. M. Smith has invested about $30,000 in mines, and is still engaged buying more.

Several mines have changed hande. The Empire, Schuyler and Schenectady have been sold, and to-day the Seventy-Two, No. 2, is reported sold.

Coover'e furnace, at Chloride, and Edgar's at Cerhat, are going up fast. The mill etarts in the morning on Lone Star rock.

Yuma Co.—Many mines of Castle Dome and other diste., bordering the Colorado, are being worked up.

Colorado Riven Placers.—There is considerable talk abont the placer diggings recently discovered on bars of the Colorado, near Black Cañon. All the accounte seen by us, state that the bars contain sufficient gold to remunerate miners for working them.

Colorado.

Items.—Colorado *Miner*, April 11: Siuce ont last report, Baily & Nott have shipped 19 tons of the 250 tons of ore on hand.

The Baker Mill will be rebuilt this spring. The Matilda Fletcher lode, Bard Creek Dist., Republican Mt. It is a sulphuret lode and has had pay in sight from the discovery. It is opened by a tunnel at the discovery on the vein, 147 ft in length.

Georgetown.—Cor. same: The work of constructing smelting works at Swansea, about 3 milee below Georgetown, has commenced. Work will be resumed in a short time on the Burleigh tunnel.

The owners of the Pelican are driving a long tunnel to strike their mine at a reepectable depth from the surface.

The Zephyr is eitnated a short distance below the Pelican. The pay ore vein ie large and continuous. In one place we noted a breadth of nearly 3 ft of solid ore, of great richness. The ore ie high grade and the mine a broad gange one.

The Eagle Bird is a short distance below the Zephyr. The mine is being placed in complete working order. The ore taken out, up to-date, has paid all expenses of work done, and left a handsome profit.

The Corry City vein shows a breadth between walls of about 25 ft. A tunnel cuts the vein at about 40 or 50 ft. from the enrface. At present there are from 3 to 4 ft. of pay vein matter in sight, that yields by mill treatment 50 ozs. per ton.

Golden.—Central *Register*, April 10th: The Jefferson C. and M. Co. have their mine well opened, and 4,000 tons of coal broken and ready for delivery.

Excavations for the foundation of the blast furnace are being made on the grounds of the B. & C. S. Co., for the treatment of silver-lead ores. During three days of the past week this Co. paid out over $8,000 for silver ore from Clear Creek.

The Ophir mine on the Kansas lode, as worked by Roberts & Co., is yielding a handsome profit. The shaft—350 ft. in depth—has been securely timbered from top to bottom. On each side at the bottom two drifts are being driven, both of which disclose a handsome vein that will average nearly 3 ft. of solid ore.

Canton.—Cor. same: The Wahash lode is looking fine. Geo. C. Corning & Co. have organized a large Co. in the East, for the purpose of working the mine, and to erect reductiou works at some suitable place in this county.

We were shown a letter from Pattersou & Mullen, who have formed a Co. with $140,000 capital, for the purpoeo of erecting smelting works at this place.

Idaho.

Local Record.—Silver City *Avalanche*, April 13: The 5th level cross-cut, after being run east 20 ft. interscted the ledge which has a very fine appearance, 18 inches in width, with ore that will mill $60 per ton. The quartz is of a soft nature; and on the casings each side, very rich silver and gold hearing rock is found. At the 4th level, 15 ft. from the cross-cut south, a winze is heiug sunk in which there is a ledge of first grade ore, 16 inches wide, showing that the chute of ore runs clear through the 5th level. In the south drift, 4th level, the ledge is small and split up, so that it has been found necessary to run in the west wall in order to keep on the vein.

South Chariot.—As many men as can profitably he worked are employed in straightening the shaft from the 2d to the 4th level. The foreman will commence sinking on the vein below the 4th level in connection with straightening the shaft above. The ledge in the 4th level drift is large but not of sufficient quality to save for milling.

Minnesota.—The stopes between the first and second levels, both north and south of the shaft, continue good, sending out 14 tons of good grade ore every 24 hours, which is figured on at abont $55 per ton. Working force, 32 men.

Golden Chariot.—The work of straightening the shaft is being carried on in the most expeditious manner.

Elmore.—The shaft is once more on its downward course. A large tank has been put in at the 7th level, and all the water at this point is taken into it. The 7th level drift north has improved during the week, showing a ledge 2½ ft. in width of ore worth from $40 to $45 per ton. The ore is not of very high grade, but there seems to he an abundance of it.

Empire.—The contractors are at work sinking the new shaft below the adit level. The ledge looke well thronghont and varies in size from 1 to 2 ft. The ore is high grade.

War Eagle.—Thie claim is turning out well, and shows an abundance of good ore all throngh.

Lower California.

McKeane Mill.—San Diego *Union*, April 11: The machinery has all heen put up, and the work of crnshing will commence the first of next week. The Co. have a large amount of low-grade ore which it is expected will yield about $20 per ton.

Montana.

Blackfoot.—Deer Lodge *Independent*, April 13: Four Co.'e have been working all winter near the head of Upper Ophir gulch, drifting and washing with good results. Pat. Carr & Co., on Illinois gulch are engaged ground-eluicing, and all other miners are making extensive preparations for a prosperons season's work.

German.—Work is going on on all the claims in German gulch, from the California Co. down to the cañon.

Utah.

Bullion.—S. L. *Tribune*, April 16: W., F. & Co., received on Sunday 13 bars, from the American Flag, worth $11,532.21, for shipment to New York.

Vallejo Tunnel.—This tunnel in Little Cottonwood, and completed 350 ft., hae led to a rich deposit of galena ore filling the whole face of the cut. The valne of the ore varies from $125 to $200 per ton, silver.

Illinois Tunnel.—This tunnel has been run about 440 ft. and a drift from it hae led into a drift from the Emma.

The Titne, a new mine in Little Cottonwood, is taking ont a large quantity of valnable ore.

Deep Creek.—The Grand Deposit is 150 ft. wide. J. F. Berry & Co. are running a furnace which is turning ont abont 2½ tons of bullion per day.

Columbia Dist.—There are 124 claims recorded, and in nearly every instance where assessment work has been done, Galena and Carbonate oree have been exposed.

Silven Cloud.—The main shaft is 55 ft., from which they have a tunnel of 165 ft. in which a remarkable sight of rich ore is to he seen.

At Stockton Jacohs & Co. are about erecting extensive smelters.

East Tintic.—Cor. same: The principal leads being worked are the Bowers, Alice, Jefferson, Rising Sun, Elephant and King Philip; all excellent leads.

An important work has just commenced here, the running of a tunnel through the Rising Sun Hill.

West Mt. Dist.—Cor. same: In Black Jack Gulch are mines that are yielding ores in sufficient qnautity that carry silver into the hundreds of ounces per ton, while the Winnamnck mine has been taking out ores that run from $1,000 to $1,200 per ton.

Many new and valuable discoveries have been made, among which is a splendid vein of galeua and chromate of lead 10 ft. wide, also some mines of gold bearing quartz. The placers are doing well.

The Winnamnck, in Bingham, is looking better than nsual, and opening out rich bodies of ore.

The famous galena lode near the head of the cañon is well developed and shows immeuse bodies of carbonate of lead.

The Saturn Co. have run a tunnel 125 ft., cutting the vein 115 ft. from the surface. At the end of this tunnel they have sunk a shaft which is down 80 ft., in mineral all the way.

North Tintic.—A drift has been run on an incline, to ascertain the width of the vein, for 20 ft. on the Black Crook mine, and still there is no indication of the opposite wall being near at haud. The drift has so far passed through solid ore without any interruptiou of outside or non-paying rock.

The next leading miue is the Metropolitan, It is a vein 4 ft. wide.

San Francisco Stock and Exchange Board.

San Francisco, April 25, 1872.

The sales at the Stock Board during the past few weeks have been enormous; for the week ending the 19th inst. they amounted to $8,494,400. The sessions are protracted and business heavy. There is no apparent abatement in the excitement and prices are nnparalelled. This has heen especially the case in Virginia and Gold Hill stocks. The number of new incorporations being placed on the market is unnsual and most of them find ready sale.

The Redington Quicksilver Company held a meeting on the 18th and elected John H. Redington, Horace P. Livermore and Geo. W. Cornwall Trustees. Chas M. Peck was continued as Secretary. Crown Point sold at $1,500 on Monday, cqnal to $30,000 per foot, the highest price ever paid for any mine in the United Statee. A nnmher of others have, during thie excitement, risen higher than ever before. The Mahogany mine has shipped this week $4,862. The Chollar Potosi mine yielded last week 824 tons of ore assayiug $42.52 per ton and the Crown Point yielded 2,700 tons, valued at $167,186. Abont 750 tons of ore were taken from the Hale & Norcross mine last week. The ore in the 1,200-ft. level of the Belcher assays $358 per ton.

The Trustees of the Home Ticket S. M. Co. have elected S. S. Tilton President, C. F. Balcom Secretary and P. H. Smith Superintendent. The Huhn and Hunt S. M. Co. have elected the following Trnstees: N. C. Fasset (President), L. A. Booth (Treaurer), E. Huhn, J. Clark, A. E. Head, Geo. D. Soberts, and E. B. Ball. Louis Kaplan is Secretary.

The Raymond & Ely mine has sent down $31,800, making $220,400 for the first 21 daye of the month. Between April 8th and the 24th $55,700 has come from the Meadow Valley mine.

The Hale & Norcrose Company, which recently doubled its capital stock, proposes to treble the recent increase. The Belcher Company also propose increasing their stock from $1,040,000 to $10,400,000. The Stock Board held no session this morning on account of the death of a member.

A bill granting pre-emption rights te settlers on the mountain lands in California has been eigned by the President.

The Big Mill of Nevada.

We, day before yesterday, paid a visit to the new Eureka mill, situatsd on Carson River, ahout half way hetween Empire City and Dayton. This mill is prohahly to-day the largest and best mill in the world for the reduction of silver ores. It is certainly the best mill in this State, where are located some of the hest mills now known for workiug ores hy the process at present in nse. The planning of the mill and all connected with it was done hy Mr. A. Edgington, Superintendent of the affairs of the Union Mining and Mill Company, though the particular points in the work were carried out by Mr. Fonntain, who took hold of it as sketched out and hrought ths whole to its presant state of perfection. Our hest plan of describing the grand works we have named appears to he to follow the course of the ores from the Comstock lode. These, then, we may say are shipped over the Virginia and Trnckee Railroad to a point ahont one and three-quarter miles ahove the mill, where there is a switch made for the accommodation of the cars carrying ores to this particular mill. Being run off on this switch or side track the cars are dumpsd into

The Chute.

This chute is 350 feet in length and 14 feet 3 inches in width. It is divided throughout its whole length hy a central partition of two-inch planks, and its hottom is lined with iron, in order to facilitate the sliding down of the ore and to guard against wear. The chute stands at an angle to the horizon of 36 degrees, and it is found that the ore very freely passes through it to

Ths Dump,

Which is situated at its hottom, and which is 36 feet wide, 18 feet deep and 16 feet high. This dump is also divided through the centre by a strong partition. The object of these divisions in the chute and dump is that two kinds of ore may he sent down and kept separate. The dump and chute are capable of holding 1,000 tons of ore, and both are most suhstantially constructed. From this dump the ore is taken into the cars which run upon

The Narrow Guage Railroad,

And over it is conveyed to the mill helow. There are now in nse on the railroad ten iron ore cars, each capahle of holding four tons of ore. The grade of the road is 30 inches (down) to the mile, and the distance from tho dump to the mill is one mile and three-quarters. The cars are loaded in a few minutes hy means of gates fixed in the lower part of the dump, and raissd and lowered hy means of wheels working into proper gearing. Horses are used to haul the empty oars up from the mill, hut when filled they travel the down grade to the dam without any further attention than that of the hrakeman, who mnst he on the lookout to prevent their running too rapidly. They generally go down abont as swift as anyone would care to travel over any railroad. The road follows tho northern hank of the river, and, passing over the dam, continues thence to the mill over the flume which carries to the mill the water hy which it is driven. In company with Mr. Edgington, Mr. Fountain and Mr. King, Superintendent of the mill, we took a ride from the mill to the dump and hack over the flnme to the mill—nsing horses in going up and coming hack the greater part of the way without any other aid than that of gravitation. It is wonderfnl to sse how docile and well-behaved are all the horses in passing along the narrow track on the top of the flnme. They all seem to know that it is hetter to keep to the track than to jump off, and in this they exhihit good "horse sense." In passing, we may say of

Ths Dam,

That it is probahly the largest and most suhstantial in the State. It is constrncted of 14-inch square timhsrs, cribbed—first, a tier down the river, thsn one across and thus alternating to the hight of 26 feet. The dam is 200 feet in length and built arching up the river. The cross-section is triangular with the lougest side for hase. The up-stream side of the dam is ou an angle of 60 degress, aud the down-stream side on an angle of 45 degress with the perpendioular. It backs the water up the river hed for about one mile, and in its construotion there was used ahout 400,000 feet of timher.

The Flume

Is 12 feet wide, four feet four iuches high and three-fourths of a mile in length. For thie whole distancs it is set upon a trestle-work which averages 12 feet in hight. It is capahle of carrying no less than 60,000 gallons of water per minnte. After the ore comes down over the narrow-gauge road to the mill, it is necessary to elevate it from the track to the hight of 50 feet, to hring it to the proper hight ahove the hatteries. This is done hy means of an

Inclined Tramway.

Up this tramway the cars are hauled three at a time. It is 250 feet in length, and the cars are hanled up hy means of a steel wire rope seven-eighths of an inch in diameter and 370 feet in length. This cahle is reeled around a hoisting drum which is situated at the extreme end of the ore-house on the top of the mill. In planning this hoisting arrangement Mr. Fountain had several diffioulties to overcome, and he has done it very cleverly. To make this understood we may say that, where the rope enters the mill, it has to change its direction in two different ways. This is done hy a series of pulleys, one succeeding another to the nnmber of six. These pulleys had to he so constructed so as to allow the cars to pass over them, and at the same time allow the rope to he perfectly free from them before the cars reach them, and to receive it again when the cars have passed them on the down trip. When the cars have hsen hauled up to the

Ore Houss

They are dumped by removing a catch which throws open a door in the bottom and the oro drops npon an inclined screen constructed of 1¼ inches round iron bars, set ahout 2¼ inches apart. This scresn allows the rock, which is suitable to enter the mortars, without breaking, to drop hetween the hars and in a convenient position in front of the hatteriss. The rock which is too large to go through the soreen is deposited hy the side of the rock-hreaker, and after heing put through it drops in front of

The Batteries.

In all there are in the mill sixty stamps, weighing 940 pounds each. They are so arranged that there are five stamps to each mortar. The stamps drop ninety times per minute and each series of five stamps is run hy an independent belt and regulated by an independent tightener. The faces of the came are all of chilled iron, and all connected with the hatteries is of the most suhstantial and approved character. Below the hatteries are placed

Ths Tanks.

Of these thore are sixteen of a large size for use in settling the sand and elum. The final discharge from the series of tanks is of water almost as clear as that entering the batteries. The sand tanks are located in two rows through the centre of the panroom, at right angles to the hatteries, and the slum tanks are at the extreme end of the mill, parallel with the stamps.

Pans, Settlers, etc.

There are in the mill 24 pans for grinding the saud, placed in two rows of 12 each on either side of the tanks. The capacity of the pans is eight tons each, every 24 honrs, and they are rnn at the rate of 95 revolutions per minute. There are 6 settlers, each 9 feet in diameter, to each row of pans; also two "agitators" and a clean-np pan. The slum tanks are huilt so as to he self-discharging. They discharge the slum through gates constructed for the pnrpose and attached to the outstde of the tanks at the hottom. The slum after heing amalgamated, passes out into the slum settlsrs, two in nnmher, and thence down into the agitators and ont of tho mill, where, together with the sand, it is colleoted in an immense reservoir for future working. This reservoir is situated on the flat helow ths mill, and is capable of holding no less than 860,000 tons.

Ths Water Wheel.

The whole immense mass of machinery of which we have been speaking is driven hy a Leffel turbine wheel, hut 52 inohes in diameter. The fall of the water is 36 feet, and under this head the wheel takes through it 6,800 cuhic feet per minute, giving ont over 400-horse power. The wheel is put in in a manner never hefore attsmpted. Instead of heing fastened to the bottom of the penstock, as is generally the case, thersby making it necessary to transmit the power at right angles hy msaus of bevel gearing, (which occasions an irumense amount of friction and an occasional hreakage of gearing,) this wheel is boltsd directly to the side of the penstock eo that the main shaft ruus horizontally through the opposite side of the penstock and carries the two main driving pulleys. These pulleys are teu fest iu diameter, aud run at tho rate of 155 revolutione per minute. Over these pulleys run helts 30 inches in width, which transmit the power each way to the line ehaft, under each row of pans. After passing through the wheel the water is discharged through the side of the penstock and down through a large petticoat made of hoiler iron, and in the shape of an elhow, into the tail-race hslow, whence it returns to the river. This tail-race is 800 feet in length, and of an average depth of 10 fset, and a width of 12 feet. Through its whole length there are stone walls on both eides. By extending the tail-race to the distance named, the water is disoharged considerahly helow the level of that in the river opposite the mill, and ahout two feet fall is gained.

Heating and Retorting.

Under the roof of a wing of the main huilding is placed a large steam hoilsr, where the water used in the pans is heated, and here also is the retorting furnace, where all the amalgam is retorted. Above the whole huilding is an immense water-tank, kept full hy means of a powerful force pump, and from this comes the supply of water nsed in the hatteries and the whole lower part of the mill. A building, situated a short distance from the mill, has been erected solely for the purpose of storing kerosene and other oils, and for cleaning and filling lamps. Thus is avoided one great source of danger to all mills. Ahout the whole of the works there is nothing that has not been thought of and provided for, and in looking at all that has been done one cannot but admire the genius of those who have planned and executed all. Although our article in regard to these immense works has extended to a great length, we find that we have left out many things worthy of mention and but little less interesting than what has heen described.—*Virginia Enterprise, April 9th.*

Water Rights.

The followiug are the provisions of the Code relating to water rights, and the Act to put the same into effect approved March 27, 1872:

Sec. 1410. The right to the use of running water flowing in a river or stream or down a cañon or ravine may be acquiredhy appropriation.

Sec. 1411. The appropriation must be for some useful or heneficial purpose, aud when the appropriator or his successor in interest ceases to use it for such a purpose, the right ceases.

Sec. 1412. The person entitled to the use may change the place of diversion if others are not injured by the change, and may extend the ditch flume, pipe, or aqueduct by which the diversion is made to places beyond that where the first use was made.

Sec. 1413. The water appropriated may be turned into tbe cbannel of another stream and mingled with its water and then reclaimed, but in reclaiming it the water already appropriated hy another must not be diminished.

Sec. 1414. As between appropriators, the one first in time is the first in right.

Sec. 1415. A person desiring to appropriate water must post a notice, in writing, in a conspicuous place at the point of intended diversion, stating therein:

1. That he claims the water there flowing to the extent of (giving tbs number) inches, measured under a four-inch pressure.

2. The purpose for which he claims it, and place of the intended nse;

3. The means by which he intends to divert it and the size of the flume, ditch, pipe or aqueduct in which he intends to divert it;

A copy of the notice mnst within ten days after it is posted be recorded in the office of the Recorder of the county in which it is posted.

Sec. 1416. Within twenty days after the notice is posted, the claimant must commence the excavation or construction of ths works in which he intends to divert the water, and must prosecute the work diligently and uninterruptedly to completion, unless temporarily interrupted by snow or rain.

Sec. 1417. By "completion" is meant conducting the waters to the place of intended use.

Sec. 1418. By a compliance with the above rules the claimant's right to the use of the water relates back to the time the notice was posted.

Sec. 1419. A failnre to comply with such rules deprives the claimants of the right to the use of the water as against a subsequent claimant who complies therewith.

Sec. 1420. Persons who have heretofore claimed the right to water, and who have not constructed works in which to divert it, and who have not diverted or applied it to some usefnl purpose, must, after this Title takes effect, aud within twenty days thereafter, proceed as in this Title provided, or their right ceases.

Sec. 1421. The Recorder of each county must keep a book, in which he must record the notices provided for in this Title.

Sec. 1422. The rights of riparian proprietors are not effected hy the provisions of this Title.

An Act to put iuto effect the provisions of the Civil Code, relative to water rights.

[Approved March 27, 1872.]

Sec. 1. Title VIII of Part IV of Division Second of the Civil Code of the State of California shall be in full force and effect from aud after the first day of May, eighteen hundred and seventy-two.

Sec. 2. The Revision Commissiou are hereby authorized to cause to be printed and certified by their Chairman, twelve hundred copies of Tittle VIII, in pamphlet form, and to distribute them to the members of the Legislature and county officers of the several counties.

Sec. 3. This act shall be in forco from and after its passage.

The Use of Earthquakes.

The usefulness of earthquakes was a favorite subject with the late Sir John Herschel. Were it not for the changes in the earth's crust which ars constantly being effected by the action of suhterranean forces, of which the earthquake is the most active manifestation, there can bo no doubt that the action of the sea boating upon the land, together with the denuding power of rain, would inevitably cover the entire earth with one vast ocean. "Had the primitive world been constrncted as it now exists," says Sir John Herschel, "time enough has elapsed, and force enough directed to that end has been in activity, to have long ago destroyed every vestige of land." Mr. Proctor shows most clearly the beneficial manner in which the restorative action of the earth's subterranean forces is arranged. Of course, every upheavel of the surface must be either accompanied or followod hy a depression elsewhere. "On a comparison of the various effects, it has been fonnd that the force of upheaval acts, (on the whole) more powerfully under coutineuts, while the forces of depression act most powerfully (on the whole) under the hed of the ocean. It seems as if Nature had provided against the iuroads of the oceau by seating the earth's upheaving forces just where they are wauted."—*Scientific American.*

A New Ditch Enterprise.—Surveyor Keddie, in company with Col. Rockwell, left town on Thursday last for the purpose of making a preliminary survey to ascertain the practicability of briuging the waters of the Middle Fork of the Feather through the low gap at Willow Ranch, near Nelson Point, from whence the ditch could hs extended so as to cover the highest points of the Hnngarian Hill country, and, if necessary, to furnish wator to several other mining localitiss. It is thonght hy those who have studied the topography of the country that it will only be necessary to run up to "the Notch," a very narrow place on the Middle Fork, somewhere in the vicinity of Poplar Bar where the water could hs easily taken out and, should this surmise prove corrsct, the ditch would not he over fifteen milos in lsngth—not a very formidahle entsrprise in these days of gigantic mining undertakings. We shall await with some interest the resnlt of the survey, for if successful, it wonld open up an immense field of paying lahor. As soon as the survey is completed we shall endeavor to give the full particulars.—*Quincy National.*

Mineralogical Cabinet.—The Commissioners, consisting of George Cadwalader, Gsorge Rowland and W. R. Waters, appointed hy the Governor, under Act of the Lsgislature, to examine and appraise the cabinet of Dr. J. M. Frey, and ascertain whether the same is worth $13,000, and if so to recommend its pnrohase hy the State, commenced their labors last week; and for the pnrpose of hsing hstter informed as to the full valne of said cahinet, examined a number of mineralogists and scientific men, both here and ahroad, who have seen this cahinet, as to the value theroof. They recommend its pnrchase. The collection includss minerals and precious stones colleoted in Europe, as well as a remarkahly complete cahinet from California, Arizona, Mexico, Utah, Oregon, Idaho, Montana, etc. One of the specimens alone of crystallized gold, was estimatsd to he worth $1,000, and the whole are deserving of heing the property of the State, and to serve as the nucleus of a grand collection.

Smothering a Burning Mine.—Some mouths ago a coal mine at Manch Chunk, Pa., caught fire. The ordinary appliances for extinguishing such fires failing, the company has adopted the plan of a chemist, who has undertaken to extinguish it with ammoniacal gas. The entrance to the mine has been closed up, and in front of it works have been constructed for generating the gas and forcing it into the mines. Two barrels of sal-ammoniac per day are used, and it is helieved that the experiment will be a complete success, and that in a very short time the fire will be completely extinct. Such success will he most important, in fnture cases of fire in coal mines; for there are cases where the fire has lasted for many years, as in the mine at Summit Hill.—*Ex.*

Education, to accomplish the ends of good government should he universally diffused. Open the doors of the school-house to all the children in the land. Let no man have the excuse of poverty for not educating his offspring. Place the means of education within his reach, and if he remains in ignorance, be it his own reproach.

Useful Information.

How to Varnish in Cold Weather.

When varnish is laid on a piece of cold furniture or a cold carriage-body, even after it has been spread evenly and with dispatch, it will sometimes "crawl," and roll this way and that way as if it were a liquid possessing vitality and the power of locomotion. It is sometimes utterly impossible to varnish an article at all satisfactorily during cold weather and in a cold department. In cold and damp weather, a carriage, chair or any other article to be varnished, should be kept in a clean and warm apartment where there is no dust flying, until the entire wood-work and iron-work have been warmed through and through, to a temperature equal to that of summer heat—say eighty degrees. That temperature should be maintained day and night. If a fire is kept for only eight or ten hours during the day, the furniture will be cold even in a warm paint-room. Before any varnish is applied, some parts of the surface which may have been handled frequently, should be rubbed with a woolen cloth dipped in spirits of turpentine, so as to remove any greasy, oleaginous matter which may have accumulated. Table-beds, backs of chairs, and fronts of bureau drawers, are sometimes so thoroughly glazed over that varnish will not adhere to the surface, any more than water will lie smoothly on recently painted casings. The varnish should also be warm—not hot—and it should be spread quickly and evenly. As soon as it flows from the brush and spreads evenly, and before it commences to set, let the rubbing or brushing cease. One can always do a better job by laying on a coat of medium heaviness, rather than a very light coat or a covering so heavy that the varnish will hang down in ridges. Varnish must be of the proper consistency in order to flow just right and to set with a smooth surface. If it is either too thick or too thin one cannot do a neat job.

Insect Wonders.

The recent very general introduction of the microscope is adding largely to the number of explorers into the *minutiæ* of Nature, and new and interesting facts are constantly being brought to light, especially in the insect world. We have here a case in point, which if not absolutely new, will certainly be both new and interesting to most of our readers. We copy from the *Pupils' Gazette*—:

A few days ago, while we sat down under a wide spreading oak, to enjoy its cool shades, and soon were much interested in watching the process of the "Measuring Worm," with which the bushes and trees were covered.

Every few minutes one would suddenly drop from a leaf above, letting itself down by a fine silken web, or thread; but would, invariably, after exploring a little on the ground, return, by its thread, to the same leaf, drawing itself up by it.

After seeing this performed by a number of them, and noticing that they left the coiled web on the leaf, we examined it with a strong magnifying glass, and found by getting hold of the two ends, we could pull it all out into one straight thread. We then examined and unraveled another, and found it to be looped up into a *perfect chain stitch*, precisely such as is made by a single thread sewing machine.

This led us to watch with our glass, the process of this wonderful mechanic in drawing itself up. It would catch the thread with its feet, then stretch up its head, catching the thread still higher up, pulling itself up, forming a slack; then with its feet, put through a loop, which it would hold with one of its numerous feet, till it again grasped the thread above, pulled itself up again, looping up its thread, till it returned to the leaf to which it was attached. It then deposited the coil and left for other parts.

How wonderful and how perfect are all the works of nature. Even the worm teaches us, and many animals, birds and tiny insects manifest more skill than is ever attained by the most skillful human mind.

Transmission of Sound.—The transmission of sound through solid metallic tubes is so perfect that conversation has been maintained in a low tone between the ends of one of the Paris water pipes, 3,120 feet long. The velocity of the transmission of sound is greater, by four to sixteen times, in metal, than air, and in wood, as computed by Chaldini, from ten to sixteen times greater, which is not commonly known. Rock conveys sound so much faster than air that the ear, applied to a stratum of rock in which blasting is being done at a distance, will perceive two distinct reports; that conveyed through the rock first, and afterward the ordinary report in the atmosphere. It has been found that the velocity is also proportioned to the loudness of the report, other things being equal. With 2,000 pounds of powder a report traveled 967 feet in a second; with 12,000 pounds, 1,210 feet.

New Zealand Wood.—There are many woods in the Islands of New Zealand well suited to the highest productions of the cabinet maker. Amongst others is one called by the natives, *Totere*. It is of a peculiar knotted grain of singular beauty, and varied in its character in a remarkable manner. The color is no less rich and effective than the grain, and this wood besides being ornamental in the highest degree is also easily worked and very durable.

Oil Among the Ancients.

The ancients knew no method of refining oil. As a great luxury, they mixed it with perfumes, such as essence of roses and sandal wood; but this rather detracted from than added to the burning properties of the liquid, and all that was obtained by the process was an increase of fragrance and a diminution of light. The dwellings of wealthy men who expended extravagant sums upon scented oils would not have borne comparison in point of lighting with the grimiest top-room of a gas-lit public house. The gold and silver lamps, hung by slender, well wrought chains to marble pilasters, only yielded at their best a lurid tapering flame, that gave out an enormous deal of smoke, fluttered in the slight breeze, and went out altogether at a gust of wind. Neither was it possible to steady the light by closing the apertures through which the air came; for, had Roman or Grecian houses been possessed of glass windows, they would soon have become uninhabitable.

The fresco paintings of Pompeiian villas, the delicate colors on the walls of urban palaces, would in less than a month have been hopelessly coated with lamp soot. At the end of an hour's conference of an evening, a party of noble Romans would have resembled a congregation of chimney-sweeps. A tunic-dyed in Tyrian purple would have acquired a mourning hue in no time.—*All the Year Round.*

Soap Powders; Washing Powders, Day Soaps, Etc.—Under these and similar names, a vast variety of articles are now offered for sale which are said to possess wonderful detergent powers. They are all "old friends with a new face," consisting of soap, soda, either caustic or carbonated, and in some cases, ammonia. The dry soap is not, as its name would imply, an ordinary soap simply freed from the quantity of water with which it is ordinarily accompanied. It consists of a palm-oil soap, saponified in the usual manner with caustic soda, and freed from moisture by treatment with strong brine. In this manner it is rendered so hard and dry that it is capable of being ground to powder. It is then mixed up with caustic and carbonated soda in various proportions, according to the fancy of the manufacturer. Washing pastes are caustic soda lye, thickened with farina. Extract of soap is simply carbonate of soda, reduced to a fine powder without expelling its water of crystallization, and mixed with a little soap and palm-oil. The value of these articles may be easily determined by an ordinary alkalimetrical operation.

Sulphate of Quinine Better than Carbolic Acid.—Solutions of gum arabic and paste made from flour soon mould and sour, and finally lose their adhesive property. To prevent this, carbolic acid has been used; but the odor of the preventive is so exceedingly unpleasant that it is seldom used. It is said that sulphate of quinine is equally as effective, while it imparts no bad odor of its own; and by analogy it is safe to suppose that the same salt could be used to equal advantage in writing ink, mucilage and glue.

Chemical Changes.—The addition of an atom of water to starch converts it into sugar; the substraction of an atom from alcohol converts it into ether. But perhaps the most curious change produced by the removal of an atom of water from a body has been recently discovered by Dr. Matthieson, of London. Morphia, the well-known active principle of opium, is commonly used to allay vomiting, and very often performs the duty very effectually. But when morphia has been heated with hydrochloric acid, and an atom of water has been thereby removed, it is changed into the most active emetic known. It is not necessary to swallow it to produce the effect; a very small quantity introduced under the skin, or even, it seems, spilt upon the hand, is quite sufficient to produce vomiting, which, however, soon subsides, and leaves no nausea afterwards.

Willow Wood.—In England there is no wood in greater demand than sound willow; it is light, smooth, soft, tough, will take a good polish, and does not easily burn. It will bear more pounding and hard knocks without splinter or injury than any known wood, and hence it is used for cricket bats, and, whenever it can be obtained, for the floats of paddle steamers, "strouds" of water wheels, brake-blocks for luggage and coal trucks, the sides and bottoms of carts and barrows, where wear and tear are greatest. To the wood-turner it is invaluable, and were it grown as timber, and obtainable, it would be used for very many purposes to which foreign timber is now applied, and that, too, with considerable advantage both to producer and consumer.—*Cabinet Maker.*

Liquid Blue.—Take half a pound of the best double oil of vitriol, mix one ounce of Spanish indigo pounded very fine, scrape in a little chalk; have an iron pot half full of sand; set this on the fire when the sand is hot, put the bottle in, and let the vitriol, etc., boil gently for a quarter of an hour; take the whole off the fire, and let it stand for twenty-four hours, and then bottle it for use.

Polishing Oak.—Slightly oil the work with linseed oil, and then rub off; then make a paste of whiting and paraffin oil, colored with yellow ochre, or something darker if necessary for the color of wood. After the wood is well filled in with this paste, it must be well rubbed off clean, and let stand two or three hours before the polish is applied.

Good Health.

Open Windows at Night.

Very much has been written on this subject, and written unwisely; the facts are that whoever sleeps uncomfortably cool will get sick. To hoist a window sky-high when the mercury is at zero is an absurdity. The cooler a sleeping apartment is, the more unhealthy it becomes, because cold condenses the carbonic acid formed by the breathing of the sleeper. It settles near the floor and is rebreathed. Hence, we must be governed by circumstances; the first thing is, you must be comfortably warm during sleep, otherwise you are not refreshed, and inflammation of the lungs may be produced, and life destroyed within a few days. An open door and an open fire-place are sufficient for ordinary purposes in cold weather.

When outer windows are opened, it is well to have them down at the top two or three inches and up at the bottom for the same space. In miasmatic locations—and those are along water courses, beside mill-ponds, marshes, bayous, river bottoms, flat lands, and the like—it is important, from the first of August until several severe frosts have been noticed, to sleep with all external doors and windows closed, because the cool air of sunset causes the condensation of the emanations which were caused by the heat of the noon day sun to rise far above the earth; this condensation makes the air "heavy" at sundown, made heavy by the greater solidification of the emanations by cold; and resting on the surface of the earth in their more concentrated and malignant form, they are breathed into the lungs, and swallowed into the stomach, corrupting and poisoning the blood with great rapidity.

By daylight these condensations are made so compact by the protracted coolness of the night, that they are too near the surface of the earth to be breathed into the system; but as the sun begins to ascend, these heavy condensations, miasmas, begin to rise again to the hight of several feet above the ground, and are freely taken into the system by every breath and swallow; hence the hours of sunrise and sunset are the most unhealthful of the twenty-four in the localities named; and noontide, when the sun is hottest, is the most healthy portion of the day, because the miasma is so much rarefied that it ascends rapidly to the upper regions.

The general lessons are, 1st. Avoid exposure to the out-door air in miasmatic localities for the hours including sunrise and sunset. 2d. Have a blazing fire on the hearth of the family room at those hours, to rarify and send the miasma upwards. 3d. Take breakfast before going out of doors in the morning, and take tea before sundown; then being out after night is not injurious.

Exposed Arms.—A very distinguished Paris physician says: "I believe that, during the twenty years that I have practiced my profession, twenty thousand children have been carried to the cemeteries, a sacrifice to the absurd custom of exposing their arms. Put the bulb of a thermometer into a baby's mouth and the mercury rises to ninety degrees. Now carry the same to its little hand; if the arm be bare and even cool, the mercury will sink to fifty degrees. Of course, all the blood that flows through these arms must fall from ten to forty degrees below the temperature of the heart. Need I say, when these currents of the blood flow back to the chest, the child's vitality must be more are less compromised? And need I add that we ought not to be surprised at the frequent recurring affections of the tongue, throat, or stomach? I have seen more than one child, with habitual cough or hoarseness, entirely relieved by simply keeping the hands and arms warm."

Antidotes for Poison.—Commercial oil of turpentine is a good antidote to poisoning by phosphorus. The two substances form a compound in the stomach resembling spermaceti, and this can readily be removed from the system.

Laudanum or other anodyne is sometimes taken by mistake or otherwise in excess. Swallow strong coffee or the whites of several eggs instantly; all these things are to be done while the doctor is coming. Let every family remember that sweet oil, the whites of eggs and strong coffee antagonize a larger number of poisons than perhaps all other things together.

If laudanum, or any other poison not burning the throat, is taken and is promptly discovered, the best plan is to get it out of the stomach instantly, which is done by stirring a tablespoonful of ground mustard in a tumbler of water, and drinking it down at once; almost before it is down the whole contents of the stomach begin to be ejected.

Vegetable Spores in the Blood.—Prof. Richardson, of Philadelphia, several years ago, in the course of his experiments to determine whether bacteria (vegetable spores) pass from the stomach into the blood, swallowed 4 ounces of water which contained, according to his estimate, 27,000,000,000 of these minute organisms. In half an hour he discovered them in abundance in a drop of blood taken from the end of his finger. To swallow at a single gulp twenty times as many vegetable spores as there are human inhabitants on the earth, is but a small exploit for a modern scientist.

How to Prevent Spring Diseases.

From Dr. Hall's new work, "Health by Good Living," we extract the following valuable hint: It is an indisputable, physiological truth that if the instincts of nature were yielded to in the spring; were cherished in her desire to take less and less food as the weather grows warmer, as they are yielded in the autumn in taking more, a very large amount of the disease of spring and summer would be avoided. The great practical lesson to be learned in reference to the subject, a question of health and disease, yes, in multitudes of cases, a question of life and death, simply this: As the winter passes, and the balmy spring time comes on, do nothing to increase the appetite; eat no more than is called for; do not be uneasy because you have little or no relish for your food; eat less and less every day. The very best way to increase your pleasure of eating is to change the quality of food; use articles less carbonaceous, less warming; send from your table the pork and bacon, and fat meats, oils, and sugars, starches and sago, and the tapioca pudding, and the dumpling, and the rich pastries; get hold of the early "greens," the spinach, the salads, the turnip-top, the radish, the early berry and the daily fruit, and lean meats; pay increasing attention to the cleanliness of the skin; be more in the air; sleep in better ventilated rooms; let your windows be raised high at night, your inner door be left wide open.

Summer Clothing.—For all persons, especially invalids, and those who take cold easily, a thin material of woolen gauze next to the skin is safest and best, because—

First, it is a non-conductor, carries heat from the body more slowly than cotton, linen or silk; all colds are caused by the body becoming colder than natural, especially if it is made colder rapidly, and woolen material next the skin is the best thing known to prevent this rapid cooling, especially after exercise which has caused perspiration, and does not cause that disagreeable nephritis dampness which wet linen does when it comes in contact with the skin.

The warmer the weather the more need for woolen next the skin; hence British sailors are required to wear woolen next their skin in tropical latitudes, in summer, as the best observed precaution against disease.

All garments worn next to the skin during the day should be removed at night and spread out for thorough airing and drying.

Cotton is the best material to be worn next the skin at night. All changes from a heavier to a lighter clothing in summer, should be made by putting on the lighter clothing at the first dressing in the morning.

It is greatly safer for children, for invalids, and for old persons, to have too much clothing than too little.

Fat People.—Not long ago, a gentleman of threescore, who had scarcely ever been sick in his life, thought he was too fleshy and began to Bantamize. He succeeded famously, and boasted to his friends that he had got rid of ten pounds in a few weeks. A little later he was attacked with a painful and dangerous malady, from which he has been suffering more than a year.

If a man can sleep soundly, has a good appetite, with no unpleasant reminders after meals, the bodily habits being regular every day, he had better leave himself alone, whether he is big as a hogshead or as thin and dry as a fence rail.

Several cases of Bright's disease have been reported by medical men of reputation as a direct result of practicing Bantam's plan for getting lean. The very best and safest way to get rid of fat is to work it off. This may be aided by eating food which contains a large amount of nitrogen and a small amount of carbon.

Nitrogen food is that which gives strength, power to work, as lean meats; carbonaceous foods are those which make fat, such as cheese, potatoes, rice, corn, peas, beans, tapioca, arrowroot, cornstarch, milk, sugar, syrup, and all oily and fat food. Raw fruit and berries largely eaten are great aids to reducing weight.

But, after all, the great reliance should be on exercise and work in the open air. Barclay, the great English pedestrian, who performed greater feats than Weston, lost ten pounds in two or three days' walking, and was never the worse for it.—*Hall's Journal of Health.*

New Preservative Fluid.—The following are the ingredients of a liquid by means of which the organs of the body that have become absolutely offensive, from decay, may be treated so that they can be examined for marks of injury or signs of disease. The fluid consists of a mixture of iodine one drachm, methylated ether (of specific gravity .720) ten fluid ounces, absolute alcohol one fluid ounce, and strong sulphuric acid four fluid drachms. The action of the solution seems to be that the iodine deodorizes, while the sulphuric acid engages the water and the alkaline products of decomposition and produces the necessary firmness of structure. The other escapes, being simply the fluid dissolvent for the other agents.

Liebig on Alcohol.—As Professor Liebig is so often quoted in this connection in favor of drinking alcoholic beverages, we will close by by adding a quotation from the same great chemist. Says he: "Of spirits, he who drinks them draws a bill on his health which must always be renewed, because, for want of means, he cannot take it up. He consumes his capital instead of his interest, and the result is the bankruptcy of the body.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

Saturday Morning, April 27, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, April 24, 1872.—Legal Tenders buying, 89⅜; selling, 90⅜. Gold in New York to-day, 111⅞.

Table of Contents.

EDITORIALS.—Sargent's Mineral Land Bill, 257. Our Home Industries; Our National Park. 264. Lake Superior Gold Discoveries; Mining Stocks, 265. An Invention Wanted; Mining Sales, 268.

ILLUSTRATIOS.—Boone's Patent Railroad Tie, 257. Glass Bearings; Hendy's Improved Concentrator, 265.

MECHANICAL PROGRESS.—The Physical Properties of Steel; New Stuffing for Cushions; Band Saws for Cutting Large Timber; Wrought Iron Ties, 259.

SCIENTIFIC PROGRESS.—Atmospheric Influences on Lunacy; Piano Playing; The Principle of the Least Action in Nature; Moses, and Modern Science; Varieties of Colors, 259.

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 260-1.

USEFUL INFORMATION.—How to Varnish in Cold Weather; Insect Wonders; Transmission of Sound; Oil among the Ancients; Chemical Changes; Willow Wood, 263.

GOOD HEALTH.—Open Windows at Night; Exposed Arms; Antidotes for Poison; How to Prevent Spring Diseases; Summer Clothing; Fat People; New Preservative Fluid, 263.

DOMESTIC ECONOMY.—Good Bread and How to Make It; Economical Cooking in Oregon; Pickled Eggs; Hang up Pictures; Our Beds; Poached Eggs; Wafer Gingerbread, 266.

MISCELLANEOUS.—The Big Mill of Nevada; Water Rights; The Use of Earthquakes; A New Ditch Enterprise, 262. Black Diamond Coal Fields; Borax; A Strong Nation; School Lands, 258.

THE PRECIOUS METALS IN ALASKA.—The steamer Gussie Tolfair recently brought intelligence of the discovery of both gold and silver in Alaska, but nothing very definite is given. The climate and geographical position of our newly-acquired territority is unfavorable for prospecting parties from here, and it is not likely that any one will think of starting until more authentic reports are received. A sore temptation this will be, however, to many, for the mines are so far away, that they ought to be rich if they are not. If further proofs are given of the existence of the precious metals in any quantity in Alaska, some enterprising steamboat man will doubtless put on a line of "cheap" steamers for the benefit of would-be millionaires.

PLACER DISCOVERIES.—Placer mines have been discovered near Richmond, about three miles west of Susanville, in Nevada. The Nevada *State Journal* says that the first discovery was made in a cañon about one half mile east of Richmond, in a gravel deposit containing coarse washed gold, where they are now rocking out from $3 to $5 per day to the hand. Further up the same cañon richer placers have been found, which, according to the same paper, pay about $25 per day with sluices. A rich quartz ledge has been found in the same vicinity. The discoverers have for some time kept "shady" about their strike, but it has come out, and it is said the mines give evidence of permanence.

New placers are also reported in about 200 miles above Hardyville on the Colorado river. The miners are said to be making $5 per day.

THE BOARD of State Harbor Commissioners have reduced the rates of dockage, tolls, wharfage, etc., for the city of San Francisco, one half, and have adopted new rules and regulations concerning wharves and docks.

THERE is said to be great activity in mining matters in Schell Creek district, Nevada.

Our Home Industries.

The Foundries.

Business at the foundries is more brisk than it has been for the past two years. They have all got as much work as they can do, and the long prevailing dull times are at last over. Large and heavy orders do not seem to be very plenty, but the amount of work on hand is satisfactory and all are doing well. The scarcity of iron affects the trade considerably, for purchasers of course have to pay a proportionately higher price to have their orders filled. In the matter of mining machinery especially this scarcity exerts an important influence. Miners generally calculate on building a 5-stamp mill for so much, and a 10-stamp for so much, taking other mills as a precedent, and when they come to find an advance of about $35 per ton over last year on 100 or 150 tons of machinery, it makes quite a serious difference in their calculations, and hinders developments. Some of the reasons for this scarcity of iron were given in the last issue of the SCIENTIFIC PRESS and it is asserted that the probable supply of the coming two years is already engaged and there is no surplus stock on hand in the great iron markets of the world.

A great scarcity of first-class mechanics is reported by the foundrymen and there is no need of any of them being idle for they can obtain employment readily at good wages. The majority of the mechanics seem to be foreigners and in one establishment out of 54 in the machine and blacksmith shops alone 40 were foreigners and 14 natives, the latter including the boys who are nearly all natives. The laborers are as a general thing all foreigners. Engineers were also foreigners as were the majority of those in the moulding room. In the boiler shops 90 per cent. were foreigners. Taking this one foundry as a criterion it may be assumed that a large majority of the men employed were born under a foreign flag. The English mechanics are now having fine times working only 51 hours a week and at good wages, machinists getting £2 per week; no inducement for them to leave home. The bad times in this city for the past two years has compelled those who were here to leave and the railroads building throughout the Coast have absorbed quite a number causing a scarcity here with no fresh supply. The wages for good mechanics in this city are from $3.50 to $4 per pay according to their capacity.

The Pacific Iron Works.

Corner of First and Fremont streets, have just completed the machinery for a propeller freight boat for Owen's Lake. The boat is intended to carry wood, merchandise, etc., to supply the Cerro Gordo District. They are making a 10-stamp mill and mining machinery for the Silver Peak mine in Pioche District, Nevada, and carrying on extensive repairs to the lighthouse steamer Fern. They are turning out a lot of vacuum pans and sugar-house machinery for the California sugar refinery and are also furnishing some smelting works machinery for the Canton Mining Co. at Mineral Hill, Nevada, turning out the usual amount of small work.

The Miners Foundry,

First street, between Howard and Folsom, (Co-operative), are making an engine and boiler and hoisting works machinery to go to Ely District, Nevada, and have just shipped one of Paul's Electro-chemical dry amalgamating mills to Calaveras county. They are making the machinery for Boschke's tule-ditching machine and a large, heavy punch for the Pacific Rolling mills. Some hydraulic mining machinery is being turned out to go to Stanislaus county; just shipped a pony-gang sawmill up the Coast. The Saratoga paper mills, in Santa Clara county, have had some paper mill machinery made here which has just been shipped. A new pump, called the Goodwin pump, of which Mr. S. A. West is the inventor, is being made at this foundry. They are doing a variety of small jobs. At the

Fulton Foundry,

Corner of Tehama and Fremont streets, they are building two engines, 16 inch bore, 5 feet stroke, for the Colorado Steam Navigation Co., and an engine 8x16 feet with shafting and machinery for a tannery to go to Japan. They are making an engine 12x24, and boiler 48x16, with a 10-inch plunger pump, 6-foot stroke and a set of hoisting works for the Yuba Gravel Mining Co., at North Bloomfield. Are getting up two of Hoskin's Little Giant hydraulic nozzles, to throw respectively 8 and 9 inch streams. Also some large logging cars for Towle Bros. at Dutch Flat, and some for Ellsworth & Co. Making silver amalgam retorts for the Estaca mine in Mexico and doing considerable jobbing and repairing work.

The Risdon Iron and Locomotive Works,

Corner of Howard and Beale streets, have been doing a good deal of engine work of late and have built a number of large engines. At work on machinery for a large ice manufacturing establishment in this city and on a surface condenser for S. L. Mastick, supposed to be the first regular surface condenser ever made here. An engine, 20-inch cylinder and hoisting gear is being made for the Belcher mine, and two 18-inch engines for the Crown Point mine. A large contract has just been finished for the Pacific Mail Co., consisting of overhead railways and steam hoists for coaling vessels, which will be in operation in a week or so. They are making 50 iron cars for the California Sugar Refinery, to run by hand on a planked way. Business with them as with others is brisk and a good deal of small work is being done.

Golden State Iron Works,

No. 19 First street, are making furnace irons for Eureka, Nev., water pipe for the North Star mine, Nevada Co., and doing some iron work for the Oakland Paving Company. Windmill irons are being made for Suisun and a large amount of angle blocks and washers for the Pacific Bridge Co. They are turning out a 10-stamp mill for the Talc Mining Co., at Quincy, Plumas Co., and Stevenson pans for the Boston mill at Gold Hill; also a battery and Stevenson pans and settlers for the Belmont Mining Co., at Havilah, Kern County; making stamp shoes and dies for different parts of the country, and doing considerable small work. At the

Aetna Iron Works,

Corner of Fremont and Tehama streets, they are building house fronts for Petaluma and Oakland and have just cast a 7,000-lb. propellor for steamer Idaho; and a 10,000-lb. one for the Ajax. Making propellor shafting, etc., for a steamboat for Renton Smith & Co., and shafting, machinery, etc., for pulverizing mill. Have just completed two of White's Rotary Furnaces for the Lemon Mill and Mining Co.; building mixers, pumps, pump-valves and some other machinery for Bay Sugar Refinery, and repairing a lot of old machinery for Flint, Peabody & Co.'s stave factory; doing considerable small work.

The San Francisco Boiler Works,

Nos. 123 and 125 Beale street, are at work on a boiler 83x17-9 for steamer Cyrus Walker, and one 66x16 for the Portland Water Co., Oregon. Two boilers are being built, 42x12, for the Meadow Valley Mining Co., and a 42 inch boiler for Ohlandt & Co.'s bone factory. Have just finished a boiler 42x14 for N. B. Hick's sawmill in Santa Cruz, and a large tank 44 feet long, 20 wide and 8 deep, for a reservoir for the Stockton water works. Making a locomotive-shaped boiler 17 feet by 6 in diameter for the Colorado Steam Navigation Co., and a 54x16 boiler for the Silver Peak mine at Pioche. Making buckets for a dredging machine for the Miners' Foundry, and curbs for settlers, and Hepburn pans for latter named mine. Have all the work they can do.

The Union Iron Works,

Corner of First and Mission streets, are running a full force on full time, and doing more than the usual amount of business. They, like the rest, complain of a scarcity of good mechanics. Times is lively with them and likely to continue so for some time to come.

Pracy's Machine Works,

109 and 111 Mission street, present the neatest appearance of any shop in the city; though small the works have a fine assortment of tools, and are able to turn out any kind of work required. Just now they are making horse-power machinery, wood-turners' lathes, etc. The proprietor makes a specialty of grist-mills, and is at work on quite a number of them at present. The establishment is very neat and complete.

Our National Park.

We have received a number of maps and documents in relation to the Great National Park in the Yellowstone Reservation in Montana and Wyoming Territories. The land reserved lies near the head waters of the Yellowstone river, commencing at the junction of Gardiner's river and the Yellowstone, and running east to the meridian passing ten miles to the eastward of the most easterly point of Yellowstone Lake; thence south along that meridian to the parallel of latitude passing ten miles south of the most southern point of Yellowstone Lake; thence west along that parallel to the meridian passing fifteen miles west of the most western point of Madison Lake; thence north along the meridian to the latitude of the junction of the Yellowstone and Gardiner's rivers; and thence east to the place of beginning.

This area of land has been reserved and withdrawn from settlement or sale, and set apart as a public park or pleasure ground, for the benefit of the people of the United States. It is to be under the control of the Secretary of the Interior, who is to make such rules and regulations as he may think proper for its care and management. All timbers, mineral deposits, natural curiosities or wonders are to be preserved in their natural condition, and remain undisturbed. The Secretary may, if he sees fit, grant leases for building purposes, for terms not to exceed ten years, of small parcels of land, at such places as may require houses for the accommodation of visitors. All the revenue from this source is to be expended in building roads, bridle-paths, etc., in the park. The Secretary is to provide against wanton destruction of game and fish in the reservation, and against their capture for the purpose of profit.

The land is, as a general thing, not susceptable of cultivation, and the entire area within the limits of the reservation is over 6,000 feet above sea level. The Yellowstone Lake, which occupies an area 15 by 22 miles, or 330 square miles, is 7,427 feet. The range of mountains that hem the valleys in rise to a hight of from 10,000 to 12,000 feet, and are covered with snow all the year round. These mountains are all of volcanic origin, and it is not probable that any mines will ever be discovered there. During the months of June, July and August the climate is most invigorating, with scarcely any rain or storms of any kind. There is frost every month of the year. This whole region was, in comparatively recent time, the scene of the most wonderful volcanic activity of any portion of our country. We have given, at different times, detailed descriptions of some of the wonders of this region, which will in a few years be a place of resort for all classes of people from all parts of the world.

The project of establishing a Grand National Park in such a locality is worthy of the age and the nation which has originated the idea. It will become, in future ages, a place for the world's resort, where the grandeurs of nature and all her wonderful displays of power and energy, as put forth in the tempest, the earthquake and the volcano may be seen, studied and admired in the great laboratory within which the fires have been, as it were, but just extinguished.

Mining Stocks.

The question of the day in San Francisco is, "How are Stocks?" and the vernacular of the Stock Exchange is as familiar as household words. The excitement in mining stocks for the past few weeks has surpassed all former ones, and everybody is buying who has any money to buy with. The names of a few are mentioned who have made fortunes in the sudden rise in value of their stock, but of the unfortunate we hear nothing, in fact their turn has not come yet but everybody expects it will. Till the fall comes, people will continue to speculate wildly and take their chances. The present excitement is, however, no mere stock bubble, but is founded upon *bona fide* developments in the deepest levels of the Comstock mines. Some descriptions there are, of course, which are inflated above their real value, by reason of the rise in others, while on the other hand, some are not as high as their merits deserve.

Money is plenty and mining investments take precedence at present, and with a good reason. The immense actual values of some of the Comstock mines seem almost fabulous, but they are founded upon the amount of ore in sight in the ore bodies in the deep levels such as have never before been developed. Cool, business men are purchasing the stock of those mines for the legitimate purpose of drawing dividends from them as an investment which will pay them a higher percentage on the capital invested than any other enterprise. No such bodies of gold and silver bearing ore have ever been found before, in any part of the world, and the consequent large increase in value of the mines in which they are situated is not therefore to be wondered at. The developments in the Crown Point and Belcher have given a new basis in value to all the mines on the lode, and the Savage, Hale & Norcross, Chollar and others are expected to come in for their share of the ore as soon as they shall have been sufficiently explored. The ore that has been discovered during the past year in the Comstock lode will probably exceed in amount, all that has heretofore been taken from it, and the value of the mines embraced within the area, on the surface, of a quarter of a mile in width by two and a half miles in length, can scarcely be calculated.

The effect that these wonderful developments have exerted upon the mining interests of this Coast is very gratifying. Mines in all quarters will now have the benefit of capital, for capitalists who have been wont to look upon mining as a rather hap-hazard kind of business will view it in a better light. Foreigners particularly will be enlightened as to the richness of our mines and be more likely to invest here than heretofore.

We hear of bright prospects all over the Coast, and mining matters and our bullion yield will doubtless be greater this year than ever before. The following table will show the number of feet and shares in the principal mines dealt in at the San Francisco Stock and exchange Board which will be of interest just now. By reference to another column the prices of today may be seen:

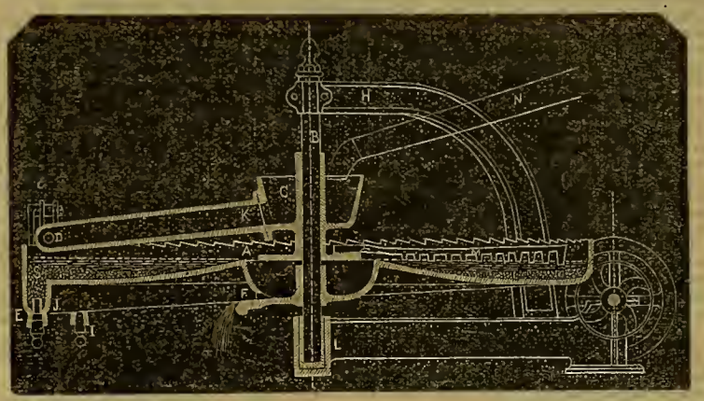
Hendy's Improved Concentrator.

Gold and silver gleaners are becoming in more active demand, a fact which shows an increased disposition among miners to work their ores more closely and with the greatest possible economy. Various devices and modifications have been invented and tested, for saving sulphurets, and fine gold, with results more or less



HENDY'S IMPROVED CONCENTRAOR.

favorable, and nearly every one of which has furnished cumulative evidence that our workings heretofore have been wasteful in the extreme. The wonder is that this fact has not been sooner recognized and supplemented with a more general introduction of improved saving appliances.

We are led to these remarks at this time, more particularly from hearing that there has lately been an increased demand for Hendy's ore concentrators. Among other recent orders we hear of six for the St. Patrick mill, near Newcastle; six for the Julian mill, same place; two for the Keystone, Amador County; four for the St. Lawrence Mill, Georgetown, El Dorado county, and one for the Virtue mine, Oregon.

These machines have been well tested, and are fast gaining in favor among our miners generally—over 400 having been already put in use, some of which have been in constant operation for upwards of four years. Their construction has been improved from time to time, as experience and observation has warranted. So great has become the demand for them that Mr. Hendy has recently established machine works at 32 Fremont street, in this city, in large part for their especial manufacture, whereby all the work upon them will be done under his personal supervision, and in the most thorough manner.

We have before described the main features of this patented invention, but will for the benefit of many new readers give a short description of its operation. The sulphurets and water are received through the spout, *N*, into the bowl, *C*, and distributed through the pipe, *K*, this pipe is rotated by means of a pawl and the notched rim of the concentrator as the body of the concentrator oscillates backward and forward. The sulphurets being heavier are worked into the annular pocket, *S*, and drawn off from the hole, *E*. The water, sand and lighter particles are discharged at the centre, *A*. This machine is somewhat of an improvement on that which has heretofore been illustrated in our columns.

In Henry county, Kentucky, a report of silver ore is said to have been recently discovered, which yields 54 per cent. of silver.

A Pittsburg firm have recently shipped two steam pumps to New Castle, England.

More About Glass Bearings.

Since our reference, last week, to the introduction of glass bearings, at the East, we have received a call from Mr. D. Brannan, proprietor of the Pottery Works at Brooklyn, Alameda county, who informs us that he has been appointed general agent for the sale and manufacture of these bearings in California, and that he is prepared to furnish circulars, give any required information with regard to them, and to exhibit specimens of the manner in which they are prepared, to any person desirous of more particular information with regard to them. The inventor of the device is Mr. John Harden, 48 Broad street, N. Y., by whom it was patented Jan. 14, 1868. The bearings have already been extensively introduced for locomotives and other machinery, as we learn from a large number of names of railway superintendents and master mechanics to whom the inventor is allowed to refer.

From a circular which has been placed in our hands by Mr. Brannan, the California Agent, we learn that the bearings have been in constant use, in the Atlantic States, on a great number of engines—locomotive, stationary and marine—for over three years, and that they have given very general satisfaction.

It is well known that the harder and smoother the material which is used for bearings the less will be the friction. Now glass is very hard and extremely smooth, and by the device employed by Mr. Harden for introducing it into bearing surfaces, it is manifestly very secure from breakage and capable of sustaining any

weight required for bearings in every class of machinery. Moreover glass is a non-conductor of heat and electricity, and is uniform in hardness, unlike any metallic bearing and being neither porous nor fibrous it does not use up oil as fast as ordinary bearings. Various parties who have used these bearings assure the inventor that they do not use more than one-half, and in some instances not more than one-quarter the oil required by metallic bearings—a matter of no small consideration in running machinery.

The small engraving herewith presented, if examined in connection with the description we gave last week will give a very intelligible idea of the manner in which the glass is employed in the bearings. The light round spots in the figure represent cylinders of glass firmly imbedded within the metal, which constitute the chief part of the bearing. The glass is set even with the metal, but as the latter yields to attrition, the glass soon becomes the actual bearing surface and takes the entire weight imposed. It is said that glass which has been so used for several years shows no signs of wear, while the journal or guide resting upon the glass assumes as smooth and bright a surface as the glass itself, and with as little wear.

Of course friction must thereby be greatly reduced, with a corresponding decrease in the power required, while the machinery itself is longer lived. The glass can be moulded to any required form or surface—plane, convex or concave—and there are few working parts of machinery where it is inapplicable. We understand that it has been successfully used in packing rings, on an engine making 150 revolutions a minute, as severe a test, perhaps, as would probably be required in any ordinary use. The cost is very reasonable, as we are assured that 50 pieces of glass can be inserted for a locomotive for only about $25.

A New Mining Enterprise.—As we remarked last week, unusual attention is being turned to the working of the auriferous sands of our sea coast, and a large company is now going to Gold Bluff, Klamath county, to start a somewhat novel enterprise. The Pacific Submarine Exploring Company, of New York, propose to get at the sand by means of a diving bell. The gold can only be reached at low water, and the time is so short that the miners find trouble in making it pay to work their claims. Then the wet sand has to be carted over the sandy roads for some distance, causing more loss of time. It has been found that the sands grow richer the further they could penetrate into the breakers, and soundings in six and ten fathoms of water revealed the fact that they were yet richer in remarkably pure gold. It seems as if the gold were washed up from the submarine banks.

Parties who have been using the diving bell in removing the rocks at Hell Gate, in New York Harbor, have gone into this enterprise with considerable zeal, and hope to make a success of it. A large bell is now being made in this city. It is divided into chambers, in one of which air condensed to three atmospheres is to be stored for the use of the operators. A schooner will be provided with a steam vacuum pump, and elastic rubber tubing, by means of which, when a rich deposit is found, the sand is to be elevated on board. It is estimated that 100 tons per hour can be raised by this means. The sands will flow upwards in a steady stream, carrying water enough to give them mobility. This is placed in lighters and carried ashore for chlorination. The state of the ocean in the locality mentioned, will permit the work to last from the 1st of May to September, and after that date the company sails with its appointments to the pearl fishery of the Gulf of California. We shall look with interest to the results accomplished by the company, and think that their enterprise warrants success.

Utah Mines.—Wagon communication with the mines in Little Cottonwood Cañon is open and the mines are once more accessible. Immense quantities of ore, that have been accumulating on the dumps since the road was blocked up, are now being brought to Salt Lake City. Most of the other districts that were troubled with "snow blockades" are now free, and the snow though deep is melting fast. General news from the mines is favorable and a number of rich strikes are reported. The tunnel enterprises are proving successful in Little Cottonwood and a large amount of capital is said to be engaged for the erection of mills and furnaces the coming season. Experts and capitalists are plenty at Salt Lake, a pretty sure indication as to the estimation in which the mines are held by non-residents.

Earthquakes Underground.—It is worthy of note that, although the miners at work underground at Cerro Gordo during the recent severe earthquakes, did not feel the shocks, that a late earthquake in Germany is said to have been felt with great force underground, and the miners hurried out with all possible haste.

The amount of bullion shipped for the first 19 days in april, through Wells, Fargo & Co's office at Reno, was 43,894 pounds.

Domestic Economy.

Good Bread and How to Make It.

Holy Writ assures us that bread ie the staff of life; and our daily experience fully proves the truth of the assertion. But it is not enough to procure this staff of life in sufficient quantity; the excelleuce of its quality is also of great importance. The strong, healthy man may perhaps eat poor bread without experiencing any inconvenience; but the delicate child or invalid, whose impaired digestion requires great carefulness in diet, cannot pay too much attention to the quality; bread is indeed to them the staff of life. The superior nutritious properties of bread have been disputed, but the douht has been dispelled by some chemical researches made iu France testing the comparative nutriment of various edibles.

The word bread is derived from brayed grain, from the verb to hray or pound; indicative of the old method of preparing the flour. Dough comes from the Anglo-Saxon word *deavian* to wet, to moisten. Loaf is from the Anglo-Saxon *lif-ian*, to raiso, to lift up, as raised bread. Leaven is derived from the Freuch verh *levee*, to raise, as the Saxon word *lif-ian*.

The superiority of good home-made bread has long heen acknowledged, yet how few families really make good bread. All bakers use alum, which is injurious to the health, and causes indigestion iu delicate persons. But the alum benefits the haker in several ways; it causes his loaves to separate evenly and without trouble, and increases the weight of the loaf, as it makes the flour absorb more water; therefore, a four-pound loaf of baker's hread will contain less nourishment than a loaf of home-made bread of equal weight.

Ecouomy should make every woman her own bread-maker. The alum also imparts a better color to the flour, aud conceals any unpleasant odor arising from damaged flour. Baker's hread dries much quicker than home-made. The reason is, that alum is what chemists call and efflorescent salt, that is, it dries by exposure to the air; common salt is delinquescent, that is, it attracts moisture from the air; therefore, bread which contains salt only, will keep moist much longer than that which coutains alum. These are certainly reasons why every woman should make her own bread, or have it made in her kitchen.

How to Make Good Bread.

We propose to give a few receipts for bread making which will not fail. First we will give a receipt for making yeast. The yeast bought at the door is not always of good quality. The recipe for hop yeast given has been tested for twenty years, and rarely fails; never, if the yeast jug is perfectly sweet and the yeast properly made: Boil in a porcelain or copper-tinned kettle, two large handfuls of hops, tied in a cloth, six large potatoes sliced thin, in six qnarts of water. When the potatoes are very soft skim them out, and either rub through a colander or mash fine on a plate. Take ont the hops; squeeze dry, and hang away for another time, as they can be used twice. Keep the watar boiling, mix one and one-half pints of wheat flower to a smooth batter with cold water, and one tablespoonful of vinegar, two of brown sugar, and one teaspoonful of salt; mix in the mashed potatoes, stir all into the hoiling water, aud boil ten minutes. Turn into a six-quart tin pau. When milk-warm to the touch add ono teacup of yeast. Let it rise over night, then put into a stone jug.

This yeast will keep in a cellar, perfectly good for six weeks. A large teacup full will make two large loaves of hread. Be sure to reserve a teacnpful to rise the yeast with the next time. Always scald the jug thoroughly and keep water in it over night, with a tablespoonful of saleratus stirred into it. This will sweeten the jug. It takes a larger quantity of this yoast to rise hread, biscuit, or muffins than of distillery yeast, hut the effect is quite as good.

To make hread of first-rate quality, the sponge should be made over night. Bread that has been raised three times is mnch the best. It is of a firm, even texture, has no fiesures or oracks, and the slice presents an even surface. Here is a recipe that rarely fails: Take one quart of new milk, and add boiling water sufficient to make it warm to the touch. (Water can he euhstituted for the milk, but bread made without milk dries more rapidly.) Add one teaspoonful of salt, stir in three quarts of flour and one tea-cup of home-made yeaet, or three tablespoonfule of dietillery yeast. Mix well together, then sprinkle flour all around the edgee of the batter or sponge, leaving a small spacc in the middle uncovered. Set in a warm place to rise, covering with a pan. In summer the sponge will he ready to mold over before breakfast. Mix it up thick so that it can ho kneaded well, and knead it half an hour or more. Chopping it with a chopping knife adds to its lightness and poroeity. When well kneaded, sprinkle flour on the bottom of the pan thickly, put in the dough, and set it away for half an hour or more, but watch it closely. (Bread making should he most carefully tended, as any neglect ruine the whole. If allowod to rise too much its sweetuess is gone, and though saleratus will take away the acidity, its aroma and flavor are destroyed.) When light enough turn out on the molding-hoard and knead thoroughly; divide into two loaves, reserving a portiou for hiscuit, so that the new-made loaves may not be ent that day. Mold well, put into the pans, let it rise iu a warm place fifteen minutes, then hake in a hot oven. If the oven be hot, the bread will lose less weight in haking than when the oven is slack. The batter can he haked in the morning in muffin rings, and makes delicious hreakfast cakes, hetter than hot biscuit.

Bread made with potatoes is very nice: Boil three large potatoes, well pared, or six good sized ones; rub them through a colander into your bread pan. Rinse them through the colander with a pint of hoiling water; add one quart of milk. Stir in half a pint of flour, and when the liquor is cool enough add a teacup of home-made yeast; set it in a warm place. If thie is done after dinner—using the potatoes left from the table—the sponge will he ready for moro flour hy eight or nine o'clock in the evening. Now mix to a stiff batter, sprinkle flour over it, set to rise. In the morning knead into a stiff dough, let it rise well, then knead again, put into pans, let it rise fifteen or twenty miunutes, and hake in a hot oven.

All bread, biscuit or doughnuts raised with yeast should rise after bcing kneaded hefore they are baked. If put in the oven or fried directly they are never light. The dough has had no opportunity to recover its elasticity, and cannot he as good. Common sized loaves of bread will hako in three-quarters of an hour, provided the oven is of proper heat.

Palatahle as good wheat bread is, there is no doubt that eating it entirely is not conducive to health. Rye, Indian meal and coarse flour make hread that is better adapted to the development of the muscles. Boston hrown bread is much used, and is far better for young children than hread made of superfine flour. It is easily made: Take two qnarts of Indian meal, sifted, one quart of rye meal or Graham flour, one large spoonful of salt, one teacup of molasses, one teacup of home-made yeast, or half the quantity of hrewers' yeast. Mix with hot water as stiff as one can stir it, let it rise oue hour, hake in deep earthen or iron pots, which are made purposely. To avoid the thick crust produced by haking so long, boil it four hours and bake one, removing the cover before setting it fiito the oven.

Good bread and hutter cannot be made without some experieuce and intelligence. Upon their quality depends half the comfort of the table, and yet full half the people in this country never taste them in perfection.—*Ex.*

Economical Cooking in Oregon.—There is a place in Oregon, says an exchange, called the Smoky Valley, where the people have a very curious way of cooking. They do not have the trouble of making a fire every morning when they wish to get hreakfast. They just walk out with their kettles, coffee-pots, and whatever else they need, and cook at the boiling spring. The water seems a great deal better than common hoiling water, and all they need to do is to have their kettles in it for a ehort time, and their food is nicely cooked. They are able even to bake in it. The bread is put into a tight saucepan and lowered into the boiling flood for an hour or two, and then drawn up most exquisitely baked, with but a thin rim on the crust over it. Meat is cooked here, and heans, which are the miner's great luxury. It takes but a minute to cook eggs, or to make a pot of coffee or tea; hnt if there should chance to be a "slip hetweeu the cup aud the lip," the food would be gone heyond recovery.

Pickled Eogs.—At the season of the year when the stock of eggs is plentiful, cause some four or six dozen to he hoiled in a capacious saucepan until they become quite hard. Then, after removing the shells, lay them carefully in large monthed jars, and pour over them scalding vinegar well seasoned with whole pepper, allspice, a few races of ginger and a few cloves of garlic. When cold they are bunged down close, and in a month are fit for use. Where eggs are plentiful the above pickle is by no means expensive, and as an accompaniment to cold meat it cannot he outrivaled.

Ants and Moles.—For ants, place a fresh meat bone where the ants can get atit, and they will flock to it in large numbers. When they are on it, dip it in hot water; repeat it a few times and the ants will have disappeared. For moles, dig a hole like a post hole across one of the mole holes, and in the bottom, place some rags previously dipped in sulphur. Set fire to them, and, when once well on fire, cover up close with a board, and the mole hole acts as a pipe. The mole leaves.

Bohemian Cream.—Take four ounces of any fruit you choose, which has been stoued, soft and sweetened. Pass the fruit through a sieve, and add one and a half ounces of melted or disolved isinglass to a half-pint of fruit; mix it well together; then whip a pint of rich cream, and add the fruit and isinglase gradually to it. Then pour it all into a mould; set it on ice or in a cool place, and when hardened or set, dip the mould a moment in warm water, and turn it out ready for the table.

To Cook Cod Fish, says a writer in *Western Rural*, never freshen it, but pick it up fine and put it in a frying pan with a large piece of butter and one quart of milk. Let it come to a hoil, then pour in a teacup of cold milk with a tablespoon of flour stirred in it. Season with pepper to taste. The fish will salt it sufficiently.

To Brown Potatoes Under Meat.—Boil some fine, large, mealy potatoes; take off the skins carefully, and about an hour before the meat is cooked put them in the dripping pan, having well dredged them with flour. Before serving, drain them from any grease, and serve them up hot.

Hang up Pictures.

Any observing person will notice a great difference in people in the matter of furnishing or decorating their houses with pictures. Nothing adds more to the general appearance of a room than a tasty adornment of the walls with articles of this kind, whether they he photographs, chromos, engravings or oil paintings. And yet how often do we find parlors furnished with the costliest of carpets, curtains and furniture, where the walls are as bare as a side-walk, and and ahout as suggestive in all that pertains to matters of art and refined taste. There is evidence of wealth, hut at the same time au utter lack of that appreciation of the way in which it should he used that it may render the greatest amount of return in all that redounds to culture and esthetic taste. It reminds one of the harbaric splendor and show; of a wish to astonish rather than to charm; of great opportunities with feeble realizations of the fact. On the other hand, many a humhle home, never guilty of entertaining a Brussels carpet or a marble top table, has such an attractive look, as one opens the door, that it seems like seeing the face of an old friend, and almost wholly because it is so tastily furnished with pictures, in appropriate positions, well fitted to tho general size and hight of the room. There is a cosy air about the surroundings which makes one seem at home, and a different feeling is imparted from that felt where there is more wealth exhibited, but less culture.

There is no excnse for a lack of picturcs of some sort, for the cheapness of engravings and chromos place them within the reach of the poorest. It is not necessary that they should bo oil paintings, or in expensive framcs; even the cheaper chromos, or an engraving, or perchanco a delicately tinted water sketch or crayon, may be more appropriate as compared with the furniture than one more expensive. But in these days when tho engraver aud lithographer have scattered the choice productions of their handicraft so cheaply all over the country, there is hardly any reasou why even the humhlest home may not have a variety of attractivo pictures hung upon the walls to break the dull monotony of white plaster, or the stereotyped figures of paper hangings. And in tho more luxurious furnished parlors, there is no excuse for a lack of pictures, save a want of proper taste in the occupants, which may be, let us charitably hopo, more their misfortune than their fault.—*Cabinet Maker.*

Our Beds.—Cousidering that ahout a third of our lives is passed in our beds, they deserve much more attention than they get. France has long been in advance of the rest of the civilized world in this respect, having really paid as careful attention in excellence in this respect as to that in cookery. The grand secret of the superiority of French bedding is to be found not merely in the existence of good spriugs and well-filled mattresses, but in the fact that these mattresses are pulled and re-made annually. This is the reason why beds in other countries are generally such a mockery of the Freuch beds, which they are intended to imitate. French houses usually have a court-yard behind, in which carpets are beateu and various other domestic business is transacted, and here in fine weather may be seen the practice of mattress etuffing. An old mattress, on which heavy bodies have lain for a series of years, hecomes, no matter how well filled with horse hair, nearly as springy as street-car cushions. If you want a comfortable bed, here is the unfailing receipt: First, very good springs; secondly, a thick hair mattress over them; thirdly, a thick wool mattress over that. Both mattresses should be remade every two years.

Poached Eogs.—These are often brought to the table sloppy with water, the yolks salvy and broken, and the whole in a mussy state. The right way to do is to have the water in the flat-hottomed dish or spider, boiling, and then place it on the top of the stove where it will keep at that heat hut not boil a particle. Break the eggs one by one and turn them into the water carefully, so as to keep them in nice form, the water being about an inch or two deep. Let the eggs remain two minutes, then lift each one out on a small skimmer and place them neatly side hy side on a platter or on toast; and they will be handsome on the table, as well as taste deliciously.

Wafer Gingerbread.—Half a pound of flour, and half a pound of the coarsest brown sugar, quarter of a pound of hutter, one desertspoonful of allspice, two ditto of ground ginger, the peel of half a lemon grated, and the whole of the juice; mix all these ingredients together, adding ahout half a pound of treacle, so as to make a paste sufficiently thin to spread upon sheet tins; heat it well, hutter the tins, and spread very thinly over them; hake it in rather a slow oven, and watch it till done. Withdraw the tins, cut it in squares with a knife the usual size of wafer biscuits, and roll each around the fingers as it is raised from the tin.

The Bedding of the Dutch workingman, says the *English Mechanic*, iu an interesting article on Dutch industry, is made up of kapok, a silky fibre from the tree gourd of a tree known in the Indies. From the seed is obtained oil, and cattle are fed with the refuse. Neither moths or vermin will attack this material, and hence the Dutch are helped by Nature in keeping their households wholesome.

The Hesse Grinder and Amalgamator.

BEST IN USE!

Especially well adapted for the Reduction of Sulphuret Ores.

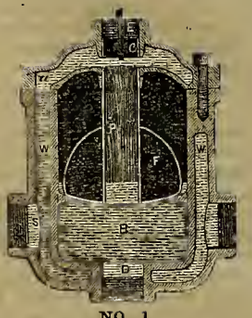
CRAIG & BREVOORT'S

Patent Condenser for Steam PUMPS, &c.



NO. 1.

The annoxed engravings represent a Condenser intended to he attached to the ordinary steam pump, therehy bringing it within the claas of low pressure, or more properly apeaking, of condensing engines; the steam, when it haa done its work in the cylinder, instead of hcing exhausted into the atmoephere, is conducted to the condenser, on its entry into which, it meets the watar drawn hy the pump, and ie immediately condensed.

The Cut No. 1 representa a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of aupply the pump may have; W is a water jacket surrounding the main chamber of the condenaer, B, and with which the suction pipe, S, communicatea, permitting a free circulation of water within the jacket and into the hollow cover or top through the aeries of openinge, one of which is ehown at A, and from thence into the body of Condenser, B, through pipe P, carried hy float F; the pipe P also acts autom.atically as a valve to enlarge or contract the apace through which the water enters it, hy which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will he observed, also acts as guide to float F.

The valve, O, (shown in Cut No. 1), which is raised or lowered hy means of screwed stem—shown coming through olhow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylindcr is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust aide of the steam pieton, aiding it in its work. If at any time it ie desirable to run the pump without the condenser, it is only neceasary to turn the three-way cock, which ia placed in the exhaust pipe into euch a position aa to eause the steam cylinder to exhanst into the atmosphere; when this ia done the pump ia perfectly free from the condenser, and acts aa if it were not attached. Thia condenser ie specially useful for pumps running in mines, or any other position where trouhle is experienced in getting rid of the exhaust steam. Addresa H. L. BREVOORT,

6v23eow1y 123 Broadway, New York City.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 16TH, 1872.

FRUIT DRIER.—George W. Stevens and John Oray, San Francisco, Cal., assignors to said Stevens.

LAMP BRACKET AND REFLECTOR.—Emil Boesch, S. F., Cal.

FORMING BLOCKS FOR PAVEMENTS.—George L. Eagan, S. F., Cal.

FARE BOX.—Carlton Newman, S. F., Cal., assignor to himself, George P. Kimball, and R. L. Ogden.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

An Invention Wanted.

A great deal of attention is being turned to the new African Diamond fields and numberless adventurers from all parts of the world are going there. We gave, in a recent issue a detailed description of the diamond fields, the proper route by which to go, expenses of living, transportation, etc., and now invite the attention of some genius to overcome a difficulty that exists there, in the matter of properly crushing the matrix of the diamond. The earth in which they are found, of which there are several specimens to be seen in this city, is a whitish cement like formation, which is easily redneed to a powder by a blow. It occurs in pockets of considerable superficial area which are scattered about at short distances apart all over the country. These deposits are enclosed in slaty rocks which sometimes "crop out."

The method of mining is by sinking a shaft as far as pay dirt is found, and some of the shafts have been sunk as deep as 70 feet. The cement is raised and carried to a sorting table where it is pulverized by hand, hy means of wooden mallets, care being taken not to injure the diamond in the operation. This pnlverized material is spread out and scanned carefully for the precious gems and the miner may consider himself fortunate if he finds one small one in a week. Sharp-sighted men have the best chance.

Now one of the inventions needed is a machine hy which this cement can he crushed to not less than one thirty-second of an inch in size, and that can he run by horso-power or hand. It must also effect the object desired without injury to the diamonds contained in the cemeut. The cement is a little more adhesive than dried mortar. The other invention wanted is a separating machine which shall require no water and at the same time he reliable. The river diggings have all been exhausted and the present fields are dry. Here is a chance for some of our California inventors to exercise their ingenuity and perpetuate their names. Who shall it he?

DEVIL'S INK.—We have received the following in a drop letter through the S. F. post office. It appears to be the handwriting of the eminent Boston scientist whose name is appended to it. The substance referred to, and of which the analysis is given, is what is popularly known as the "Devil's Ink," obtained at the Geysers near Calistoga, in Napa county:

One hundred grains of this ink yielded an analysis (per cent).

Water	84.3
Sulphuric acid and sulphur	1.3
Protosulphide of iron	2.8
Silica	10.3
Alumina	1.2
Soda, a little lime and loss	0.1
	100.0

The black color of this iuk is produced by precipitated protosulphide of iron, throwu down by an alkaline sulphide, probably of soda. C. T. JACKSON.

Boston, Fcb. 4th, 1872.

MINING intelligence from Trinity and Siskiyou counties is encouraging.

MINING SALES.—According to the Quincy *National*, it is again rumored that the Eureka mine has been sold to an English company for $1,000,000. The *National* puts little faith in the report, hut says that negotiations for some such trade are pending, and will probahly he perfected as soon as the title can he secured by patent.

The Conrad ditch property, at Jenny Lind, has been sold, it is said, to Craig & Co., of this city, and the ditch is to be enlarged to suit the increasing gravel mining interests of that locality.

The sum of $80,000 has been paid by Col. D. E. Buel, of Salt Lake, for a gold mine at San Gahriel, Lower California.

Jas. Southal has sold his interest in the Virginia mine, at Yankee Blade, for $2,000.

The Rattlesnake gulch claims have been sold to Richards, Yeates & Larison, and water will he put upon them from the Plumas ditch.

It is rumored that the Mammoth mine, at Jamison, has changed hands.

The Quincy *National* says that the Hungarian Hill claims aro ahout to be sold to capitalists in this city. No figures given.

PEACE RIVER MINES.—The Deer Lodge *Independent* has received a letter from a correspondent at Peace River in which he says that prospecting there is like looking for gold in the Arctic regions. The gold is scatered all over the country but thinly sown. Some few men are making money but the majority are not. The writer advises all who can make a living elsewhere not to go to Peace River. The old story of rash excitement on uo firm basis. Lots of gold till you get there and then it is "thinly sown." But prospecters will seldom listen to reason and advice but want to see for themselves; and they generally do see, often to their sorrow.

A CIRCULAR has been issued inviting subscriptions for 45,000 shares in the Great Western Telegraph Company, which proposes to lay telegraph cables direct from England to New York, and thence to the West Indies. Shares aro twenty pounds each. The total capital of the company is fixed at £1,350,000. The Messrs. Hooper will make and lay the cahles for £1,330,000.

THE contract for constructiug the Canadian North Shore Railroad has been awarded to Messrs. Dunlap, Smith & Keith, of Chicago, who competed with Canadian and English firms for the job. The road is to cost $7,000,000, and be completed in 1875.

CALIFORNIA MACHINERY FOR THE EAST.—Mr. J. Hendy, of this city, is now filling an order for one of his ore concentrators for a Cincinnati firm, to be used for concentratiug iron ore.

CAPTAIN HALL has been heard from. He was in Greeuland in the Polaris and all reported well.

MR. W. H. WEBB the eminent shipowuer and ship-builder is in town.

DURING the past ten years Montana mines produced over $120,000,000.

NEW AND VALUABLE BOOK ON MINING.—The "Explorers', Miners' and Metallurgists' Companion."—By J. S. Phillips, M. E., of SanFrancisco; Dewey & Co. This book has becu written especially for practical men, to supply a demand and meet their daily requirements for useful working purposes, in the exploration, mining and reduction operations of new countries; and for such men, it is by far the most comprehensive, preeminently practical and valuahlo work that we have seen. It is, however, just as useful to the mining capitalists as for those to whom it has been dedicated, for the author has so fully exposed the many errors of the past and present, (more especially those caused by the mere thereorist) with his fearless, practical pen, that consequent benent must result therefrom in the future mining operations of this country. The knowledge obtained from his long and thoughtful experience is consecutively well arranged, and every subject is treated in plain stylo with language familiar to ordinary readers; all the sections of mineralogy, exploration, assaying, mining and metallurgy aro teeming with appropriate originality, and contain vast quantities of useful information not found elsewhore; whilst the writer has shown an intimate knowledge of all the numerous subjects treated, and has fully sustained the title, by supplying a most efficient *companion* to the miner and metallurgist.—[S. F. Republican.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Francis Mining Company—Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 14th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Trustees.
T. J. CRONISE, Secretary.
Office, 409 California street, San Francisco, Cal.

Ingomar Silver Mining Company—Location of works, Ely Mining District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 31st day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Trustees.
CHAS. S. NEAL, Secretary.
Office, Room 21, Hayward's Building, No 419 California street, San Francisco, California. ap8-tt

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of April, 1872, an assessment of Three Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 27th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 17th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
R. H. CORNELL, Secretary.
Office, No. 220 Clay street, San Francisco, Cal. ap27-4w

Lyons & Wheeler Mining Company—Location of works, Maynard Mining District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States coin, to the Secretary, at the office of the company, Room 3, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Wednesday, the 15th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 3d day of June, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.
T. W. COLBURN, Secretary.
Office, Room 3, No. 419 California street, San Francisco, California. ap13

Marcelina Silver Mining Company.—Location of Works: Eureka District, Lander County, Nevada.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the Eighth day of March, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Am't.

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of March, 1872, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the salesroom of Maurice Dore & Co., No. 327 Montgomery St., on Wednesday the eighth day of May, 1872, at the hour of 11 o'clock, A. M., of said day, to pay said deliuquent assessment, thereon, together with costs of advertising and expenses of sale.
E. J. PFEIFFER, Secretary.
Office—No. 210 Post Street, San Francisco.

BONNEY'S PATENT HAY RAKE.

The only Rake that gathers all the hay upon the roughest as well as upon the smoothest ground, free from dust and dirt, and does not roll and wad it together. Has extension teeth to preserve its holding capacity, giving it a very great advantage over those of stationary teeth.

First Premium at the State Fair. Every Farmer Should Have One.

PATENT GRAIN LIFTERS,

For use on Headers in cutting Grain thrown down by the Wind or Rain.

The Cheapest and Best in the Market.

Are Light, Strong and Durable, and can be adjusted to run at any inclination to the ground, as at D in cut. A party can save more than the price of a set additional, in cutting grain that is down, in one day's run.

Manufactures also Draper Aprons, Grain Carriers, Straw Carriers and Farming Implements generally, all of the best material and workmanship.

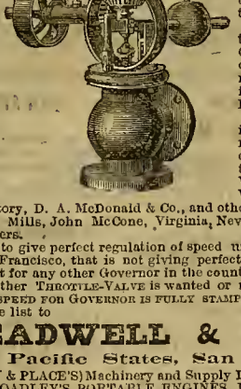
Also, Wood-working Machines, such as Band Saws, Circular and Jig Saws, Shaping Machines, etc.

Improved Pattern of Band Saws, equal to the high priced Eastern Saws, in work, at one-half the cost. Warranted to give satisfaction.

All orders to O. BONNEY, Jr., 221 Mission Street, San Francisco, Promptly attended to.
State and County Rights for Grain Lifter sold by WIESTER & CO.,
8v3-1am6m No. 17 New Montgomery street (under Grand Hotel), San Francisco.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Churry, Albany, Oregon, and many others.

☞WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK OR FINISHED Governor is desired. **THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the sixteenth (16th) day of April, 1872, an assessment of Forty Cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company. Any stock upon which said assessment shall remain unpaid on Monday, the twentieth (20th) day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the nineteenth (19th) day of June, 1872, at the hour of 2 o'clock P. M. at the office of the company, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
J. W. CLARK, Secretary.
Office, 418 California street, San Francisco. ap27-4w

Silver Wave Mining Company—Location of works, White Pine Mining District, White Pine county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the Tenth (10th) day of April A. D. 1872, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of said company. Any stock upon which said assessment shall remain unpaid on Tuesday, the fourteenth day of May, A. D. 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the Thirteenth (13) day of June, A. D. 1872, at the office of the company, at 2 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
J. W. CLARK, Secretary.
Office, No. 418 California street, San Francisco, Cal. ap4w

Ophir Copper, Silver and G. M. Company.—Location of Works, Ophir, Placer County, Cal.

Notice.—There are delinquent upon the following described Stock, on account of assessment levied on the 18th day of March, 1872, the several amounts set opposite the names of the respective shareholders as follows:

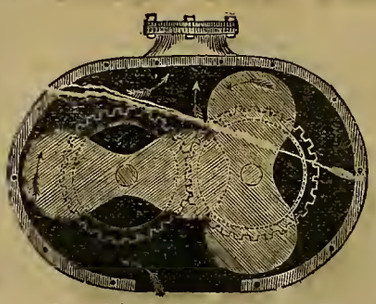
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

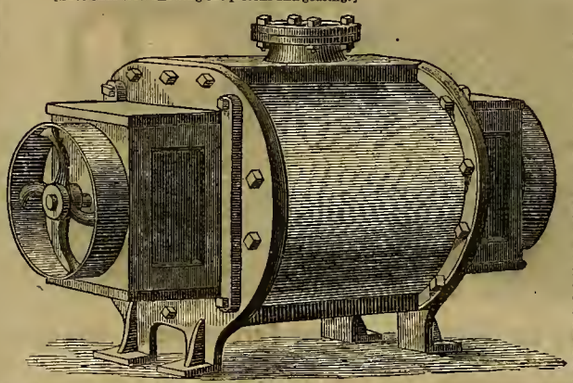
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. **Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.**

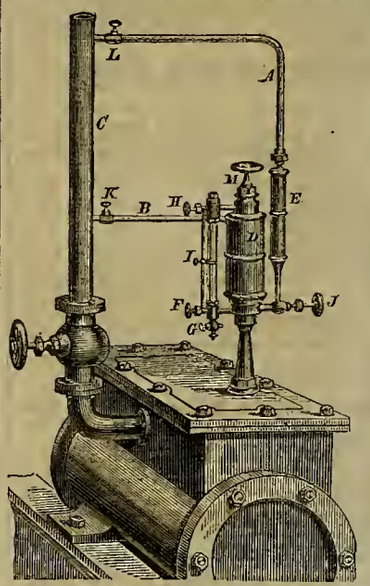
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

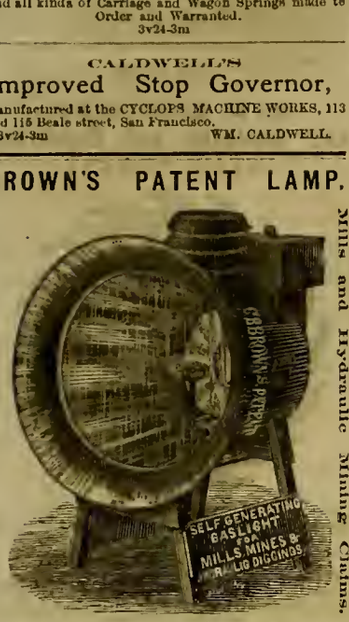
BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

For further particulars address

C. B. BROWN,
7v24-t Placerville, Cal.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will ho spared, to havo thom constructed in the most perfect manner; and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pnlp, or with steam bottoms, as desired.

This Amalgamator Opsrates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. Tho curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into tho quicksilver, nntil the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the samo principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco :

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS,
WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco :

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pnmp received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding.* Hooker's Hand Pump was the *only* Pump, of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pnmps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave hut 60 per cent., showing great difference in ecouomy.

The Blake Pump is the ONLY *Steam Pump that* EVER RECEIVED A SILVER MEDAL *at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.*

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

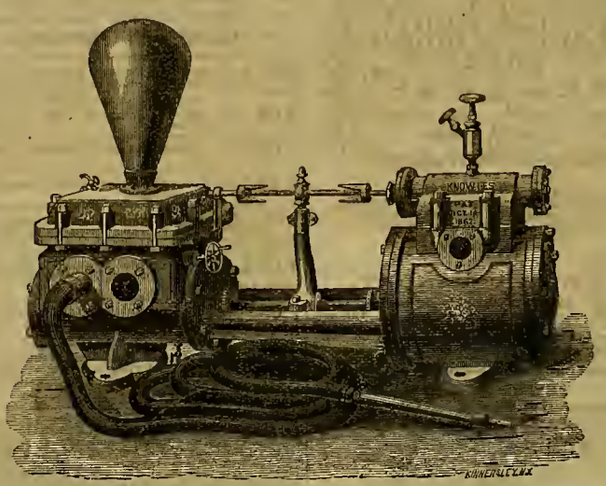
TREADWELL & CO.,

12v3-awbp Market street, corner of Fremont, SAN FRANCISCO.

KNOWLES' PATENT STEAM PUMP.

Received the Highest Award---A Diploma---

Over all Steam Pump Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without nsing a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to yonr inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station nse. I consider the Knowles Steam Pump the best in nse, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-cow-bp

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

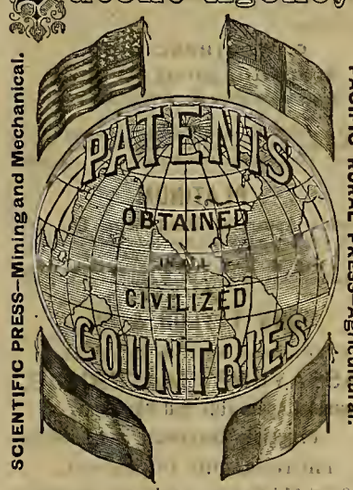
Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.



SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

The principal Agency on this side of the continent. Established in 1860. Inventors can rely upon the surety and dispatch of all important and confidential business intrusted in our hands. Long familiarity with Mining, Farming, and all other classes of inventions on this coast, enables us to give the most intelligent advice to PACIFIC COAST INVENTORS of any Agency in the Union, and oftentimes save unnecessary delay and expense. Every branch of the patent soliciting business attended to. All WORTHY INVENTIONS patented by us will be liberally noticed, free, at the most desirable time for the patentee, in both the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS.

Send for our 52-page illustrated PATENT CIRCULAR, mailed free on receipt of stamp. Also the U. S. Patent Law of 1870.

Mining Stocks.

The mining shars market has reached a point little expected a few weeks ago, and many believe that it will yet go higher. The business of the San Francisco Stock and Exchange Board has become so large that the Board, at a meeting on Saturday evening, decided that henceforth the Board Room shall be open from 9 A. M. until 5 P. M. These hours will be disposed of as follows: From 9 to 10:30 there will be an informal session; from 10:30 to 12 the regular sessions will he held; from 12 to 3 informal sessions, and from 3 to 5 the Board will be in regular session. All street transactions are to he strictly prohibited. This is a good move and will do away with the evils of making sales and transacting business in general on the streets. The example is not only had hut the brokers are a great inconvenience to pedestrians who are compelled to pass where they "most do congregate." A proposition was also considered but no definite action taken as to the propriety of adding 20 new seats to the Board, at a fixed price of $5,000 each. There is little doubt hut that they could be immediately disposed of if they were added.

The excitement in stocks still continues with little abatement, although on Wednesday there was a general reaction which, however, recovered somewhat on Thursday. The number of newly incorporated mining companies is increasing wonderfully. The great excitement in mining matters on the coast, has no doubt, led to this, and many long-neglected veine will be opened. The new mining law by which the stockholders may remove the trustees under certain circumstances, has also had a beneficial effect in drawing out capital that would have otherwise been placed in some other channel. It has given increased confidence in mining metters to the public and now when they are assessed they can call some one to account for the money if they desire.

Some of the Comstock mines have sold at higher rates than ever before; Crown Point selling at $1,700, buyer 30. The high rates of some of these mines have induced the trustees to call meetings of the companies with a view of increasing their capital stock and numher of shares, so as to place them within reach of all. A number of people are mentioned who have made fortunes in the present rise, and of course, everybody wants to invest. The excitement has at least called the attention of many to our mining interests, who otherwise would never have thought of buying and will douhtless have the effect of causing many of our mines to be explored with more vigor and more success.

DIAMOND DRILL.—The Sutro Tunnel Company have purchased the right for manufacturing and using the Diamoud Drill in their tunnel and all its branches. After a trial, which was completed to their satisfaction, they purchased the trial drill and this right. They expect soon to be using from 8 to 14 of these drills and complete the work in one half the time which it would have taken in working by hand, and at a much less cost. This drill is destined to exercise an important influence in large operations in the mineral developments of the Coast, doing more labor at lees cost and trouble than by any other means. The Sutro Tunnel Company ehow their real enterprise in employing this apparatue, since they will get into tho Comstock mines much quicker than they would have done without it and save money in the bergain. Its capacity will no doubt be well tested in the work it has before it.

Petersen's Patent Bee Hive.

Our cut is illnstrative of a new bee hive, recently patented by Peter O. Petersen, and is claimed to possess merit over the ordinary hive. Among the paramount objects secured by this hive are the facility it affords of examining at all times the stores of the bees, and the taking away of any surplus, or supplying whatever may be wanting. Also the presence and state of health of the queen bee, in fact of the whole hive. It enables the keeper to interfere in all sorts of emergencies; increasiug the number of becs, by artificially creating young swarms; and what is of especial importanco to tho progress of bee science, can be thoroughly examined with reference to the behavior and habits of the different bees, queens, drones and workers.

Persons familiar with the habits of hees know that one of their most necessary and freqnent employments is the expulsion of the overheated and foul air from the hive. To do this, the bees station themselves at or near the opening n the hive, turning their heads inward, take ihold with their feet and move their wings with such rapidity as to cause a considerable current

PETERSEN'S PATENT BEE HIVE.

of air, frequently causiug a draft strong enough to be perceptibly felt outside the hive. The improvements in this hive consist in providing it with suitable openings both above and below by means of which the necessary ventilation can be secured and regulated.

The hive has a gable roof, and at intervals in the upper edge of the side walls saw cuts or kerfs are provided which will be sufficiently wide to afford a passage for the air. A strip is secured between the projecting eaves and side of the hive so as to leave a triangular space extending from end to end of the hive and thus provide a passage for the air. By stopping up the ends of this passage the ventilation is shut off. Near the bottom of the hive is a false bottom, the side edges of which are also provided with saw cuts or kerfs. At short intervals and in the lower edge of the sides of the hives other kerfs are cut so as to break joints with the first mentioned.

In the lower corners of the hive are narrow wooden strips which cover the side kerfs when in place and shut off the draft from below entirely. As soon as the queen commences to lay eggs and the weather is favorable, the top ventilator may be opened. The constant, rapid motion of the wings of the bees in the hive will then expel all foul air which may be generated from the great quantity of pollen which the bees gather for the consumption of the young broode in the cells. If the weather ie eteady and the warmth increases, one side of the bottom of the hive is opened and if the weather is very hot, all the ventilation possible is given.

In very changeable weather it will be necessary to regulate the ventilation by the bottom slides entirely, and they should only be allowed to remain open when the weather ia favorable and constant. The top ventilator may, however, he left open during summer, no matter what kind of weather may occur. The hive is thus thoroughly ventilated, and at the same time daylight will be excluded. This hive has been pateated through the the SCIENTIFIC PRESS Patent Agency, hy P. O. Petersen, who may be addressed corner of Twelfth and Clay streets, Oakland, Alameda County.

Ball's Water Elevator.

Our illustration represents a novel device for drawing water from wells, the invention of Mr. Jno. A. Ball, of Grass Valley, in this State. An ordinary curb or box is used over the well across the upper open end of which a shaft which is turned by a crank in the usual way, passes. This shaft carries two chain pulleys a short distance apart and around each of these pulleys a linked endless chain passes. The buckets are secured to these chains at various points, as many beiug used as desired. Each of these

BALL'S IMPROVED WATER ELEVATOR.

buckets have a hole in its bottom which is covered by a clapper valve of ordinary construction. The huckets are connected with the chains at a point below their middle line, and a link connects their upper end with a cross bar which connects the chain so that when they are being lifted by the chains they haug vertically. A lever passes down into the bucket and is connected with a cross rod near its lower end. The lower end or short arm of this lever is attached to the clapper valve above mentioned, while the upper end or long arm is secured to a cross-rod which connects the chains above the bucket. Now it is plain that as soon as the bucket arrives at the pulleys the links as they strike the circle keep the buckets in a perpendicular position until they begin to draw downward upon the reverse side of the pulley, and the same movement causes the lever to lift the clapper valve andallow the water to pass down through the spout, seen beneath the bucket, and into the curb-spout while the bucket is held in the vertical position, after which it is carried over the pulley and down into the well again.

By this means the water is delivered without waste. The inventor claims that the water from welle cen be drawn cooler for the reason that the buckets take it from the bottom. The action of the chain and buckets keep the well ventilated properly, and the whole apparatue can be moved from one well to another easily, there being no pulley or other machinery below. Thie obvietes all necessity of going down the well to make repairs or putting in machinery, as such labor can be performed at the surface. The hucket can be lowered backwards into the well so as to allow the water to rise through the valve into the bucket, thus permitting of a quarter or a half of a bucket full being raised as desired. The whole arrangement is simple and effective. All of the good qualities of the "Old Oaken Bucket" are preserved and its bad qualities made good. As a means of drawing water from an open well itis certainly valuahle. Mr. Ball has a United States Patent upon this elevator which he is now reissuing through the SCIENTIFIC PRESS Patent Agency.

NEW METHOD OF PROSPECTING.—The North Bloomfield Gravel Mining Company have, according to the Nevada *Transcript*, withdrawn their property in Nevada county from the market, and will immediately commence to thoroughly prospect their claims. A tunnel 9,000 feet long, is to be run from Humbug Creek so as to drain the North Bloomfield Basin. They are going to try a new plan in opening the shafts. Three shafts are to be snnk on the line, and when they are down to bed rock the tunnel will be worked each way. In opening these shafts a hole is to be bored the full depth to which the shafts are intended to be sunk, that is, till they strike the tunnel level. The hole is to be filled with sand, and when they wish to put in a blast, as much sand will be taken out as will be necessary to leave a hole of the proper depth. By this means as soon as they commence work, they expect to be able to hlast and sink as fast as sand and dirt can be dug out. Great confidence is felt in the favorable results of this plau, and it is shortly to he put into execution. It seems to us, however, that unless more than one hole were bored the plan would not work very well, since the men would still have to drill others by hand in the corners. If one hole were bored in the middle of the shaft and four more around it and then all the blast fired simultaneously there might he some advantage in it; for boring the holes first by machinery, as proposed above, would assuredly cause a saving of time and the shafts would go down rapidly after blasting once began. It is likely, however, that the question will be practically tested by the parties mentioned above.

PATENT DECISION.—In a late decision of the Commissioners of Patents in the case of Armistead vs. Blackwell, concerning an interference in the well known trade mark of the Durham smoking tobacco, the Patent Office decided in favor of Armisteed. The decision was to the effect that Wright, the assignor of Armistead, had a legal title to the word "Durham" as a trade-mark for smoking tobacco, and that Armistead acquired title to it from bim. That the word was not originally adopted as the distinctive name of a locality, or to show that it was manufactured or sold at a place called Durham; but that it was purely a fancy designation, adopted as an arbitrary symbol to denote that peculiar product.

SIME'S BANK.—In the failure of John Simes & Co., recently, the real estate only paid depositore 50 cent on the dollar, but among the assets was a quantity of mining etock which the recent advance has appreciated so much that the bank will pay dollar for dollar and it is said leave a surplus of upwards of $20,000. Mining stocks are not always a bad investment by any means ae the creditore of thie institution will no doubt now allow. It ie seldom we hear of a broken bank coming to life especially after the banker's death.

CORRESPONDENCE.

Vein Phenomena.

[Written for the PRESS by A. J. BROWN.]

Influence of Enclosing Rocks on the Character of True Veins.

EDITORS PRESS:—Two of the late numbers of the SCIENTIFIC PRESS, March 9th and 16th, contain interesting extracts from a lecture by Professor Smythe, wherein reference is made to the effect the "country or enclosing rocks produce on the metallic character of true veins."

The subject is certainly of the utmost importance to every mining engineer, and almost equally so to all persons engaged in mining enterprises, and is well worthy of a careful investigation. Furthermore, the study of the subject, aside from its importance in a practical sense is highly interesting.

That some such theory has generally obtained credence among miners we may infer from the fact that they have for a long time laid particular stress upon the character of the formation in which veins occur, and have accepted or condemned new districts according to their preconceived notions of the favorable or unfavorable character of the enclosing rocks. But, many of the popular theories in regard to veins, have been proven to be popular fallacies. For instance, about the time of the discovery of the Reese River mines, it was the generally accepted theory that veins invariably grew richer in depth until water was reached and sulphuret ore found. Still later, at the time of the discovery of Reveille Hot Creek, and other limestone, mineral bearing formations, the theory was promulgated that silver could not exist in limestone, (however favorable it might be for the development of lead ores); but the discovery of White Pine and its extensive deposits of free silver ore of unequalled richness, proved too much for the theory, and it gradually yielded to the pressure of circumstances, only to be replaced by another, far more pernicious in its effects on mining industry. To-wit: That deposits in limestone were not permanent in depth. But this, like the others named, is certainly and surely being disproved by the stern logic of the pick and drill. Limestone deposits are quite as likely to continue in depth as those are in other kinds of country, with this difference—that true veins are a sure guide to the miner in his search for deeper ore bodies, while in limestone there if often nothing but a stained seam or slip (and sometimes not even that) to guide him in his further search.

Perhaps this theory of the enclosing rocks influencing the "metallic contents of veins," may not be able to stand the test of a rigid investigation; but apparently the weight of evidence, so far, strongly tends to its support, particularly as regards such metals as are usually found in nature as chemical compounds—such as silver, copper, lead, antimony, etc., and perhaps in a lesser degree gold also—lead ores appear to have a marked affinity for limestone in all countries and under nearly all circumstances, and here we may find the explanation of the cause of the "complicated association of base metals found in eastern Nevada and Utah," by far the largest portion of the mining districts being situated wholly in limestone. To fully establish this theory careful and extended observations must be made over a wide extent of mineral country, not only of the physical characteristics of the enclosing rocks, but of their chemical composition also. From present appearances

The Eastern Part of the "Great Basin"

Will in the future furnish excellent facilities for the study of vein phenomena. In most of the noted mining localities the veins or deposits occur in stratified rocks, either limestone or slate, mainly in the former. In some of the districts the upper mineral bearing strata are fully exposed, and are known to be of limited thickness to another underlying formation very different in character and composition. In such cases it will be interesting to note the change, if any, that occur in the mineral character of such veins or deposits with the change in the formation. Evidences of the influence of the enclosing rocks on the "metallic contents of veins," are apparently not entirely wanting in eastern Nevada; but owing to the almost undeveloped condition of the country, and the total absence of deep works such evidence is merely superficial, and perhaps by no means conclusive, yet the most superficial observer must necessarily note the great difference in the type of minerals occuring even in limited localities, sometimes even in different parts of the same vein, and that every such change is accompanied by a considerable change in the lithological character of the formation. Furthermore, whenever the minerals are identical, even in localities remote from each other, a remarkable similarity in the enclosing rocks is plainly observable.

Reveille and Schell Creek are two hundred miles distant from each other, yet the minerals are almost identical, both yielding silver glance, copper, silver, glance and chloride or horn silver, with occasional traces of metallic silver, and the Schell Creek ores contain in addition, traces of antimony. Dolomite in both cases is the prevailing formation. The same formation occupies the free metal portion of Treasure Hill, and probably the original mineral was mainly silver glance, and the present combination of silver with chlorine, is the result of the complete decomposition of the original compound. Nearly every district situated in the stratified rock of the eastern part of the State, furnishes examples illustrative of this theory, and some of them will be referred to further on; but, first I propose to consider

The Relations that Limestone Deposits Bear to true Veins.

Apparently the country rocks not only influence the mineral contents of veins, but in some cases determine the vein character also. Instances are not wanting of true veins in slate, granite, etc., losing their vein character on passing into a limestone formation, and again assuming it on passing into another formation favorable for vein developments.

Eastern Nevada and Utah contain an almost unlimited number of limestone mineral-bearing localities. Fully three out of every five districts so far discovered are situated in limestone, varying in geological age from the lower Silurian to the Upper Devonian. In fact, in almost every instance where limestone has been discovered older than the Carboniferous, valuable minerals have been found associated with it. But few of the districts have as yet attained to much importance as mining centres; yet the majority of them are of fair promise, and their future worth is only a question of time and capital. Hence the vast extent of country occupied by limestone and the great number of important districts already found exclusively in that formation, render the study of its peculiar mineral system of the utmost practical importance. True fissure veins are said not to exist in limestone. To a certain extent this is probably true. True veins in the general acceptance of the term, are probably rarely or never found in genuine limestone; and even those veins inclosed in calcareous shales and schists are apparently intermediate between deposits and true veins, and partake to a certain extent of the character of both. Nevertheless, fissures do exist in limestone, but various causes prevent their being classed as true veins, the most important of which are the absence of well defined walls, and the extreme irregularity often exhibited by the vein itself, sometimes pinching to a mere seam, then gradually expanding into deposits frequently of vast extent; and, such indeed is the condition of affairs to be expected when we take into consideration the soluble character of this formation in the presence of carbonic acid, a substance common to all natural waters. Consequently whenever the thermal waters have had free access to the walls of the fissure, chambers often of large dimensions would be hollowed out and afterwards, or perhaps simultaneously filled with ore bearing material, while the dissolved lime held by the water would be deposited as calcite, whcrever the conditions were favorable, which would probably often happen to be in parts of the same fissure. Thus we would have deposits of varying dimensions in those parts of the vein exposed to the eroding action of the water, alternating with narrow and perhaps barren seams in other parts that were by some means protected from its action. In veins having considerable underlie, so that the foot wall would support the solid impurities deposited from the water, thereby protecting it from its eroding action, we would naturally expect to find that wall comparatively smooth, while the hanging wall, having no such protection, would be eroded into irregular chambers. And such indeed we find to be the condition of affairs observable along the main ore channel of Treasure Hill. For there while the west or foot wall is fairly defined and smooth, the eastern or hanging wall is very irregular and is penetrated by all the large deposits on that line. This class of veins are often vertical, or nearly so, seldom having much underlie, and are designated by English mining engineers as "pipe and rake veins." There are two other classes of deposits found in limestone formations, that are more difficult of classification, as both alike appear to be but mere arbitrary deposits having no connection with any vein system whatever. One of these is in reality what it appears to be, nothing but superficial deposits, without order or arrangement in their mode of occurrence. They are generally confined to the bedding of certain horizontal strata, and are evidently formed by the mineral waters percolating through the strata from some adjacent "ore channel," dissolving the limestone and depositing silver and ore of silver or other metals in its place.

The other class is far more important from a practical standpoint, as its minerals are evidently derived from a deeper source, and therefore may reasonably be expected to show greater permanency in depth. The deposits of this class penetrate the underlying strata to considerable depths. They likewise show a considerable degree of order in their mode of arrangement. They are mostly found within well defined limits, frequently forming a continuous chain of deposits several miles in length. In their course they generally coincide with the anticlinal axis of an extensive upheaval of the country rocks; but in some cases they appear to lie nearly or quite over such axial lines.

The main belt of Treasure Hill, has a length north and south of more than four miles, corresponding throughout with the axial line of the upheaval. It is also accompanied by a large vein of spar or calcite, which in all cases marks its western boundary. The strata overlying the belt is considerably faulted for the greater part of its length, thus furnishing conclusive evidence of the fractured and disturbed condition of the underlying strata. The same phenomena also occurs in Schell Creek. There the main belt follows the axis of the range for something like twenty miles. It is accompanied by unmistakable evidence of the violent action of mechanical and chemical forces,—such as the fracture and faulting of strata, and the alteration of the stratified rocks. A series of volcanic outflows along the west side of the range has deluged that part with volcanic rocks. There is also a strong presumption that the slight upheaval accompanying them has fractured the strata underlying the main belt. In short, all the circumstances attending both the great mineral belts above noticed, as well as others of the same class, tend to produce the impression that they overlie great rents or fissures in the deep underlying strata, which gave vent to the solfataras that formed the deposits; or in other words that the fissure veins in the deeper strata have been changed into deposits in passing through the limestone.

Treasure City, Nev., April, 1872.

[To be continued.]

Mining, the Great Pursuit of the Pacific States.

Written for the PRESS by A. B. PAUL.

When the vast area of mineral lands, comprising California, Nevada, Arizona, Montana and Idaho, are considered, and the immensity in numbers of mineral bearing lodes are realized by observation, the question will arise, what pursuit equals mining in extent? It is all idle to talk about manufacturing as being the leading interest of the Pacific States, with labor at its standard. That farming is to rule, with season so uncertain, or that either are more legitimate than mining. I do not propose to deprecate either; all are necessities, and should have the fostering care of capital and industry; but when it comes to that pursuit which is to absorb the largest amount of brains and capital, to be the leading branch of industry of the Pacific States, it is mining, and the sooner it is an admitted fact the better will it be for all branches of industry, as well as mining itself. As miners and business men, more or less connected with mining and its results, all are getting their brains wonderfully pried open to what they were years ago. Who then could realize the fact that 12 inches of any mining ground could be sold for $25,000 cash? that any one mine could produce 500 tons of ore in one day, and yield more than a half a million dollars in a single month. And yet all this has been *exceeded*. Who will say that it is impossible, after what has been done within the past year, to double our bullion product in the next. What are Sutro Tunnel enterprises in comparison with the operations now going on on the Comstock? And yet that has been viewed as such a gigantic undertaking.

Large ideas lessen when larger ones present themselves, and it is in this sense that we are only learning to mine, and in proportion as we enlarge our ideas, and accept mining as a legitimate pursuit, will our prosperity increase. That a brighter day is opening for the Pacific coast, no one can question; that prosperity is based on our attention to mining.

The whole business history of this coast shows that when we mined most all branches of business were more prosperous; that when we deserted it, we deserted our own interest. Mining now is in the advance, but not so much so as it is to be.

The future seems clear to my mind, but I will not predict. Let us have some care for others as well as ourselves; give English, Eastern or any capital legitimate mines for their coin; eschew "wild cat" mining, and by so doing mining not only becomes a legitimate pursuit, but the great leading interest of the Pacific States. With it comes population, manufactures and commerce.

DANGER OF MINING.—Two hundred and seventy-two miners were killed and 622 wounded in the Pennsylvania anthracite coal region last year, making 220 widows, and 500 or 600 orphans. The Scranton *Republican* says that about one-third of the whole number of the killed met their death on account of neglect of operators to make second openings to their mines. Another third were killed by the explosion of gases, which would have been averted, if the law required every mine to be examined by an experienced miner with a safety-lamp, before the workmen enter it, had been complied with.

The Countries Where Gold Goes.

In the reign of Darius gold was thirteen times more valuable, weight for weight, than silver. In the time of Plato it was twelve times more valuable. In the time of Julius Cæsar gold was only nine times more valuable, owing, perhaps, to the enormous quantities of gold seized by him in the wars. It is a natural question to ask: What became of all the gold and silver? A paper read before the Polytechnic Association by Dr. Stephens is calculated to meet this inquiry. Dr. Stephens says of our annual gold product, fully fifteen per cent. is melted down for manufacturing; thirty-five per cent. goes to Europe; twenty-five per cent. to Cuba; fifteen per cent. to Brazil; five per cent. directly to Japan, China and the Indies; leaving but five per cent. for circulation in this country.

Of the gold which goes to Cuba, the West Indies and Brazil, fully fifty per cent. finds its way to Europe, where, after deducting a large percentage used in manufacturing, four-fifths of the remainder is exported to India.

Here the transit of the precious metal is at an end. Here the supply is absorbed, and never returns to the civilized world. The Orientals consume but little, while their productions have ever been in demand among the Western nations. As mere recipients these nations have acquired the desire and habits of accumulating and hoarding, a habit common alike to all classes among the Egyptians, Chinese and Persians. A French economist says, in his opinion the former nation alone can hide away $20,000,000 of gold and silver annually, and the present Emperor of Morocco is so addicted to this avaricious mania that he has filled seventeen large chambers with the precious metal. The passion of princes, it is not surprising that the same spirit is shared by their subjects, and it is in this predeliction that we discover the solution of the problem as the ultimate disposition of the precious metals.

This absorption by the Eastern nations has been uninterruptedly going on since the most remote historical period. According to Pliny, as much as $100,000,000 in gold was in his day, annually exported to the East. The balance of trade in favor of those nations is now given as $80,000,000.

An American Iron Steamship.

Philadelphia expects to be able to present to the commercial world in a few days the novel spectacle, in American waters, of the launch of an American iron steamship built of American materials, owned by American capital and to be manned by American seamen. The craft is the pioneer of the American Steamship Company of that city. She is 3,016 tons burden, old measurement, 355 feet in length, 43 feet beam, and will be furnished with independent compound, vertical, direct acting, surface-condensing, propeller engines. The steamships of this line are to be arranged to carry 75 first-class and 854 steerage passengers, the total cost of the four to be $2,080,000, and they are to be named respectively the "Pennsylvania," to be completed September 1st, 1872; "Ohio," to be completed November 1st, 1872; "Indiana," to be completed December 1st, 1872; and "Illinois," to be completed January 1st, 1873.

ACCIDENT AT THE NEW EUREKA MILL.—Yesterday one of the two large line shafts which run the pans at the Eureka mill, Carson River, suddenly broke in two. The only noticeable effect of the break in the mill was the sudden stoppage of one whole row of pans. But for a governor, very similar to those used on steam engines, the powerful water wheel would have made things very lively in the mill; but, as it was, the governor instantly shut off about half the supply of water going into the wheel, and instead of a storm the usual calm continued. The shaft broken was five inches in diameter. To guard against similar accidents in future, Abe Edgington, Superintendent of the mills of the Union Mill Company, seeing this accident, at once telegraphed to San Francisco to have sent here, 8-inch shafts. The 5-inch shafts were quite large enough had the mill been running at the calculated speed, but having concluded to rush matters, the speed at which they were running was too much for even five inches of solid wrought iron.—*Virginia Enterprise, April 21st.*

FOUR new steel guys have been put in position on the New Suspension Bridge, at Niagara Falls. These guys are considered one-third stronger than the common ones in use.

MECHANICAL PROGRESS.

REMARKABLE TESTING MACHINE.—The *Engineer*, in an article on the strength of materials, speaks of the wonderful testing machine of Mr. Kirkaldy, in London, and of the results obtained thereby. The machine is capable of breaking a heavy girder or a half-inch bar, of pulling asunder a thin wire or the shank of a bolt down anchor, or crushing a great cube of cast iron or a common brick, and yet in all cases giving results strictly comparable and accurate. It has been in constant operation for over six years, and is now thought to have been brought to the limit of perfection. It can exert either a compressing or a tensional strain of over 350 tons with perfect safety. It will take in bars or columns of greater length than are generally used in construction, and it will test girders for transverse strain of any depth, and any length up to 30 feet, provided they are not more than 13 inches wide, measured across the flanges, the length between the supports while under test being 26 feet. The arrangements for measuring and recording the stretch and load on any specimen are extremely simple and ingenious, and heavy as the machinery is, the finish is so good, the knife edges so accurate, and the motion of the more massive portions so slow and so easy, that practically perfect accuracy is obtained. Mr. Kirkaldy has made most valuable and interesting experiments in iron, steel, building materials, alloys, springs, India rubber, tubes, belting, ropes, etc.

PRIVATE GAS MANUFACTURE.—Mr. Symes, of England, has lately patented a portable gas apparatus for small consumers, for which important claims are made and which is described in the *Jour. Soc. Arts*. It consists of a circular box or iron retort with a cover fitting into place like a valve so that no luting is necessary. In this is placed the gas-making material, which may consist of coal, wood, peat, in fact of any solid combustible house refuse. The retort may be placed and heated in an ordinary stove or kitchen range. The gas formed passes first into a tank of water, where it is deprived of certain impurities. This tank or main is ingeniously constructed with a safety valve, means of regulating the amount of water and hence the pressure, etc. Thence the gas enters a condenser, at the foot of which is a purifier, and from this passes into a gasholder and thence to the burners. The construction is said to be remarkably ingenious and simple. The apparatus requires very little attention. The first cost of the apparatus for 25 to 30 lights is given as 20 and 25 shillings ($5 and $6) per light, the rate decreasing with every increase of light. Made from "slack," the cost of the gas is estimated at 25 cents, from coal at $4¼ per ton with 10 per cent. cannel at 45 cents, per 1,000 feet. The illuminating power is reported as equal to 18 candles or more, while the purity of the gas is stated to be perfect.

COPYING PRESS.—A clever application of science to commercial purposes has been made by an Italian gentleman, M. Eugenio de Zuccato, of Padua. By means of the invention any number of copies of a manuscript or design, traced upon a varnished metal plate, may be produced in an ordinary copying press. The *modus operandi* is very simple. To the bed and upper plate of a press are attached wires leading from a small battery, so that when the top of the instrument is screwed down the two metal surfaces come into contact, and an electric current passes. An iron plate resting upon the bed of the press is coated with varnish, and upon this surface is written with a steel point any communication it is desired to copy. The letters having thus been formed in bare metal, a few sheets of copying paper are impregnated with an acid solution of prussiate of potash, and placed upon the scratched plate, which is then subjected to pressure in the copying press. An electric current passes wherever the metal has been left bare, (where the writing is therefore,) and the prussiate solution acting upon the iron, there is found prussiate of iron or Prussian blue characters, corresponding to those scratched upon the plate. The number of copies that may be produced by this electro-chemical action is almost unlimited, and the formation of the Prussian blue lines, is, of course, instantaneous.—*Nature*.

MECHANICAL IMPROVEMENTS.—The substantial growth and prosperity of every town or city is based upon its mechanical improvements and industrial resources. Wherever the hum of machinery is heard, and the manufacture for any article is established, there, it may be safely asserted, are the true elements of thrift and progress; because production is the life of trade, and through the channels of trade flows the life-blood of the civilized and commercial world. Hence, the vital importance to all sections of establishing manufactories. Too long, alas! have they relied upon the workshops of New and Old England to supply them with cloths for raiment and implements for labor. Too long have they looked elsewhere for articles of daily use which might have been easily produced at home, by the proper application of a little capital, enterprise and labor. It is to this suicidal policy on the part of the people, that may be attributed to their present poverty and dependence.—*N. J. Mechanic*.

INFLUENCE OF INTENSE COLD ON STEEL AND IRON.—The correctness of the popular idea (strongly encouraged by railroad companies) that intense cold renders iron and steel more brittle, and may hence occasion the fracture of the tires of wheels during severe frost, which has caused many deplorable railway accidents, has long been doubted by practical physicists. The subject has now been again investigated; and from some papers read at a recent meeting of the Manchester Literary and Philosophical Society, (and published in *Nature*, No. 65, Jan. 26) by Sir W. Fairbairn, Dr. Joules and Mr. Spence, it would appear to be satisfactorily determined that a low temperature has no effect in rendering iron more brittle. Dr. Joule's experiments were particularly decisive, and consisted of applying weights suspended from the middle of steel needles at different temperatures, and letting the blunt edge of a steel chisel fall on cast-iron nails under similar circumstances. His general conclusion is that frost does not make either iron (cast or wrought) or steel brittle; and that accidents arise from the neglect of the railway companies to submit wheels, axles, and all other parts of their rolling stock, to a practical and sufficient test before using them.—*Eclectic Magazine*.

SHEATHING IRON VESSELS WITH WOOD.—Notwithstanding the acknowledged superiority of iron over wooden vessels for general service and durability, we have seen it stated that experience has shown the necessity for giving the former a protective sheathing of wood. At least this is the case on our great northern lakes.

The reason of this is, that touching at so many ports where the entrance is through narrow, rock-bound channels, there is much danger of striking a jagged point or the loose boulders on the bottom. In either case there is danger of puncturing a hole through the unyielding iron plates, which cannot be easily stopped or repaired without going into dry-dock. Wooden vessels, however, frequently strike even harder without receiving serious injury, the wood of the hulls being sufficiently elastic to receive the shock without the breakage of the shell sufficient to admit water, or so little as not to injure the cargo, nor require dry-docking, the damage being repaired from the inside, or a liberal use of pitch or oakum.

THE DANKS FURNACE—AN INVENTOR REWARDED.—It is stated that an agreement has been entered into between Mr. Danks, the inventor of a new puddling machine, and a combination of iron manufacturers representing the different iron districts in England, whereby the latter undertake to have 200 furnaces on his plan put up within six months, and, in consideration of his permission to do so, to pay him $250,000 at that time, whether the furnaces are in operation or not.

It is intended, on payment of a further sum, to erect 260 more, which with the 50 before arranged for, will make something like 450 furnaces in England alone. This is such a revolution as has never before occurred in the history of perhaps any industry, and the more is it to be wondered at when it is remembered that, till July last, it was thought that hand-puddling must for ever continue, every machine to do away with it having, before that, entirely failed.

COPYING DRAWINGS BY THE AID OF THE INDUCTION COIL.—All draftsmen are acquainted with the device of puncturing holes through a drawing for the purpose of obtaining an outline and afterwards transferring the outline, by sifting fine plumbago or other powder through the small holes. The fatigue of making the holes by hand is great, and M. Cauderay, of Lausanne, proposes to employ the induction coil for this purpose. A table covered with tin foil is connected with the negative pole, on it may be placed as many sheets of paper as the spark will pass through. The positive pole, consisting of a metal bar, insulated with gutta-percha, can serve as a pencil for copying the tracings. The metal point of the pencil being moved about on the contour and outline of the engraving, electric sparks spring across every time a connection is made, and puncture fine holes through the paper.—*Scientific American*

PHOTOGRAPHIC INVENTION.—Among the most remarkable of discoveries in photography is that claimed by one Johnson, an Englishman. The invention is a panoramic camera, which, by ingenius mechanism, sweeps the whole landscape and takes it on a plane surface embracing on one negative one-third of the circle. The exactitude of its operation is as singular as the beauty of the results. The pantoscope begins at one end of the view desired and goes round the horizon as one sweeps the telescope, the plate moving with a corresponding motion through the arc, which might be a circle if it were desirable.

STEEL RAILS.—Although we have no full statistics of the production and introduction of steel rails, it is still well known that their use is rapidly increasing. The follow figures are quite reliable:—8,500 tons in 1868; 12,000 tons in 1869; 45,000 tons in 1870 and 60,000 in 1871. It is very generally conceded that steel rails are to supercede iron in all the great railroads, turn-outs, sidings, etc., almost everywhere. Their first cost is about 50 per cent. greater than iron; but they last so much longer that there can be no doubt of their economy. No steel rail has yet been worn out.

SCIENTIFIC PROGRESS.

CURIOUS PHENOMENON OF RECURRENT VISION. In the course of some experiments with a new double-plate Holtz machine, says Prof. Young of Dartmouth College in the *Amer. Jour. Science*, I have come upon a very curious phenomenon which I do not remember ever to have seen noticed. The machine gives easily intense Leyden jar sparks from 7 to 9 inches in length, and of most dazzling brilliance, when, in a darkened room, the eye is screened from the direct light of the spark, the illumination produced is sufficient to render everything in the apartment visible; and what is remarkable, every conspicuous object is seen *twice* at least, with an interval of a little less than one-quarter of a second—the first time vividly, the second time faintly; often it is seen a third, and sometimes, but only with great difficulty, seen a fourth time. The appearance is precisely as if the object had been suddenly illuminated by a light at first bright, but rapidly fading to extinction, and as if, while the illumination lasted, the observer were winking as fast as possible.

I see it best by setting up in front of the machine, at a distance of 8 or 10 feet, a white screen having upon it a black cross with arms about 3 feet long and 1 foot wide. That the phenomenon is really subjective, and not due to a succession of sparks, is easily shown by swinging the screen from side to side. The black cross, at all periods of visibility, occupies the same place and is apparently stationary. The same is true of a stroboscopic disc in rapid revolution; it is seen several times by each spark, but each time in the same position. The is no apparent multiplication of a moving object of any sort.

Measuring roughly the interval between the succession instants of visibilty, in my own case the mean of 12 experiments gave 0.22 sec. as the interval between the first and second seeing of the cross upon the screen; separate results varying from 0.17 to 0.30 sec. Another observer found a mean interval of 0.24 sec.

Whatever the true explanation may turn out to be, the phenomenon at least suggests the idea of a *reflection of the nervous impulse* at the nerve extremities — as if intense impression upon the retina, after being the first time propagated to the brain, were there reflected, returned to the retina and from the retina traveling again to the brain renewed the sensation. I have ventured to call the phenomenon "recurrent vision."

It may be seen, with some difficulty, by the help of an induction coil and Leyden jar, or even by simply charging a Leyden jar with an old-fashioned electrical machine, and discharging it in a darkened room. The spark must be at least an inch in length.

NEW METHOD OF MEASURING THE VELOCITY OF ROTATION.—Prof. Dolbrae describes in the *Amer. Jour. of Science* a simple and exact way of doing this, which can be applied to measuring the velocity of wheels of any size, and every possible speed, without inconvenience or expense. The revolving disc is smoked on one side and a tuning fork, with a cone of india rubber fastened to one branch, made to vibrate while the disc is rotating. The point of the cone is touched to the disc. The number of undulations thus made once around the disc is counted. By this number the known number of vibrations made per second by the fork is divided and the result is the rate per second of the velocity. Thus if the fork makes 100 vibrations per second and there are two undulations in a single revolution, the disc turns 50 times per second. A single wave, or even half of one, is sufficient for the determination if the length be measured in degrees, in this case the velocity being equal to the number of vibrations of the fork per second, multiplied by the length of one wave in degrees, and the result divided by 360.

THE PROJECTED AUSTRIAN POLAR EXPEDITION. The results of the Austrian expedition of last summer have given rise to a strong attempt on the part of the Austrians to send another and larger expedition, the general plan of which was stated last December before the Vienna Academy of Science by Lieut. Weyprecht. The expedition is to be prepared for three summers and two winters as soon as the north coast of Nova Zembla is free from ice. A start will be made in order to reach the Siberian Islands the first summer if possible. The first winter is to be spent here and the second on the land which has been seen (but never reached) to the east of the New Siberian Islands. The objective point of the third summer is Behring Straits. If New Siberia cannot be reached the first summer, the expedition will winter the first time on Cape Tscheljnskin, the most northerly point of Asia, and reach New Siberia the second summer. The cost of the expedition is estimated at 175,000 gulden (about $80,000) of which some 45,000 gulden have been subscribed already. The building of a ship for the purpose has been commenced.

ROTATION OF THE SUN.—Zöllner and Vogel have succeeded in applying the spectroscope to the measurement of the velocity of the sun's rotation. Vogel found for the motion of a point on the sun's equator a velocity of 1.96 miles per second in one series of observations, and 1.64 miles in a second series. These velocities are greater than those at present admitted, and Vogel considers the observations at present as simply demonstrating the fact of the sun's rotation.

AURORAS.—Although auroras, says the *Mechanics' Magazine*, are much more frequently seen in latitudes north of ours than in our own, the North Pole is not the region around which the most splendid and magnificent displays of the northern lights are to be seen. As we travel further north from England, auroras become more and more common until a certain latitude has been reached, after which they become less frequent. And, strangely enough, the region in which the display is most commonly to be seen lies further north in some longitudes than in others. For example, an inhabitant of St. Petersburg would have to travel northwards to within 19 degrees of the Pole before attaining the region of the most frequent auroral displays. On the other hand, an inhabitant of Washington need only travel northwards to latitude 56 degrees to reach the place of the greatest auroral action. If we took a globe and marked down all the spots thus obtained, we should find that they formed a nearly circular band within which the North Pole would occupy a very eccentric position. In fact, we could represent the position of the band very well by constructing a ring of card or paper of such dimensions as to agree with the sixtieth parallel of latitude, and then pushing the ring down on the side of America and upwards on the side of Asia, until it passed through the most southerly part of Hudson's Bay and the most northerly part of Siberia. When fully formed, the auroral arch is a most symmetrical and beautiful apparition. It surrounds a space of slate-colored light, and from the arch itself luminous streamers dart with a quivering motion towards what is termed the magnetic meridian. Sometimes the ends of the arch are bent downwards near the horizon; but at others they are bent in a contrary direction. Hansteen relates that when he was at Christiana he twice saw the auroral arch in the form of a complete oval. Sometimes more than one arch has been seen. On one occasion the observers, who were sent by the French Government to winter at Bossekop, in Finland, saw no less than nine arches, separated by dark spaces, "and resembling in their arrangement magnificent curtains of light, hung behind and below each other, their brilliant folds stretching completely across the sky."

RESPIRATION OF FISH.—M. Grehaut, in the course of a lecture on respiration in fishes, states that, as shown by previous writers, fish are able to live in water until almost the whole of the oxygen it contains in a state of solution has been exhausted. This was shown by a chemical examination of some water in which live fish were preserved, and which, after the expiration of a certain time, showed an entire absence of oxygen, no change in the amount of nitrogen, and double the amount of carbonic acid.

Another curious fact noted by the lecturer was that fish breathe by their skin as well as by their gills, nearly as great a change in the composition of the gases contained in the water being observed when the animals were suspended up to their branchiæ as when the whole body was immersed. He also stated that the presence or absence of the swimming bladder had little effect on the product of respiration.

SPECTRUM OF THE ZODIACAL LIGHT.—This subject is intimately connected with that of the spectrum of the aurora, because Augstrom announced that the zodiacal light and the aurora both gave the same monochromatic spectrum. But Liais, the Brazilian astronomer, has lately been studying the zodiacal light under the very favorable sky of Rio Janeiro, and comes to a different conclusion. He finds that this does not differ from ordinary sunlight, but gives a continuous spectrum. It is, however, too faint to see any dark lines. This result is confirmed by Rev. T. W. Webb, of England, who has recently been observing the zodiacal light with a spectroscope which shows the auroral line very distinctly. He sees nothing like the green auroral line in the zodiacal spectrum.

MOVEMENT OF STARS IN SPACE.—General Dufour, of Switzerland, in the course of a recent investigation, attempts to show that in the case of the movement of two stars around a point supposed fixed, this point must be in motion. He also concludes that the curve is plane, and that the stars remain in the same plane during their translation; and the inference is that these stars have both received one impulse and a parallel movement, also that the movement of the apsides proves that the centre of gravity of the system is displaced not according to a straight line, but a curved one.

NEW FOSSILS IN KANSAS.—The first remains of Pterodactyls ever found in this country were fragments of a gigantic species, *P. occidentalis*, discovered by Prof. Marsh, in 1870, in the upper Cretaceous shale of western Kansas. The next year two other species, *P. ingens* and *P. velox* were found by the same party in or near the same locality (near the Smoky River), showing that the peculiar reptiles, so long deemed wanting in America, were apparently well represented here during the later cretaceous. They are described in the April *Amer. Jour. of Sci.*

FLORA OF THE CANARIES.—According to M. De Candolle, the flora of the Canary Islands, while containing scarcely any plant peculiar to the western coast of Africa, includes a large number found also in Europe. This fact would seem to indicate that these islands were long ago united to Europe by a land connection, while they appear to have always remained separate from Africa.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

Started Up.—Alpine *Chronicle*, April 20: Two amalgamators for the Tarshieh Mill arrived on Wednesday'e etage, and on Thursday the mill and furnaces were started up.

Pioneer Mill.—This mill, at Markleville, is to be removed to Hope Valley, where it will he erected for the use of the Barnes' mine.

AMADOR COUNTY.

Specimen.—Jackson *Dispatch*, April 27: A Co. who have been engaged in working a placer claim on the south fork of Jackson Creek, were rewarded, last Friday, by finding a piece of quartz weighing a little over 8 lbe, and valued at from $500 to $1,000.

CALAVERAS COUNTY.

Sceiffebd's Claim.—San Andreas *Citizen*, April 27: Mr. Sceifferd is taking out ore preparatory to having it crusbed at Lloyd's mill.

Capitol.—This Co. are dowu 35 or 40 ft. Tbey bave a well defined vein, which widens as they go down.

EL DORADO COUNTY.

Rich.—Placerville *Democrat*, April 27: The Pocahontas Co. at Logtown, have struck a richer deposit than ever before found in the mine.

LOS ANGELES COUNTY.

San Gabriel.—Los Angeles *News*, April 20: The Roberts Co. is the only one at present working, being engaged in hydraulicing a bank at least 500 ft above the level of the river. Four men are at work prospecting new ground. The first clean-up was $300 from an 8 day's run.

The Ferguson Co. have 15 men cutting their ditch, 2 miles of it being already completed. There still remains another two miles unfinished. Kaley & Co. are also engaged in ditcb-making. The Patterson & Hawley claim is in the bed of the river, where preparations are going on to commence sinking.

NEVADA COUNTY.

Dead Man's Flat.—Nevada *Transcript*, April 23: The ehaft on Hunt & Talhot'e ground is being timbered and pumped out, and will soon be in working order again.

Tbe Constitution claims tunnel work will soon be commenced.

Idaho Mine.—Tbere is enough ore in sight for 3 years' work, and the mine is paying better tban at any time since it was opened.

Locations.—Sisson, Wallace & Co. have located all the waters of Martis' Creek and its tributaries.

F. E. Baker and others have located 1,500 ft of miuing ground, at Blue Tent, Nevada Township.

Buchanan.—The mine is on Big Deer Creek, about 3 miles east of this city. The tunnel is in 300 ft, and the ledge is opened to the depth of 100 ft. It is about 20 incbes wide, and the rock pays steadily from $25 to $30 per ton.

Sweetland.—Tbe Sweetland Creek G. M. Co. are employing 45 men night and day, and using 750 inches of water. They clean up every 6 weeks an average of $30,000. The Creek claims, owned by the same Co., clean up from $2,500 to $3,000 at every run of 6 weeks.

The Buckeye Co. are running a tunnel 2,200 ft in length to reach the bottom gravel, 900 ft beiug completed, and expect to bave it finished by next fall.

Tbe Manzanita Co. are running off top dirt, whicb is paying well. They are also engaged in running a tunnel to reach the pay gravel.

The American Co., on Manzanita Hill, are runuing nigbt and day, and using about 1,100 inches of water. They olean up every 2 or 3 weeks from $9,000 to $12,000. Thie Co. is also running a tunnel to get in lower to reach the gravel.

Banks, Dennigen & Co., on the same Hill, are takiug out considerable gold.

The Yuba Co. have just started iu witb very bright prospects.

Relief Hill.—Nearly all the Co's are at work. The Eagle Co. is engaged in drifting, working 8 men, and clean up every 30 days. The laet run they made yielded them at the rate of $47 to the hand, or in the aggregate of over $11,000 for the 30 days' run. Tbe Waukeshaw Co. are progressing finely in their hydraulic claim. The Union and Eureka Co's are workiug a large uumber of men, and their prospects of large clean-ups are good.

Brioks.—Grass Valley *Union*, April 23: At Findley'e place last evening might have heen eeen 2 gold bricks from tbe Idaho mine, valued at $15,000, out of a 15 etamp mill, run for 2 weeks.

Rich Strike.—Tbe steam machinery of the Knight of Malta has been in operation for eeveral days, and Thursday night the water was taken out of the shaft. Yesterday morning the miners in sinking on the ledge found the most beautiful rock, filled with free gold and sulphurets. The ledge has fine walls and is from 2 to 3 ft thick in the shaft.

PLACER COUNTY.

Rich Strike.—Auburn *Herald*, April 27: Mr. Moran bas opened a quartz ledge in bis field, some 9 ft. deep. It showed gold at the top, and at the above depth revealed very ricb rock. Tbe ledge is about 18 incbes wide.

SAN DIEGO COUNTY.

Bullion.—San Diego *Union*, April 18: There was ehipped yeeterday, to S. F., bullion amounting to $5,875.

Jullian Mines.—The ore of tbe Owens lead, at the depth of 100 ft., regarded as low grade rock is proving itself to be $75 ore. The ledge is fully 5 ft. wide. The proprietors of the Stonewall lead recently purchased a 60-horse power engine, and intend to add 5 etamps to their mill. The other leads, unmentioned, are all being vigorously worked.

Shipped.—San Diego *Bulletin*, April 20: There was shipped yesterday, bullion valued at $1,585.

Work is about being resumed in the Good Hope mine. This ledge is about 100 yards north of the Owens. Tbe shaft is now 74 ft. deep.

SIERRA COUNTY.

Bald Mountain.—Downieville *Messenger*, April 20: The Bald Mountain Co., Forest City have reached the shaft witb their tunnel, and will soon be taking out pay.

Brandy City.—Nevada *Transcript*, April 25: Last season Marks & Co., of Moore's Flat, purchased a gravel claim and two ditches, known as the Brandy City claime, for $72,000. Sixty days after commencement of work, this Co. cleaned up $32,200.

SISKIYOU.

Black Bear.—Yreka *Union*, April 20: In the lower level—eomething over 400 ft. from tbe surface—the ledge ie from 22 to 24 ft. in thickness. The rock is of excellent quality.

Quartz on Humbug.—Last Friday, Mr. Lash made his final clean-up of the batteries and blankets of the Eliza, prior to turning the property over to the new purcbasers and the yield was a trifle over $16 per ton At the Brown Bear, Clark & Cornish are sinking upon the ledge and find it widening as they deecend.

TRINITY COUNTY

New Diggings.—Weaverville *Journal*, April 20; S. McGillivray intends to take a portion of the water from bis Cañon Creek ditch to the large red flat, back of tbe Buther place supposed to be very rich.

TUOLUMNE COUNTY.

Sonora *Independent*, April 27: New Start.—The Patterson Quartz mino, near Tuttletown, is to be reopened immediately.

Orcutt Mine.—The mine, at Jacksonville, has struck a very rich stratum of rock, which prospects all tbrougb it at tbe rate of $42 per ton.

Chispa.—Capt. Turner, picked up on Tuesday last, on bis ranch out of a pile of tailings, a piece of gold weighing 10 ozs., and $12.

Lennon & Waoner Mine.—Tbeee gentlemen are down upon their vein 50 ft., at which depth it is 10 inches wide, and averages $35 per ton with flattering prospects.—Within the last few days they have taken ont $500.

Strike.—Wright & Orcutt, Jacksonville, inform us that they bave struck a rich deposit of gold-bearing gravel in their neighhorhood.

Republican Quartz Mine.—The owners of the Republican mine have a vein 13 inches thick, paying on the average, $40 per ton.

Another Lead.—The workmen in Hughes' Tunnel, Jeffersonville, having left the old lead, are driving a side tunnel to tap a lead in anotber direction.

YUBA COUNTY.

Brown's Valley Mines.—Marysville *Appeal*, April 27: The Brown's valley quartz mines, including the Pennsylvania, Donnebrook, and other veins or lodee, have heen purchased by S. F. capitalists who propose to proceed immediately to re-open and work them vigoronsly.

Sucker Flat.—G. V. *Union*, April 24: At the the Blue Point, the tunnel througb wbich their flume runs ie 2,100 ft. long. Iu tbat hole over $200,000 have heen taken out. There tunnel ie 40 ft. below tbe bedrock.

At the Blue Gravel work is heing prosecuted with vigor. The miners started to run an iucline Monday to tap their tunnel. They clean up, on an average, from $60,000 to $70,000 in a run of 40 days. They have started a tunuel which is to be 3,000 ft long to wash tbe blue gravel tbat lies between tbe cement and bed rock.

Tbe Enterpriee has not began to wash yet as their tunnel is not through. They have about 520 ft. yet to run before it is completed.

The Smartsville claim have run into the bill so far that they now bave a 175 ft. bank. Tbey have a 250 ft pressure to wash their dirt.

Nevada.

EUREKA DISTRICT.

Antelope Dist.—Eureka *Sentinel*, April 21: There are about 20 men there, and the principal discovered ledge ie the "Merimac," tbe rock from whicb is worth $150 per ton.

New Discovery.—From immediately south of the Jackson Co.'s furnaces is a hill lately named "Coy Hill," ou whicb some fine locations have been made recently. Assaying well.

Robinson Dist.—The Canton M. Co. bas extensive interests in this Dist., whicb will be worked during the coming summer.

New York Canon.—The Golden Gate has a sbaft down over a 100 ft., and drifting from the eecond body of ore is progressing rapidly. The Fourth of July is driving matters, and immense quantities of high grade ore are being brought out. The Oromoso has a fine body of high grade ore in sigbt at only 20 ft. from the surface. The Morris is looking well in the incline at a depth of 15 ft. The Hannah has an incline from the hoisting shaft, with ore the whole widtb of the drift for 30 ft. in length.

ELY DISTRICT.

Pacific Tunnel No. 2.—Ely *Record*, April 21: Tbe length is 700 ft., running in a direct line for tbe American Flag mine. At 346 ft. a cnt was run about 12 ft. in a nortbwest direction, and a very large vein of pay ore was struck. From the dip it is suppoeed to be tbe Vermillion lead. At 480 ft. another vein was struck of about the same character ae the first. The face of the tunuel, from late surveys, was found to be 280 ft. from the surface. One hundred and eighty ft. more will be run to strike tbe American Flag ledge; thence through Spring Mound, tapping all the great mines in Pioche at an immense depth.

Ward Beecher—Has beeu sunk 240 ft. with rich results. At 210 ft. a drift was run west about 20 ft., which opened up a magnificent body of ore; the average assay being $107 to the ton. On Thursday at 240 ft., an immense body, covering the entire bottom of the shaft.

Phenix.—This claim, on Panaca Flat, is looking exceedingly well. The sbaft has heen sunk over 200 ft., and on Wednesday last a body of ore 2 feet in width was struck, assays from whicb give a return of $100 to $500.

Page & Panaca.—Work ie heing carried on vigorously. The main shaft is down about 200 ft., and 33 ft. below the first etation. At 260 ft. a new station will be opened. 3 ehifts are sinking tbe shaft.

Condor.—Work will be ehortly resumed with a full force of men. The ehaft is down about 90 ft.; a ledge of 4 ft. in width has been opened up, and sbows well. They have ahont 30 tons of good ore on the dump.

Maggie.—Tbis shaft is 120 ft. deep. About 2 ft. of pay ore has been discovered within the last 2 weeks. The mine is on Spring Mound just above the Creole sbaft of the Raymond & Ely.

Vulture.—This mine, near tbe Bowery, has shown ore 4 ft. in widtb, and assays run from $100 to $150 per ton. A shaft has heen eunk 30 ft., and chlorides are said to he plentiful at tbe bottom.

Kingston.—Tbe shaft is 190 ft. deep with very favorahle indications. Work is being pushed vigorously.

Bowery.—Down 190 ft., and drifting for the ledge. Shipping ahout 10 tons of ore to mill daily, wbich mills an average of $250 per ton.

HUMBOLDT.

Genacca's Mill.—Humboldt *Register*, April 20: It is expected to he turning out hullion by the first of July.

Dun Glen.—Cor. same: The Lang Syne mill will start up on Monday with a new trip-hammer battery.

A large body of rich ore has been struck in the mine within the last few days.

Work continues eteadily in tbe Tallulab tnnnel, with strong indication of a ledge. In the main shaft the ledge is 5 ft. wide, and looking finely.

Davey and Nelson are pushing work on their mine. Ahout 50 tons of shipping ore on the dump.

Bullion.—Unionville *Silver State*, April 27: Amount ehipped from the Arizona since our last issue, was $5,523.

Alpha Ore.—The English mill, at Reno, is running to its full capacity, day and nigbt, mostly on ore from the Co.'s mine in Echo Dist.—the Alpha. The ore mills $75 per ton.

Argentura Dist.—Work is being prosecuted vigorously on the recently discovered mines in Argentura Diet.

REESE RIVER.

Pacific Co. (Limited).—Reese River *Reveille*. April 20: In the Lane & Fuller shaft a cross cut is being run at the 550 ft. level, and a small quantity of high grade ore extracted from the ledge. At the 400-ft. level the pay streak ie exteneive, varying in widtb from 6 inches to 2 ft. in the 2 ledgee being worked. In the Buel North Star at the 500 ft. level, tbe ledge is stripped longitudinally for 200 ft., sbowing a face of ore the entire length, the width of the ledge averagiug from 1 to 3 ft. Working 54 men.

Grove Tunnel.—Tbis mine is let out in contracts to various parties. Now in ore house, about 40 tons high grade ore, belonging to various lessees. Total number of men working, 22.

Moroan & Muncey.—At bottom of 400-ft. level, tbe ledge is of an average size of 12 inches. Hoisting good ore and piling in ore honse.

Saybrook will shortly commence deepening shaft 150 ft. Now working in 110 ft. level, and getting ore of average grade. Working 8 men.

Esther.—Running a cross cut for the ledge at the 200 ft. level, and clearing out drift preparatory to taking out ore.

Diana.—Running 5 prospecting drifts on ledge at different levele, lowest 300 ft. Getting out ore in the 120 and 150 ft. levels. Shipping ore to Mauhattan mill and Wren's Concentrator. Working 15 men.

Isabella.—Getting rich rock in tbe lower level. Working 20 men.

Manhattan Shaft.—Leased to various parties. Working 35 men, 100 tons ore on dump.

Florida.—Getting out ore averaging $350 per ton, shipping to Manhattan Mill. About 10 tons on tbe dump. Working 12 men.

Clark & Co.—Getting out very high grade ore and shipping to Manhattan.

Ku Klux, a fiue body of ore has receutly heen struck in this mine, in a ledge of an average width of 2 ft., coutaining eome base hut averaging high in eilver.

Mills—Manhattan.—Running steadily on custom ore, and ore from the Co.'s mine.

Wren's Concentrator. — Running steadily on ore purchased from varioue dumps, and on small lots from Diana, Martincau and Grove Tunnel.

Metacom will start up as soon as the price of wood will admit.

Yankee Blade Dist—Ension.—During the week past 19 tons, of an estimated value of $150 per ton, has heen ehipped to Manhattan mill, and 1½ tons which assayed $1,000 per ton, Working 3 men.

Kling & Kelly.—Shaft down 150 ft. Average width of ledge 2 ft. Sbipping ore to Manhattan, varying by assay from $100 to $350 per ton. Working 20 men.

New York Canon—Chase.—Tunnel in 600 ft. Ledge from 1 ft. to 18 inches in width. On dumps, 30 tons of ore. Working 2 men.

Morris & Cable.—Width of ledge from 6 to 18 inchee, 15 tons of high grade ore on dump. Working 4 men.

Gold Mt. and Lida Valley.—There are at Gold Mountain about 30 men and at Lida Valley about 20, who are engaged in prospecting the ledges already discovered. In a tunnel run by B. F. Higgs, at Gold Mountain, water sufficient for domestic purposes has heen struck. The formation at Gold Mountain is sienitic granite and porphry, and the ore is in the form of sulphurets and chlorides of silver, and sulphuret and free gold. About 7 miles from Gold Monntain are several ledges carrying carhonate ores suitable for smelting. The principal mines are the Boreuo, Shaw and Nova Zembla on which shafte have been sunk.

Murphy Mine.—Since the 15tb of Feh. about 300 tons of ore have been taken from the mine which averaged $125 per ton. The ledge is 20 ft. in thickness in wbich are 2 veins of pay ore, one 5 ft. and the otber from 6 inches to 2 ft. in width. The Co. own in connection with tbe mine,

a 20-stamp mill. About 60 men are employed in and about the mine and mill.

WASHOE.

SUTRO TUNNEL.—Virginia *Enterprise*, April 21: The tunnel was yesterday in 2,840 ft.

ALASKA CON. M. Co.—The Co. is in the Colemnn M. Dist., 6 or 7 miles aonth of the Daney mine. Considerable work is being done on this claim, and the ore being taken ont has all the appearance of Comatock ore. The center ledge is 61 ft. wide, the west ledge 24 ft. (and the east ledge 30 ft. A force of men are thoroughly prospecting the mine, and sinking shafts and running tunnels.

NEW UTAH SHAFT.—The new shaft will be about the center of the claim and 600 feet east of the old shaft. Work will be commenced to-day on the new shaft, which will cut the lead at n depth of about 600 ft.

MCMEANS.—A shaft is sunk 100 ft. deep and a tunnel 600 ft. in length is run.

OVERMAN.—The 1,000 ft. station is opened and a drift level for the ledge from that point will be commenced soon.

PICTOU.—Shaft 155 ft. deep, with an incline of 70 ft. deeper on the lodge. Tunnel 550 ft. with 100 ft. further to go to cut the ledge.

BALTIMORE. — The machinery of the Uncle Sam hoisting works, purchased by the Baltimore Co., is being removed to the new shaft of the Co.

YELLOW JACKET.—Incline down 110 ft. below the lowest working level, following the slope of the incline. A new station will be opened at the 1,540 ft. level, when it is reached. Daily yield of the mine, 50 tons.

CROWN POINT.—Daily yield 425 tons, from the 1100 and 1200 ft. levels, milling on the average $70 per ton. There is no particular change to note in the mine. It is simply immense, with no limit to its richness or quantity of ore contained.

CHOLLAR-POTOSI.—Daily yield 150 tons from the Belvidere, Blue Wing and other old ore sections. Prospecting in the various parts of the mine vigorously carried on.

SIERRA NEVADA.—Daily yield 50 tons from the new ore vein in the lower levels. This vein is looking finely and a raise is being made to facilitate its working higher up

SUCCOR.—Only enough ore is taken out to keep the Co.'s mill running. The new shaft is sunk.

CON. VIRGINIA.—Prospecting vigorously at the 500 ft. level.

GLOBE.—Some very good ore is found in the old upper workings, which is being shipped to mill;

GOULD & CURRY.—Drifting north at the lower level, and sinking tho incline.

CALEDONIA.—Engaged in retimbering the shaft.

WHITE PINE.

NORTH AURORA.—White Pine *News*, April 20: The ore in the Risdalo chamber continues to hold up in quantity and grade. The ore body in the South chamber is cut through to the hanging wall, and drifts are pushed ahead east, west, and south, for the purpose of stoping out to advantage.

EAST SHEBOYGAN.—In the ore chamber a great part of the ore is of a high grade. The ore in the west cross-cut has improved since last reported. Work was recommenced on the Exchange drift this week.

MAMMOTH.—The ledge in shaft No. 12 shows a width of 8 ft., pitching to the northwest at an angle of 70 deg. There is a force of 5 men at work.

CON. SILVER WEDGE.—Work was resumed since last report. A drift was started to run from the 130-ft. level east. There is a body of quartz 2 ft. thick in the face of the drift.

SOUTH SHEBOYGAN.—The drift running to cut the ledge is in 67 ft.

NOONDAY.—There is 250 tons of ore on the dump.

WARD BEECHER.—Sinking winze from the bottom of Phillpotts chamber to East drift from Lady's chamber.

BEECHER CONS.—The mines and mills will start up about the middle of next month.

SILVER WAVE.—Breasting out in Boswell shaft. Hoisting and piling ore on the dump. Work in the Perkins shaft is going ahead on contract.

EBERHARDT. — A force is employed breasting out south of the old Keystone workings.

SILVER OWL.—Running an incline from the limestone foot-wall, and good indications. Also sinking a vertical shaft 200 ft. back to cut the ledge.

TRENCH.—The tunnel running to cut the ledge broke through the foot-wall yesterday, and found rich ore assaying from $60 to $1,000 per ton. The width of the ledge has not yet been ascertained.

Arizona.

MINES AND MINING.—Prescott *Miner*, April 13th: A new working shaft has been started on the Tiger. The furnaces at Wallapai and the mill near Ehrenberg are almost ready for operation.

PINAL MINES.—San Diego *Union*, April 18th: The work of developing the newly discovered silver mines in the Pinal mountains was going on nicely until the Apaches made a descent on the miners, stealing all their horses and mules. The lowest of the assays shows the poorest of the ore to contain $48 silver, to the ton, and the other assays have given us high as $10,000 per ton.

Colorado.

SHIPMENTS.—Georgetown *Miner*, April 13th: Bailey & Nott shipped during last week fifteen tons of ore.

Since our last report, G. W. Hall & Co. have sent off 95,000 lbs of ore.

Wm. Bement has purchased 70 tons. Shipped 60. Is making up a car of high grade for shipment to Europe.

CARIBOU.—Caribou *Post*, April 20th: In the Caribon mine the vein-ore of rich sulphurets is 1½ ft. thick. Workings for March, on one portion, paid a net profit equal to the interest, at the rate of six per cent. per annum, on $30,000,000, provided tho whole mine had been developed and worked with the same success that the part opened was worked during the past month.

The Caribou mill is working 16 to 18 tons of ore each day. A recent important addition to the works is a cupel furnace for refining the bullion.

The Silver Point, Idaho Hill, opened to the depth of 60 ft., has a wide crevice filled with rich ore. A sample lot assayed, in silver, at the rate of $2,600 per ton. The owners have a large amount of ore on the dump. The Seven-Thirty and many other mines are doing remarkably well.

The new mining camp of Williamsburg is 5 miles north from this place, and includes the Washington mine.

CLEAR CREEK CO.—Central *Reporter*, April 17th; on the Queen lode three claims are being worked, that are yielding a very fair grade of ore. On the discovery, Hall, Queen & Co. have a shaft 115 ft. in depth, the ore in the bottom averaging 10 inches in width. The first grade ore is worth for smelting purposes from $50 to $300 per ton. Claim No. 2 west is being worked by the Dagenais Bros. Their shaft—60 ft. in depth—carries a vein of first-class ore from 4 to 6 inches in width. No. 3 west, Lacaille & Co. have leased. At 110 ft. in depth they are drifting east on a fine vein of ore that averages about 10 inches in width.

BENNETT & CO., on the Kent Co. lode, at 150 ft., have a crevice 25 ft. between walls, with 6 ft. of pay-ore that runs a trifle over 6 ozs. to the ton.

Mr. Joseph Harper's mine is on the California, 425 ft. in depth, looking excellently well, carrying a rich crevice of ore in the shaft, and in the drift running west the crevice is four ft. between walls, of rich milling and smelting ore.

Lower California.

SAN RAFAEL.—San Diego *Union*, April 18th: Two new ledges have been discovered which are pronounced superior in richness to any yet opened.

Montana.

HIGHLAND.—Deer Lodge *New North-West*, April 13: Five men have been at work on the Nevins lode all winter. They are down about 250 ft., and have a well-defined crevice 4 to 5 ft. in width, and very rich. The Nevins Co. have 5 overshot wheels and 11 arastras, and expect to crush a great deal of ore this season.

UPPER TEN-MILE.—Helena *Gazette*, April 15th: Peterson & Co. have had a good force drifting in the har all winter, and washing the dirt with good results. They are running two breasts, day and night.

Monitor Gulch will be extensively worked again this season. Four hydraulics were run last year.

WORKING.—Helena *Herald*, April 13: At the Silver Reduction Works, Jefferson Dist., a continuous stream of bullion is flowing from the furnace, which assays $1,500 to the ton.

BEARTOWN.—Dear Lodge *Independent*, April 20th: Snider, Reimer & Co. are constructing a ditch from a point half a mile below town to a har two miles below.

McDonald & Clegg intend opening new mines in Phelan gulch, half a mile below the old diggings.

Oregon.

GOOSE LAKE.—Q. A. Brooks informs the *Statesman* that the placer mines lately discovered in Quartz Valley, between Link River and Goose Lake, are creating considerable excitement throughout all Southern Oregon.

Utah.

TUNNELS.—Salt Lake *Tribune*, April 20: Work is being prosecuted on the Howland and Etna tunnels, and Little Cottonwood, with much vigor. It is the intention of the Co. to work all the hands that can be profitably employed. As soon as the snow melts a number of shafts will be sunk on the line of the Howland tunnel.

RUNNING.—The Badger State Smelting Works, 4 miles south of the city, have turned out 8 tons of bullion in the last 2 days.

The Winnamuck, or Daggett & Bristol's Furnace, at Bingham Canon, is also in successful operation.

RUSTIC.—Cor. same: The smelters are to resume work soon. The Enreka Co. are putting up their 12 stamp mill at Homansville. Woodmansee's Sunbeam is showing 2 splendid veins. L. J. Whitney has purchased more Sunbeam, and has commenced operations with flattering prospects. The S. L. M. Co. are tunneling Argenta Hill with considerable success.

Jno. Bently, Sup't of an Omaha Co., has arrived and commenced work on the Co's mines, all near Diamond City. The Saratoga and Mary Cleveland are showing up splendidly.

The O. K. Co. will resume operations about the 1st of May.

The Swansea is being vigorously worked and is turning out and shipping more than ever. The Mammoth is working 40 men and can hardly procure transportation for the first-class ore. C. Crimson & Co. are tunnelling for the Mammoth north from Mr. Meader. He expects to strike the ledge in a few days.

The Eureka Co. have about 10,000 tons of milling ore on their dumps. Robbins & Lance continue to take out splendid ore from their Mono and Left Bower. They are taking out some fine ore from the Red Bird lode.

McMasters, Mathews, Foley, Green, Brooks & Martin, Pointer, Sterling and Jackman & Sons, are successfully working their claims at and near Diamond City. Quite an extensive vein of galena has recently been struck in the Austin lode.

Fresh discoveries of rich horn silver rock have recently been made on Eureka Hill, and the Eureka Company have taken a quantity of splendid silver ore from their Beck shaft.

The mines near Silver and Diamond cities are steadily looming up.

EAST RUSTIC.—Cor. same: The Alice is down 90 ft, as a fine ore streak of 3 ft 6 inches and a 6 ft 8 inches vein. The ore is good and improves the further it is followed. There was at least 40 tons of good ore on the dump. The work on this shaft is progressing rapidly. The Washington is another promising lead; it is down 100 ft and has at least 100 tons of ore on the dump. Any assay made from the promiscuous pile will go $100 to the ton. The Benton is an excellent lead. The Morning Glory is producing some splendid ore and has a large quantity on the dump. The Silver Pride of Diamond is doing well. Two shafts are down 100 ft each. They are drifting and getting out some very rich mill ore. The Bowers is at work with every prospect of being pushed ahead. Drifts are to be run and, if that fails, a further depth will be sunk.

The Silver Star is a well defined lead, the shaft is down about 75 ft. It has about 3 ft of ore which will assay as high as $500 per ton.

S. F. Stock and Exchange Board.

THURSDAY, MAY 2.

Sales at the Stock Board were larger for the week ending Wednesday, the 24th ult., than at any previous week since the Board was formed. The sum total was $11,203,000. The Raymond & Ely mine sent down up to the 26th ult., $284,854 for April; $32,000 was produced for the three days previous to the 29th. The Mahogany sent down $5,000 last week. The Board adjourned from over Saturday to attend the funeral of N. E. Grimes, formerly a member. The Trustees of the Dauphin M. Co. have elected the following officers: S. D. Krieder, President; R. C. Singer, Superintendent; and C. F. Balcolm, Secretary and Treasurer. The propositions before the Board to secure a larger room, abolish street sales, etc., will be seen by reference to another column.

The meeting called by the Senator M. Co., for the 31st of May, is to consider a proposition to increase the capital stock from $600,000 in 6,000 shares, to $2,400,000, in 24,000 shares. The Hartford M. Co. will hold a meeting on May 28th, with a view of increasing their stock from $280,000 in 400 shares, to $3,500,000 in 3,500 shares. The Imperial propose on May 29th, to increase their stock from $2,000,000 in 4,000 shares to $4,000,000 in 40,000 shares. The Gold Cañon Consolidated Co. will take into consideration on May 31st a proposition to increase their capital from $700,000 in 3,500 shares, to $3,000,000 in 35,000 shares. The Consolidated Virginia propose on May 20th to increase their capital stock to $7,080,000 in 23,600 shares. The Belcher Co. propose on May 24th, to increase their stock from $1,040,000 in 10,400 shares, to $10,400,000 in 104,000 shares. The Hale & Norcross, on the 30th of May, propose increasing their stock from $3,200,000 in 16,000 shares, to $9,600,000 in 48,000 shares.

There was only one session of the Board last Thursday, when a large business was done at advancing prices, and Belcher, Crown Point and Hale & Norcross brought heavier prices than ever before. On Friday, Belcher sold for $1,600, equal to $19,200,000 for the whole mine. Monday, stocks were still advancing. Tuesday, for the first time in a long time, the market was irregular and weak, some descriptions falling and some advancing. Wednesday, the market was decidedly weak, and everything showed a decline, varying in high priced descriptions from $20 to $80, and on low priced kinds from $1 to $15. To-day, however, the market recovered somewhat from Wednesday's depression, and Crown Point sold at $1,600 regular, and $1,700, buyer 30, the higest figures ever paid.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Scientific Press, S. F.

Illinois Industrial University.

We present in this number a cut of the principal building of the above institution. This University, located at Urbana, Champaign County, Illinois, was founded under a law of Congress, and is under the control and patronage of the State. It has quite a liberal endowment, and is economically developed to the full capacity of its current income; besides, the State has aided it by appropriations, and the county in which it is located, by donations. It was opened for the admission of students four years ago. There were seventy-seven students the first term, and the number has steadily increased, until in the present year three hundred and seventy-five students are in attendance. Women were admitted to the University in the autumn of 1870, and there have been during this year some forty-three in attendanee.

The University is divided into five Colleges, each of which comprises one or more Schools.

College of Agriculture.

This contains the School of Agriculture aud the School of Horticulture. This College aims to carry out one of the leading ideas of the law of endowment, to teach all the atudies relating to these arts. There are 600 acres of fine farming land under this department, well stocked, and in a fine condition to practically illustrate all the truths learned in the class room. This College deservedly takes first rank in the University, both for its importance aud completeness of work.

College of Engineering.

Thia comprises Schools of Mechanical Engineering, of Civil Engineering, of Mining Engineering, and of Architectural Engineering. The School of Mechanical Engineering takes the lead in this College. The instruction, while severely scientific, is also severely practical, and aims at a thorough understanding and mastery of all the mechanical principles and devices. Shop practice is required as a regular study of the course; and for this purpose a building 128 feet loug and 80 feet wide, has been erected and furnished with a full set of the best machinery. Over $30,000 has been carefully expended to develop the practical side of this school, and the University is prepared to give, and probably does give at present, better instruction in Mechanical Engineering than any other University in this country.

Although the School of Mechanical Engineering oecupies the first place in this College, the other Schools are by no meane neglected, but are at once thoroughly practical and scientifie.

College of Chemistry.

This College aims to fit men for all callings where this science is needed: Chemists, Pharmaceutists and Metallurgists; also in its application to the arts of electrotyping, photography, ete. The College has a laboratory well fitted up, and about $8,000 worth of apparatus and furniture.

College of Natural History.

The aim of this department is to fit persons for Practical Geologists, Collectors and Curators of Cabinets and Musenms, and for superintending scientific explorations and surveys.

College of Literature, Scicnce and Art.

This College embraces Schools in the different Languagee, in Commerce, and in Military Science. The course in this College is quite similar to the classical course in any full college.

Features of the University.

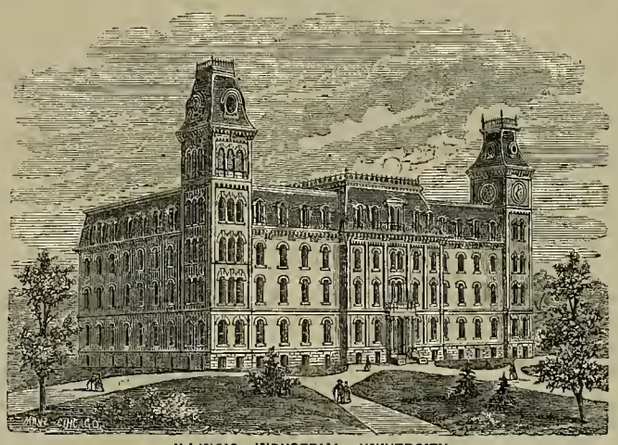
The University asks no fee for tuition, the only payments required after matriculation are the incidental feee of $2.50 each term.

The law establishing the institution requires that all male students shall have military drill; and to aid in this, a fine drill hall was built having a clear floor 60 by 125 feet. This room is large enough to permit two companiea to maneuver in conjunction. The qualifications required for admission arc: first, a good understanding of all the branches of learning taught in the common schools. Students possessing the qualifications required are admitted from any State or country; and perfect liberty in the choice of studies is permitted unless it seriously interferee with the general good.

One admirable feature of this institution is that, in all matters of order and decency, the students govern themselves, having a thoroughly organized and successfully working government for that purpose.

Among the features of the University that are most attractive to the visitor, and of great value to the etudent, are a library of nearly 8,000 volumes, open from 7 A. M. to 9 P. M. every school day; a museum of Natural History, and one of mechanics; a large green house well stocked with choice plants; and the large ornamental grounds rapidly growing into great beauty.

The cut given is of a new building not yet finished but to be ready for use at the opening of the next University year in September. This fine building has a front of 214 feet and two wings, oue at each end, of 120 feet in length by 60 in width. All the rooms are public, none being used for dormitory purposes. The cost of the building is $150,000.



ILLINOIS INDUSTRIAL UNIVERSITY.

The building now occupied is of five stories 124 by 40 feet with wing 70 by 45 feet. This will be given up to dormitory and boarding uses on the completion of the new building.

All communications addressed to the Illinois Industrial University, Urbana, Illinois, will receive prompt attention.

Social Peculiarities of Alaska.—Alaska has social wonders as well as other phenomena, which are not as those of other lands. A gentleman who haa recently returned from Sitka, says that the week before he left he witnessed a carnival such as could not be seen in any other part of the United States. The entire population marched in procession on the opening day, and during the remainder of the week no person appeared on the street unmasked. In every house jollity and good cheer prevailed, and Russian and Siwash, American and Tenton, indulged in masked balls each evening. This week is kept as a carnival week each year by the Russians, and they indulge in amusments to their heart's content. Notwithstanding the excitement, there were no quarrels or disorderly conduct apparent.

Extensive beds of peat, said to be fully equal in quality to the best Eastern article, have been discovered in the lowlands lying along the line of the Los Angeles and San Pedro Railroad, commencing at a point about ten miles below Los Angeles, and exteuding to the sea-shore. Pits have been snnk in different places along the liue of the railroad, and the deposit found to improve in quality with depth. The first delivery of peat in this country was made on the Los Bolas rauch, near Auaheim, a few weeks ago.

Artesian well-borers have been unnsually successful iu this viciuity since the earthquake.

The Hyde Steam Plow.

We had well nigh lost sight of this invention, since the resnlts of its operations in the tule lands in Sutter County, last fall, until we were once more reminded of its existence hy a notice in the Sacramento *Union* detailing the result of another successful trial, a few days since at Odbert's ranch, near Brighton, where some sixteen acres were most thoroughly plowed—broken up and pulverized. We have since been informed that after the first rains, last fall, the plow was taken to Sacramento, and two wheels put on as steering wheels, instead of one, and the driving wheels each made 30 inches wide, instead of 15 inches, as they formerly were. It waa found that the machine sunk too deep in the ground; hence the necessity of these improvements. The main principles of the plowing arrangement have been found to be correct both in tule ground and in the hard brick clay ground, in both of which it has operated, turning up the soil into a light body, that the foot sinks into as on a sponge.

The operation is entirely different from ordinary plowing, which leaves the land in a long furrow. The Hyde steam plow leaves it in short spiral furrows, angular to the line of movement—the same as putting a spade into the ground and tnrning it up half over as it is taken out, cultivating and lightening up the grouud most thoroughly. We are informed that the Hyde plow, when compared with the published results of steam culture in England, does its work with loss expenditure of steam aud fuel. Though the successful accomplishment of this hard, solid fact has cost the Messrs Hyde a considerahle sum of money, yet the importance of it to this country, and in fact to all prairie country, is so great that we think they cannot fail to be amply remunerated for this large outlay. We think our large laud holders will do well to give the undertaking their careful consideratiou. Capitalists freqneutly hold back from encouraging new inventiona, on the ground that they are visionary. That objection cau now hardly he urged against thia, as repeated trials and progressive improvements seem to have pretty fully demonstrated the practicability of this machine.

The original cost of the two systems give Hyde's a considerahle percentage of advantage over "the rope traction system" in use in Englaud, to say nothing of the more rapid execution of the work, or the decidedly superior pulverization effected hy the former. The introductiou of a successful steam plow would he one of the greatest benefits which could he bestowed upon Cahfornia at this time, and we sincerely trust that Mr. Hyde may he ahle to accomplish so desirahle an object.

Mineral Product of Germany in 1870.—The total production of coal in Germany in 1870 was 23,000,000 tons, raised hy 107,682 workmen, and representing a value of £6,900,000, at the pit's mouth. Of this quantity 5,850,000 tons were raised in Upper Silesia, 1,570,000 in Lower Silesia, 11,760,000 in Westphalia, 890,000 tons in the Aacheu district, and 2,780,000 in the Saar district. The production of lignite aud hrown coul waa 6,110,000 tons, of a value of £866,000, principally from Prussia and Saxony; iron ore and ironstone, 2,660,000 tons; ziuc ore, 368,000 tons; lead ore, 98,850; manganese ore, 11,200; iron pyrites, 73,800; phosphorite, 25,000; rock salt, 2,000,000 tons. The production was raised at 2,432 works hy 181,770 workmen.

Books introduce us into the hest society; they hring us into the presence of the greatest minds that ever lived.

New Publications.

Fire-Side Science.—A series of Popular Scientific Essays upon subjects connected with every-day life. By James R. Nichols, A. M., M. D., Author of "Chemistry of the Farm and Sea," and Editor of the Boston *Journal of Chemistry*. New York: Hurd & Houghton. Cambridge: Riverside Press.

We have received a copy of the ahove work from Bancroft & Co. The essays coutained in this little volume relate to the science of home life, and the every-day affairs of individuals aud families. The anthor, as editor of the Boston *Journal of Chemistry*, is one of the most successful and instructive writera on popular science in the country. He has a most happy manner of treating ordinarily dry subjects in a way to interest or instruct either the fireside group or those who lahor in the field or shop.

It is one of the most encouraging signs of the times that there is a growing demaud and taste for really valuahle and instructive reading, and he who can render science attractive to the husy working men and women of our country is better than he who taketh a city. The demand of the day is that science should he brought down to the comprehension of the popular mind, and made to minister to the ueeds and pleasures of the people. To do this it must he divorced from the tramels of technology, and made plain and attractive to the common mind. There is uo difficulty in doing this; and he who most successfully leads in this uew path of literature is engaged iu a nohle and most important work for the elevatiou of the masses. Fire-Side Science should find a place in every home in the laud.

Pocket-Book of Mechanics and Engineering, containing memoranda of facts and connection of practice and theory; by John W. Nystrom, C. E.; eleventh edition. Revised and greatly improved with original matter. J. B. Lippincott & Co., Philadelphia.

This work is the result of study and practice accumulated during the author's professional career, and will he found extremely useful and convenieut for engineers in the field. The former editions are familiar to many, who fully appreciate its value. The sources from which the information has heen derived are considered to he the highest and best on the varions subjects discussed. Dalton on air and heat. Regnault on steam. Kopp on the expansion of water. Morin on friction and strength of materials, aud various others of equal authority. The pocket-hook of an engineer hecomes, after a time, like au old friend, always ready wheu wauted; hut to keep up with the advance of the times new works are required, or new editions of old oues already proven true; and iu the latter case it is convenient to have the oue we have been accustomed to, as we can more readily refer to any particular subject. A large amount of original matter has heen introduced in this edition. The work may he procured of A. Runan & Co., No. 11 Montgomery street, in this city.

The Richest of all Gold Fields.

It has only recently been discovered what almost inexhaustible mineral wealth the soil of Eastern Siberia conceals, and that in the district of the River Amoor, Russia, possesses a gold-field which explorers of those parts are inclined to consider the richest in the world.

Gold-washing and gold-digging are going iu the tributaries of the Russo-Chinese frontier streams and their valleys, and repay the persons employed in it so abundantly that laborers earn 50 to 150 roubles in silver per day, and companies of diggers on the Oukalouta find, as a rule, from seven to eight, but in some cases much as eeventy and even one hundred pounds of gold per day.

The river Sega is still more productive, and has yielded to one company one hundred and seventy pounds per day. These two rivers are the richest but by no means the only gold-producing tributaries of the Amoor. Geologists have found that the Tablona from which the river Sega eprings, contains various kinds of mineral treasures—gold, silver, and more especially great masses of iron, which promise in time to secure to Russia an extensive remunerative iron manufacture. To make these treasures available for Western industry, a company has been started at St. Petersburg, working partly with English capitalists, to navigate the Amoor with the river steamer service. The enterprise is uot, however, to be confined to this one subject, for the company hope in course of time to open a profitable trade with China and Japan, and expect later on to command the trade with the Western coast of North America.—*Col. Miner.*

The Goodyear hard rubber patent expires May 6, 1872. The Goodyear eoft rubber patent expired sometime ago.

Useful Information.

Another Scientist on Spiritualism.

The celebrated London lawyer, Ed. W. Cox, who was a witness with Dr. Crookes, of the so-called spiritual manifestations, to which allusion was made, with illustrations, in the Press a few months since, has lately pubbsbed a pamphlet, in which he says he has become fully satisfied that intelligent noises or rappings are actually produced in what are called "spiritual manifestations," and that chairs, tables and other objects are undoubtedly moved, and that the proofs of the reality of these demonstrations are just as absolute as are the proofs of any other class of facts in nature.

The force by which these demonstrations are made, he calls "psychic force," as also denominated by Prof. Crookes. Mr. Cox thinks the fact indicative of the existence of a soul within man, and it is the soul which he thinks may exercise psychic force beyond the body. He rejects the idea that the manifestations are produced by the agency of *disembodied* spirits; and holds that they are purely and wholly the result of forces residing in the human organism. The medium is never able to communicate anything that is not already known to some person present.

This psychic force, Mr. Cox thinks, operates by a vibratory or wave-like action, and is opposed to and capable of overcoming the attraction of gravitation. Tables and other objects that are moved are first filled, so to speak, with the psychic emanation, which renders them buoyant in the air, when they float, swing and sway about as if supported by an invisible balloon.

One of the explanations of these phenomena, and upon which Mr. Cox lays much stress, is *the unconscious cerebral action of the mind of the medium*, which action is manifested through the psychic force. The *Scientific American* in reply to this latter explanation says: "Now as this unconscious cerebral action can be induced and made to set men's bodies in motion, without his knowing it, it becomes a question whether Mr. Cox himself and his friends did not have *their* cerebrums unconsciously excited so that they could hear noises and see sights that in reality never took place; or so that they could not see the person who pushed the piano, lifted the table, or forced down the balance.

The Wonders of Chemistry.—Chemistry insists that charcoal and the diamond are one; that ottar of rose and burning gas count the same atoms in their constitutions; and that the ruby is but iron and clay. In what subtle combination lies the difference between the twins, why C4 H4 should be a stench in the one and a sweetness in the other, or priceless here and common there, star-eyed Science has not yet explained.

And, after all, it is no more mysterious than that "the limb, the thews, the statute, bulk and big assemblance of a man." should make up indifferently a coward or a hero; here Nero and there Paul; here Newton and there Hodge; here Attilla and there Howard.

What spiritual chemistry will ever classify the differences between men in personal power? Faraday and Agassiz come up from the ranks with little help but that of their own wits. Humboldt's only son, heir of wealth and genius, spends most of his life in bed being too lazy to get up. Napoleon the First made an army, and then spun it like a top whither he would. Napoleon the last crumbled an army into a scattering mob, and ran away from it.

Terra Cotta.—The architects have held a convention in Boston, and among other papers read by the members, one on the use of terra cotta in building is especially deserving of notice. This material is burned clay, mixed with pulverized glass, earthenware, or fossil bones. It was used by the Egyptians, and afterwards by the Greeks and Romans, and later still by the architects of the Middle Ages. The Ninevah statues and tables of terra cotta, with written engravings, remain as sharp and clear as ever. Lately the composition has come into general use for fine buildings in Lodon. A solid block, one foot square, will sustain a weight of eight hundred and eighty-five tons without cracking, and its cost is less than that of stone. Some thought terra cotta lacked certain qualities necessary for trustworthy work. It did not shrink evenly in baking, a great deal of time was required for its preparation, and the blocks were necessarily too small.

Curious Fact.—At a recent sitting of the French Academy of sciences, a curious communication was received from M. Zaliwski, which if it were borne out, would be invaluable to navigation. He states that if a hollow cylinder made of thin material, open at the top and provided with a sharp-edged bottom, be properly ballasted and then put into a tub or other vessel filled with water, it will soon move in a never-varying direction from west to east. The round tin boxes in which concentrated milk is preserved will do perfectly for the experiment, which will become more and more perceptible the oftener the same cylinder is made to do duty in that way.—*Engineer.*

To Improve Gilding.—Mix a gill of water with two ounces of purified nitre, one ounce of alum, one ounce of common salt; lay this over gilt articles with a brush, and the color will be much improved.

Lubricators.

In selecting, preparing, and applying lubricators, it is necessary to use the utmost care, and see that the lubricator employed is properly adapted to the purposes for which it is to be used, since that which is the very best lubricator for some purposes may prove to be worthless for others. Thus the very expensive and exceedingly delicate oil used by the watchmaker would be of comparatively little value, if applied to heavy machinery, and we need hardly suggest that the converse is equally true. The conditions which chiefly demand our attention in connection, are—1. The nature of the surface to be lubricated; 2. The pressure employed; 3 The temperature to which the machinery is to be exposed, and 4. The method of applying the lubricating material.

Close-grained, hard surfaces, with a fine finish, require a finer lubricator than the surfaces of the opposite kind. In steel spindles with finely polished foot-bearings, working in hard and smooth steps, the finest oil answers admirably. Cast iron of good quality will bear a coarser oil, while, if very open, it may require a soap. The same is true of wood, whether used endwise or longitudinally. For wooden bearings the finest oil is not nearly as good as coarser oil or tallow, while it is very much more expensive. This circumstance is, however, greatly influenced by the amount of pressure to which the surfaces are exposed. Even steel bearings, exposed to great pressure, demand a harder lubricant than where the pressure is light; and where the surfaces are very soft, and the pressure very great, the only lubricant that can be relied upon is plumbago. Ordinary machines pay very little attention to the relation that should subsist between the lubricating material employed and the temperature at which it is used. In Europe this subject has received the most careful thought, and those who will take the trouble to consult the English engineering pocket-books, will find the most explicit directions as to temperature, given in connection with the receipts for preparing lubricators. The necessity of this becomes obvious when we reflect that temperature regulates in a large measure the hardness or softness of oleaginous lubricators; and this hardness should always be carefully adjusted to the conditions in which they are to be used.—*Handicraft.*

Letter Writing.—In Russia, the number of letters sent in a year is not quite three to 100 inhabitants, while in England the average is twenty to each person. In the United States, the letters average seven to each inhabitant—a trifle over one-third as many as in Great Britain. This is owing to our vicious and burdensome postal system, and not to the lack of intelligence of our people, as might be argued. A good system, adapted to the wants of the country, would soon make the number of letters greater than in England, as we have more people who can read and write. The whole of Europe averages between five and six letters to each person, both Prussia and France averaging more than the United States, and even Spain half as many.

Patent Fuel.—"Take three parts of the best Newcastle coal, beaten small, one part of loame, mix these well together into a masse with water, make thereof balls, which you must dry very well. This fire is durable, sweet, not offensive by reason of the smoke or cinder as other coal fires are, beautiful in shape, and not so costly as other fire, burns as well in a chamber even as charcoal." The foregoing extract, taken from a fragment of an old book supposed to have been printed about the year 1670 or 1679, and headed, "An Excellent Invention to Make a Fire," contains probably the earliest reference on record to the manufacture of what is now commonly known as patent artificial fuel.

Too Much Legislation.—There is a law in Massachusetts, providing for the inspection of fish, in which all packages of fish are restricted to a weight of 200 pounds. A capitalist of Boston desired to construct tanks in platform cars, and to send them to San Francisco filled with mackerel, bringing them back filled with salmon which are so abundant on the western coast. As the "packages" in this case, however, would weigh two thousand pounds, the enterprise would be illegal, and it was abandoned. State fish inspectors, in the mean time, are making about $4,000 a year.

A Paint for Smoke Stacks.—A correspondent of the *Scientific American* gives the following: One pint of good varnish, one pint boiled oil, and red lead sufficient to produce a proper consistency. Prepare it a few hours before wanted, and repeatedly stir while using. Use no turpentine or dryers. I have a stack thus painted which has stood the weather and heat for two years, and remains as when first done, but changing to a darker color. The expense is trifling. This is applicable to any sheet iron which may be subjected to weather or moderate heat.

Durable Work.—One side of a house at Digbton, Mass., has just been reshingled for the first time since the house was built, 77 years ago. A large part of the old shingles are but little worn. They are of Southern cedar, and the nails were all made by hand. The west side of the roof, which is less exposed to storms, will apparently last for many years longer.

One hundred years ago there was only four newspapers printed in America.

Good Health.

Needed Sewing Machine Improvement.

It is quite generally agreed among medical men that the injury to health from operating sewing machines, arises more from the anatomical position which the operator is compelled to assume than from the mere labor of propelling the machine. Operators at sewing machines are obliged to sit with their backs entirely unsupported and the knees elevated, thus keeping the spinal muscles constantly stretched, and inducing pain in the back, which is the most constant effect of work of this kind. This irritation is reflected by sympathy to other parts of the system, and general debility ensues. The *Scientific American* says: "We have never seen any satisfactory reason why the tables of sewing machines which are operated by foot power should not be brought up over the lap, so that the operator might sit leaning slightly backward, with the spine thoroughly supported and the limbs extended. We proposed this once to a leading manufacturer, and were told that the notion that women were injured by working on sewing machines had no foundation in fact. We argued that those who had investigated the subject, though claiming that moderate exercise of this sort would not injure, almost unanimously insisted that excess *would* injure, and added that profitable employment with such machines implied an extent of labor which these authorities claimed to be excessive on machines as at present constructed. We failed, however, to convince him that any improvement in form was desirable or practicable.

Notwithstanding this discouragement, we put our idea to the test of actual trial, and found that all who had been accustomed to work on the old machine, who tried the modified position above described, were unanimous in testifying to the superior comfort and ease secured by it. There may be improvements made in treadles, but these do not reach the root of the evil. It is the position, not the mere labor of propelling the machine, that fatigues the operator.

Those who tried our plan of raising and bringing the table up nearer the person, and placing the treadles farther away, found no difficulty in handling the work or in keeping it properly placed on the table, as the manufacturer above alluded to seemed to apprehend. The whole body was placed in an easy, unconstrained position, and so supported as to rest rather than fatigue the back. We look to see some such change made in the construction of sewing machines. They are so valuable in many departments of industry that invention will not rest till their full utility is developed. The value of an improvement that would enable an operator to work even one hour per day longer than at present, without injurious fatigue, can scarcely be over-estimated."

In-Door Life.—One chief respect in which our severe climate and over-stimulating social condition harass us, is the excessive preponderance of in-door activity which they involve. Now man is not yet an in-door animal, though he seems to be in a fair way to become one ultimately. The intense pleasure and the renewed vigor which we feel in summer picknickings may serve to indicate the extent to which our old barbaric needs still assert themselves in our mental and physical constitution. We cannot, however, again become out-door barbarians; nor is it urged that barbaric life is more conducive to health than civilized life. We may nevertheless learn from the savage one all-important hygienic lesson. In innumerable ways the savage violates the laws of health; but he at least breathes pure air, and his blood is rapidly oxygenated. Now one of the worst features, perhaps the very worst, of our in-door activity is the way in which it interferes with the due aeration of our blood. And this is a feature of in-door life which we can and must obviate. Partly due to imperfect science, but still more to unpardonable carelessness of the plainest rules of hygiene, is the unquestioned fact that our houses, our schoolrooms, our theatres, and our public conveyances are, as far as the atmosphere is concerned, foul dens of corruption. —*Ex.*

Throat and Lung Diseases.—Most of the throat and lung diseases, which indirectly lead to consumption, are occasioned by sheer carelessness. A delicate woman often sits for two or three hours in a crowded theatre or church, breathing an atmosphere tainted by the exhalations from the lungs of hundreds of other people, her system is exhausted, her skin is excited by unwonted action, and when she leaves the building and goes out in the cold air her blood is suddenly driven to the interior of the body, and then ensues a more or less permanent congestion or inflammation of some of the internal organs—usually the air tubes in or leading to the lungs. This process being repeated many times, a chronic bronchitis is finally established in persons otherwise healthy, and life is ever after rendered miserable by this periodical overheating and sudden chilling of the body, even if the more dangerous malady, consumption, does not interfere, and put the abused body into the grave.

Pure Vegetable Salve.—One pound lard, one-half pound rosin; add ten ounces elder bark; boil these over a slow fire half an hour, then strain and put up in small boxes. This sells at 25 cents a box.

Weakening of Fatal Maladies.—According to M. Alphonse de Candolle, when a fatal malady has seriously affected the younger portion of a population, the succeeding generation, descended from persons who escaped the disease or were but little affected by it, will be found less liable to its attack, as an ordinary effect of the law of descent, this continuing to be the case from generation to generation. This, therefore, constitutes one cause of the weakening of epidemics, and may serve to explain the reason why a disease is most injurious when it first attacks any people, and why it becomes subsequently rarer or less dangerous, as has frequently been observed.

After the lapse of several generations, however, a population moderately affected by a disease approaches the condition of one which has never had it, and an increased intensity may then ensue. Applying these principles to the small pox, M. De Candolle suggests that, at the epoch when Jenner introduced vaccination, the variolic affection had become enfeebled in proportion to the anterior epochs. The vaccination was then more efficacious as applied at this particular period. Small-pox having almost disappeared from Europe for two generations, a new population has sprung up less accustomed to it; and this cause of recrudescence tends now to render vaccination less potent. The author does not pretend that this is the only cause, but that, in connection with others, it exists, and in such a manner as to produce the results specified.

Symptoms of Catarrh.—Indisposition to exercise, difficulty of thinking or reasoning, or concentrating the mind upon any subject, lassitude, lack of ambition or energy, discharge falling into throat, sometimes profuse, watery, acrid, thick and tenacious mucous, purulent, offensive, etc. In others a dryness, dry, watery, weak or inflamed eyes, ringing in the ears, deafness hawking and coughing to clear the throat, ulcerations, death and decay of bones, scabs from ulcers, constant desire to clear nose and throat, voice altered, nasal twang, offensive breath, impaired or total deprivation of sense of smell and taste, dizziness, mental depression, loss of appetite, indigestion, dyspepsia, enlarged tonsils, tickling cough, difficulty in speaking plainly, general debility, idiocy and insanity.

All the above symptoms are *common* to the disease in some of its stages or complications, yet thousands of cases annually terminate in consumption or insanity, and end in the grave without ever having manifested one-third of the symptoms above enumerated.

Transplanting Hair.—The successful transfering of skin and flesh to assist the recovery of wounds, has induced some one to experiment on hair, and the result is a process of removing portions of the scalp, with the hair on, from some luxuriant head, and planting it on the victim of baldness. A cotemporary points out that it may soon become fashionable to wear hair of various hues and shades, thereby producing the most singular and beautiful effects of color; or the hair might be made to appear white, green, blue, or red, at the owner's option, and by various ways of disposing it. "Take, in due proportions, hair of all the prismatic tints, rumple it, and immediately you have white hair; comb it in another way, and there is your purple, your ultramarine, your yellow, or any possible hue." If these directions are followed, the recognition of the original color of the head may require the use of the spectroscope."

Reading in Railway Cars.—The *Philadelphia Medical and Surgical Reporter* has the following sensible remarks on this subject, and we commend them to the attention of all who ride much by rail: Most, if not all who read on railroads, are sensible of weight and weariness about the eyes. This sensation is accounted for on high medical authority by the fact that the exact distance between the eyes and the paper cannot be maintained. The concussions and oscillations of the train disturb the powers of vision, and any variation, however slight, is met by an effort at accommodation on the part of the eyes. The constant exercise of so delicate an organ of course produces fatigue, and if the practice of railroad reading is persisted in must result in permanent injury. Added to this difficulty is bad or shifting light. The safe and prudent mode is to read little if any. The deliberate finishing of volumes in railway cars is highly detrimental.

Frozen Beef Essence.—Dr. H. B. Hare *(Philadelpaia Medical Journal)* writes that, in a case of scarlet fever in a child, the patient could not be induced to swallow the beef-tea which his condition required. As he took ice with avidity, the father suggested that if the beef-tea was frozen he might then be induced to take it in that form. The suggestion was carried out, and the child took the frozen beef-tea readily. This expedient may in many cases be advantageously adopted.

If you are caught in a drenching rain, or fall into the water, by all means keep in motion sufficiently vigorous to prevent the slightest chilly sensation until you reach the house; then change your clothing with great rapidity before a blazing fire, and drink instantly a pint of some hot liquid.

A Good Liniment.—One of the very best liniments that was ever made for man or beast is composed of equal parts of laudanum, alcohol, and oil-of-wormwood.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, May 4, 1872

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, May 1, 1872.—Legal Tenders buying, 90¼; selling, 91. Gold in New York to-day, 112.

Table of Contents.

ILLUSTRATIONS.—Ball's Water Elevator; Peterson's Patent Bee Hive, 273. Illinois Industrial University, 273. The Kirby Two-Wheeled Mower; The Novelty Glass Cutter, 281

EDITORIALS—Mining Stocks; New Method of Prospecting, 273. The Hyde Steam Plow; New Publications, 278. Quicksilver, 280. Railway Progress in Russia; Perfumery Resources of California, 281.

CORRESPONDENCE—Vein Phenomena; Mining, the Great Pursuit of the Pacific States, 274.

MINING SUMMARY—Reports from mines in various States, Counties and Districts: Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 274-5.

MECHANICAL PROGRESS.—Remarkable Testing Machine; Private Gas Manufacture; Copying Press; Mechanical Improvements; Influence of Intense Cold on Heat and Iron; Sheathing Iron Vessels with Wood; The Danks Furnace; Copying Drawings by the Aid of the Induction Coil, 275.

SCIENTIFIC PROGRESS.—Curious Phenomenon of Recurrent Vision; New Method of Measuring the Velocity of Rotation; The Projected Australian Polar Expedition; Auroras, 275.

USEFUL INFORMATION.—Another Scientist on Spiritualism; The Wonders of Chemistry; Terra Cotta; Lubricatore, 279.

GOOD HEALTH.—Needed Sewing Machine Improvement; In-Door Life; Throat and Lung Diseases; Weakening of Fatal Maladies; Symptoms of Catarrh; Transplanting Hair; Reading in Railway Cars, 279.

DOMESTIC ECONOMY.—To Drive Rats Away Without Poison; Composition of Worcestershire Sauce; Filter and Filtering; To Make Chutney; Sleep and Lodging; A Handy Kitchen; etc., 282.

MISCELLANEOUS—The Countries Where Gold Goes; An American Iron Steamship; Accident at Eureka Mill, 274. The Richest of All Gold Fields, 278. Mining Accidents; New Incorporations, 284.

ERUPTION OF VESUVIUS.—Old Mother Earth, after somewhat forcibly calling our attention to the fact that there was something else than railroads, mining stocks and Goat Islands to think about, has gone after the Italians and woke some of them up from their *dolce far niente* to see Vesuvius once more in a state of eruption. Dispatches from Rome state that a number of persons were killed by the lava, which burst up through the ground under their feet. The town of Torre del Greco was in so much danger, that all the inhabitants fled. Naples' dispatches describe the scene as wonderfully grand, and say that the ashes and lava threatened the villages on the mountain side. On the 27th ult., the lava-stream had already reached Sebastian, and threatened other places. The consternation of the neighboring towns is extreme, and earthquakes are the order of the day.

MEN WANTED.—J. L. Hallett, railroad contractor at Portland, wants 3,000 men to work on the Oregon and California, Oregon Central, and Northern Pacific Railroad. He announces steady employment for the season and money every month.

TREASURE SHIPMENT.—The steamship America sailed from here for China and Japan on Wednesday, and carried $1,524,570.22 in treasure. The total shipments since January 1st is $10,067,217.22.

EARTHQUAKES.—A shock of earthquake was felt at Salinas City on the 1st inst., and at the same time in Gilroy. It is said to have been heavy but no damage was done.

ON FILE.—"The Minea of Utah;" "San Diego Minea" and the "Limestone Belts of Nevada."

Quicksilver.

The long prevailing high price of quicksilver has excercised an important influence on our mining interests, and the importance of obtaining it at low rates will be evident to all, except producers. In the production of gold and silver hullion, quicksilver is an indispensible requisite and without it our mines could not be developed, unless the ingenuity of our people could devise some suitable substitute not now known. The production of this necessary article at the cheapest possible rates, is a matter of great interest to our mining population, and the many mines of this metal in California, by proper and economical working with suitable appliances and without combinations, to keep up rates, should be able to produce and sell it at a much more reasonable price than present quotations. A low price for quicksilver would cause an increase in consumption, and of course, larger sales, requiring a greater production. It is an absolute necessity for the purposes for which it is mainly used and for amalgamating particularly, where it is now used with a sparing hand, a more plentiful supply would be a material benefit.

The European Mines.

The amount of quicksilver which the various mines of the world are capable of producing, is very large, much larger in fact, than is demanded for any purposes to which it is at present applied, and the only reason why it is held so high is, that a few parties have control of the supply of the world. The Almaden mine in Spain, discovered in 1497, yielded for 250 years, from 550,000 to 650,000 pounds per annum. In 1750, when the Huancavelica mine of Peru caved in and the supply from that source was temporarly cut off, the Almaden increased its production to about 2,016,000 pounds per annum and has continued to yield that amount ever since. The Santa Barbara mine of Huancavelica which had, up to 1867, produced $80,000,000 worth of quicksilver, is now abandoned. The reasons given are its distance from seaboard, low grade of ores, scarcity of fuel, being unable from these causes to make any profit in competition with the other great mines of the world. The Idria mine in Transylvania is another of the important mines of the world and its production is from 600 to 800 flasks per month. The ores are of a low grade. This mine is under lease from the Government.

The California Mines.

California, among its numerous mineral advantages, possesses the broadest fields of this necessary article in the world and by far the most prolific of its mines is the well-known New Almaden, in Santa Clara county. As it may be interesting to know the amount produced from this mine yearly as the representative one of California, the following figures will show it, in flasks, premising that the flasks contain 76½ pounds of quicksilver. In 1851, the number of flasks produced was 23,875; in 1852, 19,921; in 1853, 18,035; in 1854, 26,325; in 1855, 31,860; in 1856, 28,183; in 1857, 26,002; from July 1857 to October 1858, 39,935. From that time to February 1861, the mine was closed by injunction. From February 1861, to January 1862 it produced 34,765 flasks; in 1862, 40,391; in 1863, 19,564; in 1864, 46,216; in 1865, 47,194; in 1866, 35,150; in 1867, 24,461 flasks; in 1868, 25,628; in 1869, 16,898; in 1870, 14,000, and in 1871, 18,763 flasks. Total up to January 1872, 537,176 flasks, each containing 76½ pounds of quicksilver.

The New Idria mine in Fresno County produced in 1866, 6,045 flasks; in 1867, 11,500; in 1868, 12,300; in 1869, 10,450; in 1870, 10,000, and in 1871, 9,227 flasks. The Redington mine, near Knoxville, Lake County, produced in 1866, 2,980 flasks; in 1867, 7,145; in 1868, 8,700; in 1869, 5,000; in 1870, 4,546, and in 1871, 2,128 flasks.

Among the other mines whose product goes to swell the gross amount, are the Guadalupe in Santa Clara county, owned in Baltimore, Md.; the Josephine in San Luis Obispo county, owned by Barren & Co.; the Enriquita, owned by the Almaden, and the Bautista, owned by the Almaden, and now idle, both in Santa Clara county; the Pioneer is in Napa county. The Whitton is in Napa county and there is one at Oakville. The Vallejo mine is in Solano county; the Manhattan or Knox & Osborne mine is three miles from Knoxville, in Lake county; the California is in Yolo, and there are several in Pope valley near Napa. the Abbot mine is in Lake county; Excelsior in same county. There are several in Monterey, one of which is called the Pennsylvania, which produced a small quantity, and one owned by McGarrahan not now being worked. There is one at Mount Diablo, Contra Costa county, which produced a small quantity but is now in litigation. An occasional flask comes from the San Luis Obispo mines. The Biotte and Lockhart mine is at St. Helena, Napa county. The Phoenix in Pope valley, Napa county, produced in 1870, from a partial working, only 763 flasks. There is also a mine in San Bernardino county, and several recent discoveries in Napa and Lake counties, and a number are spoken of from which we hear little, in the Coast Range, from up north down to San Bernardino county. The total product from all the California mines mentioned, for the last three years, was, according to the *Commercial Herald*, as follows: In 1869, 36,600 flasks; in 1870, 29,546 flasks; and in 1871, 31,881 flasks.

The total monthly product at present is said to be not over 3,100 flasks of which the New Almaden furnishes 1,600, the Redington 600, the New Idria 600, and all others 300. The New Idria cleaned up 2,000 flasks in January, 40 from the mine and the remainder from what had accumulated inside the condensers.

Cause of the High Price of Quicksilver.

Quicksilver has remained at a high rate for the past three years and at such a one as the amount of production and demand does not warrant. A combination orring control the whole supply and keep the prices where they can make the most profit. Through the agency of Mr. Butterworth, the manager of the Almaden, a contract for the delivery of 50,000 flasks from the product of the mine prior to April 1st, 1868, was made in 1866 with the late Mr. W. E. Barron for $30 per flask. They obligated themselves not to sell or consign any quicksilver from the mine until this contract was completed. Messrs D. O Mills and W. C. Ralston were Mr. Barron's securities for the faithful performance of his part of the contract which was to advance $150,000 on the debt of $250,000 of the Co. and if necessary advance money to meet the full amount. The contracting parties found, in April 1868, that the production exceeded the demand, or rather that while the production was increasing the demand was the same, and declined to contract to purchase any more. However, another contract or agreement was made between Butterworth representing the New Almaden, Barron and Mills controling the New Indria, and the owners of the Redington mine for two years. By the terms of this contract, as far as known, these mines were to limit their production to a certain amount, Barron & Co. were to be shipping and foreign agents, Redington & Co. local agents for the sale of the quicksilver here. The product of the mines was reduced and by the arrangement made the combination netted a profit of about $35 per flask on the sales. The Annual Report of the New Almaden Company for 1870 states that the financial matters of the mine were in a bad state and $55,000 was required immediately to settle a law suit. There was also a large amount due the Bank of California. The agent, Mr. Butterworth, to get out of this financial difficulty, entered into contract with D. O. Mills to sell him the 15,525 flasks of quicksilver hitherto delivered to Barron & Co. under combination contract and all that would be delivered up to April, 1870, under said contract, at $32 in gold per flask. And all the product for two years from April 1870 at $31 gold per flask, half cash on delivery and half cash in 60 days, he discounting all deferred payments at current rates of interest if the company should require. The company had the right to deliver an average of 2,000 flasks of quicksilver monthly. He was to pay the company any sum that might arise after deducting amount due to Barron & Co. for advances on the quicksilver under their contract.

When the combination contract between the New Almaden, New Idria and the Redington mines expired, the owners of the Redington, knowing that the two other mines were controlled by the same parties, declined to enter into any new combination or sell their product for the price which the New Alamaden did. They finally entered into contract with Barron and Mills to sell their product for 10 years. The price was not made public but was generally understood to be $40 per flask and the production was to be limited to a certain amount, Redington & Co. under this agreement were still to have the local sale.

The Almaden mine in Spain is entirely in the control of the Rothschilds, who have a lease of it. This mine supplies the London market and a large part of Europe, and also Mexico. California supplies the United States, China and India, so the world is divided between the two great producers. An understanding exists between the two controlling parties which permits each to dispose of their quicksilver in their respective markets. The result is that a pound of quicksilver, owing to the duty of 15 per cent., is 15 per cent. dearer in California, where it is produced, than in Mexico, to which place it is exported from Spain.

By referring to the figures given above it will be seen that the product of the several mines has gradually decreased since these combinations were formed. The consumption is of course limited and an over supply would not suit the measures of the men who have control. Moreover, what is consumed would be consumed if it were $1 or $1.50 per pound, just the same as at 85 cents, but small miners could not use it to advantage. The amount lost in amalgamating has been discussed at length in the SCIENTIFIC PRESS. The Almaden ores just as they come from the mine would not average over 3 per cent. metal, and the Napa mines not more than one per cent., so a good deal of ore is rejected. Three per cent. ore however will pay well, and all of the mines would pay if they chose to sell at lower rates. Some of the mine owners, however, sell their product to the Bank of California combination, while others with small lots traffic with hardware dealers or others who supply parties in the interior. They generally undersell the combination a few cents, but the amounts are so small they make little difference. Although it is understood that the contract of this combination expired on the 1st of April of this year, their profit has been so immense that it is probable that there will be a renewal, and a combination of the various mines and interests will most probably be effected. So far as known no such step has yet been taken but as prices remain as they have for months past it is to be supposed that we will have no reduction for some time to come. The owners of the Redington purposely keep down their product because they prefer to keep the ore in the mine rather than sell it at the price agreed under a contract which only compels them to deliver what they manufacture. The only chance we would have to get a decrease in price would be in case a number of the new mines would refuse to enter the combination and increase their product, but there is little chance of this. The ring have too good a thing of it, and doubtless intend to continue their operations on the old basis. Perhaps we ought, under the circumstances, to congratulate ourselves on being able to get it even at the advanced price we do. Still it seems lamentable that an article which is so indispensable to our mining operations should be subject to a speculative combination, without any conscience as it depresses the leading industry of the coast. The miner requiring the use of quicksilver in California is obliged to pay the monopoly price 85 cents per pound, while a merchant exporting pays but 80 to the same company for the same material.

DOVER STRAITS.—The question of getting across the British channel without going in steamboats has agitated the English mind for many years, and a number of schemes have been proposed and abandoned. Recently a company has been incorporated in London, with the intention of connecting France and England by a tunnel under the sea. The sum of £2,000,000 is to be used in testing the feasibility of the plan, and if the experimental work proves successful, both countries are expected to join in pushing the enterprise to completion as quickly as possible.

UTAH NEWS.—An English company has commenced suit for the possession of the well-known Flagstaff mine in Little Cottonwood, U. T., claiming it as the property originally located as the General Grant.

A great quantity of mining machinery is coming into Salt Lake City, and it is said that heavy contracts for mills are out. The mine owners evince a strong desire to reduce their own ores, and ship bullion only.

THERE are 17 pneumatic tube lines in operation in the city of London, varying in length from 980 to 29 yards.

Railway Progress in Russia—Manifest Destiny.

Russia is making advances in her system of railway commnnication. It was said two or three years since that Russia was "railway mad." If snch was the case there is much method in her madness, and her vagaries have been of much benefit to her in every point of view.

The government, by placing the snow-bound and mud-bonnd interior in rapid and easy communication with the ports, has enabled Russian manufacturers and agricnlturists to develop their respective industries with the most wonderful results; and the consequence has been that railway extension is still regarded with the highest favor.

Yet with all that has been done, there is ample room for fnture progress in this direction. The extent of the Rnssian Empire is larger than that of the United States, and, like these States, extends from the Atlantic to the Pacific. As yet she has but about 9,000 miles of lines, while the United States has some 65,000. It is also noticeable that, in Rnssia, as elsewhere, production, industry and the general improvement of the masses, keep equal pace with the extension of the iron road.

In view of these facts there is nothing unreasonable in prosuming that Russia will continne to press forward her railway system, with even an accelorated ratio, until every part of that magnificent empire shall be bound together and consolidated by this great annibilator of time and space. Thns conditioned, the arts, sciences and indnstries will soon become as fully developed in Russia as upon the most favored portion of Central Europe; for the Rnssian, with equal facilities, is not much behind the native of any otber portion of Europe, in anytbing which goes to make up a great and progressive people.

There is one significant fact, which has been observed in the Rnssian railway system, and that is that her railway gauge has been studiously fixed so that it cannot be used by the rolling stock of any other part of Europe. Under these circumstances, in case of a war between that power and any other European nation, her railway system will be of no account to her enemy in pnshing his conquest over the border, while she herself will enjoy its full advantages to the very extent of her domains.

The late German-Franco campaign would have been an utter impossibility, had Napoleon imitated the Czar in that respect. In that campaign Germany witb all of her rolling stock, fitting the French tracks and the enormous resources of her shops and artisans, could not bave laid siege to Paris, had she not impressed an immense amount of the same material belonging to the Austrian Empire, which she from time to time found within her borders, and confiscated at an enormous cost for settlement with their legitimate owners.

This policy on the part of Russia is manifestly a peaceful one—all she wishes is to be "let alone," and for that she is taking security in a most efficient manner. It may be observed, however, that while she is thus rendering herself impregnable at home, she is also placing herself at great advantage in her Asiatic aspirations. Her railroad system will be brought to the very borders of her Asiatic neigbbors, who will thus be placed absolutely at her mercy, while the allies of those nations will be compelled to operate to great disadvantage for the lack of such facilities.

The manifest destiny of Russia is as sure in its ultimate domination over Europe and Asia, as is that of the United States over every portion of the American Continent.

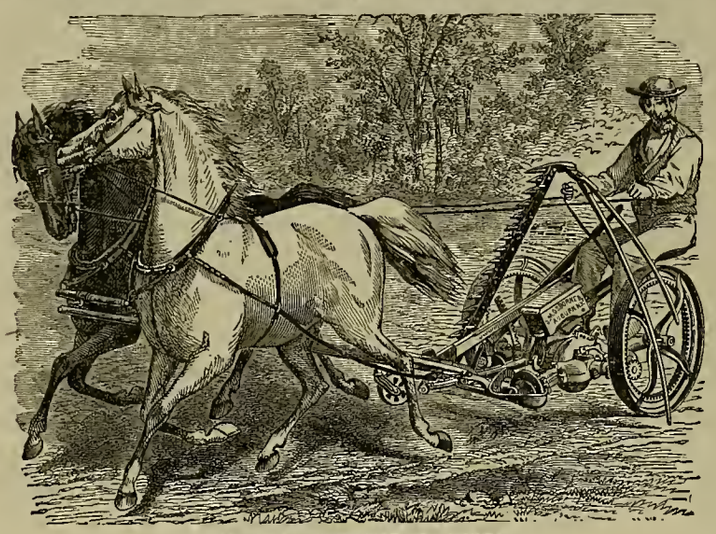
Sales.—It is understood that the Keystone quicksilver mine in San Luis Obispo county has been sold for $36,000. A dispatch from SaltLake states that the Silver Wreath and half of the Lookout mines at Schell Creek, were sold on the 29th inst., to an English Company, for $50,000. Another dispatch dated the 1st inst., says that the Vallejo Company have been offered $1,000,000 for their property by English capitalists.

The Kirby Two-Wheeled Mower.

Our object in presenting the accompanying illnstration, is to attract the attention of the readers of the Press, to a new featnre for this coast, in mowing and reaping machines. We are aware of the reputation long since awarded to the old Kirby mower, and that it has successfully maintained its excellent reputation; its complete success, as claimed by its inventor, having never been excelled in the history of mowing machines.

In its present improved form, it possesses a perfection of principle that secures the execution of the best possible work. It has the flexibility and independent motion of frame and finger-bar peculiar to all Kirby machines, cntting close and clean over all variations of ground. One of its great excellencies is, its jointed connecting rod—or pitman — a feature belonging exclusively to this mower; the joint in the connecting rod working simultaneously with the joint in the finger-bar, keeps the connecting rod always in perfect line with the cutting apparatus, allowing the knife to run perfectly free, without binding, at whatever angle the bar may be raised or folded.

By a convenient lever, the bar is raised to pass any obstruction, even a tree, or can be folded completely across the machine in front for transportation, without throwing out of gear, stopping the team, or the driver leaving his seat; and yet can be instantly thrown out or



THE KIRBY TWO-WHEELED MOWER.

into gear without stopping when desired, by either foot or hand. No stopping to fasten finger-bar in position when folded. A loose or rigid tongue as desired, without stopping.

Another peculiar feature is the raising or lowering of the points of the guards or fingers without stopping, giving them any pitch or angle to suit the grass or ground. The driver's seat is also a lever to command the heel of the cutter bar raising or lowering it at pleasure; and as if to make it a more perfect machine over others, it possesses a device expressly applicable to California machines, by which the connecting rod or pitman will take up its own wear thus preventing all shake or jar and breaking of the knives.

Our illustration represents it as a mower, but it possesses the combined feature of reaper or mower, and with the "Baltimore" self-rake attachment, becomes as claimed by the proprietor, the most perfect reaper the world has ever seen.

San Diego Mines.—Dispatches from San Diego state that at Julian City, last week, the mill of De Frees, after a run of eleven days on one hundred and fifty tons of rock from the Owen's mine, was cleaned up, the result being nine bars of bullion valued at $10,000, an average of $66.66 per ton. Fifty tons of this rock was principally composed of casing rock, which helped to lower the general average. The shaft is down now two hundred feet and at this depth a drift is being run, the rock from which it is expected will yield $100 per ton. Twenty-six tons of ore from the Big Blue mine gave $1,090 or an average of $42 per ton. The mines in this district are being developed rapidly and most of them show a higher character of ore as they go down. A line of stages will shortly be put on between Julian and Los Angeles.

The thermometer on Wednesday at noon, stood at 72°, in this city.

Perfumery Resources of California.

An Eastern merchant, largely interested in the importation of fine and expensive oils, and choice perfumeries, visited Southern California about two years since, and in a letter to the New York *Daily Globe* said: "This portion of the Pacific coast is naturally suited to the growth of flowers; from its native capabilities it ought to be the centre of perfume and oil manufactory and trade. The choicest material for expensive oils is wasted here to the amount of thousands of dollars during the season." This branch of California's resources has often been commented upon by the tourist, but no one has yet attempted to engage in the business. No doubt the time is not far distant when the choice varieties of blossoms that are native and prolific to this clime and soil, will form the material for a large manufacturing business, and result in a steady resource of wealth to the manufacturers.

Orange Flowers, Etc.

One of the chief productions of Southern California is the orange. It thrives wondrously there, and is already one of the features of trade in that section. Los Angeles oranges possess sweeter and richer flavor than the Tahiti oranges, and command a better price in San Francisco markets. The peel of the Los Angeles orange is thicker, sweeter and tenderer, containing more oil than any other orange in the Pacific markets. The distiller would in time find the orange groves of California a productive field for material.

From reliable authority we find and refer to a few facts connected with the orange waters and the manufacturers of the same. Two distinct odors are procured from the orange blossom varying according to the different methods used for its distillation and production. To the manufacturer this difference of perfume from the same flower is a great advantage, and is a fact worthy of investigation by the chemical philosopher. Doubtless this peculiarity belongs to all fruit blossoms.

When orange flowers are distilled with water we obtain the otto of the blossom, which is known as the Oil of Neroli; this Neroli produced from the *citrus aurantium*, is considered the finest quality. The next quality is from the Seville orange, called "bigaradid," this and the "neroli petale" are used to an enormous extent in the manufacture of "Eau de Cologne," and other choice perfumes.

Essence of orange, or, as it is called, "Essence of Portugal," is obtained from the peel of the fruit, and is produced by distillation. The peel is rasped in order to break the sacs that hold the otto; this otto will ignite with a brilliant combustion. It is used universally in perfumery, and is the main ingredient in Lisbon water. The Los Angeles orange contains more otto in its sacs than the Isthmus or Tahiti orange. Experts in perfumery manufacturing say that nowhere in the world are there better facilities for this trade than is offered in Southern California.

There is also a constantly increasing demand for perfumery, made by the soap, cream, pomade and oil manufacturers. All absorbent powders require delicate and expensive flavors. The citron-lemon of California possesses a delicious perfume, and the oil is even superior in every particular to the orange.

The almond flourishes in lower California better than in other climates, and the value of its oil, and the universal use of its perfume, is too well known to be repeated. Of the flowers we particularly observe the heliotrope and the rose; the flowers bloom heavily, and are more heavily charged with odors than those of more northern growth. If the floral varieties necessary for oil and perfumery manufacturing purposes were cultivated and grown in view of such supply and demand, the results in Southern California would astonish the world. The only attention given now is to door-yard growths and ornament; but if hundreds of those rich acres were given to flower-planting for commercial purposes, we might challenge the world to vie with us in the production and value of the same.

The quantity of otto yielded by one or more of such plants as are native to Los Angeles may be given here for the purpose of showing what value could be placed on the same if manufactured at home:

Orange peel,	10 lbs.	yield, of otta	1 oz.
Almond,	14	" "	1 oz.
Geranium leaves,	100 lbs.	"	2 oz.
Peppermint (herb),	100 lbs.	"	4 oz.
Lavender flowers,	100 lbs.	"	30 oz.

This is a list of only a few plants, but sufficient to show the product of each variety. The otto of lavender is now manufactured or produced almost exclusively by the French. Turkey, Hindostan, Africa and England produce the majority of our essence and handkerchief perfumes. Tonquin furnishes the musk.

Lavender, jasmine, orange and rose are the leading combinations of commercial perfumes and waters.

The Novelty Glass Cutter.

The little device shown in the cut is intended to take the place of the more expensive diamond glass cutter now in use, and will perform its work as readily and with equal exactness, while the original cost is much less. The indentures

shown are of different sizes for different weights of glass. The cutter is a small piece of carbonized steel which revolves on a pin at the end of the handle. It is easily managed and requires much less skill than the diamond point for the exactness of position does not matter so much. The roller is placed on a piece of cast iron which is all in one piece, so there is no danger of the handle becoming loose and rickety.

This machine will be found very useful, from its cheapness, in the country where glass can be cut and fitted without waiting for a glazier to come around. In fact, a little tool like this is invaluable, and should be in every household, for its applications are numerous and its cost very little. Weister & Co., No. 17 New Montgomery street, will send sample cutters to any address, post paid, for 75 cents in stamps.

Nevada County Mines.

Our correspondent, L. P. Mc., in his recent notes of Travel in Nevada County, omitted to mention Brown's Cement Claim, which is one of the first-class claims in the vicinity of You Bet. It is owned by Judge G. S. Brown and is located about a quarter of a mile south of You Bet, and south of and adjoining the claims of the English Company, or Birdseye Creek G. M. Co. The main channel cuts it from northeast and southwest. It contains about 24 acres of mining ground. About one quarter of the surface has been washed to within 50 feet of the bed rock and one quarter of the bed-rock has been drifted over. At present it is not being worked but when it was worked it paid as well as the best in the county.

The outlet to this celebrated claim is through Wilcox's ravine. Mr. Brown owns about 4,000 feet of this ravine and through it, eventually, all that portion of the Birdseye Creek G. M. Co.'s ground underlying the town of You Bet will have to be worked. From 1,500 to 2,000 acres more of mining ground lying in the direction of Chalk Bluff will have to be worked through the same ravine. This claim has been worked successfully since 1865 and up to July 1870 over $600,000 in gold was taken from it. Mr. Brown also owns an 8-stamp mill for crushing cement, which is run by a hurdy-gurdy wheel using 50 inches of water.

DOMESTIC ECONOMY.

To Drive Rats Away Without Poison.

We know of three methods: First, the old French plan; this is followed chiefly in Paris by men who make it a special business. They take a deep tub with water in the bottom, and a little elevation in the middle like an island, on which is only a place for just one rat to sit. The top is covered, and has a large balanced valve, opening downward; on the middle of this valve a piece of fried pork or cheese is fixed, and when a rat walks on it to get the cheese, the valve goes down, and drops the rat in the water, and moves back into position. A road is made from a rat hole to the top of the tub by means of a piece of board rubbed with cheese, so as to make the walk attractive to the rats. In the course of a single night some ten, twenty, or even more rats may go down, and if the island was not there they would be found most all alive in the morning quietly swimming around; but the provision of the little island saves the trouble of killing them, because their egotistic instinct of self-preservation causes them to fight for the exclusive possession of the island, on which in the morning the strongest rat is found in solitary possession; all the others being killed and drowned around him.

Second, the New York plan, invented by one of our friends. The floor near the rat hole is covered with a thin layer of moist caustic potassa. When the rats walk on this it makes their feet sore; then licking their feet makes their mouths sore; and the result is that they shun this locality, not alone, but to tell all the rats in the neighborhood about it, and eventually the house is entirely abandoned by them, notwithstanding the houses around may be teeming with rats.

Third, the Dutch method; this is said to be used successfully in Holland; we have, however, never tried it. A number of rats are left together by themselves in a very large trap or cage, with no food whatever; their craving hunger will, at last, cause them to fight, and the weakest will be eaten up by the others; after a short time the fight is renewed, and the next weakest is the victim, and so it goes on till one strong rat is left. When this one has eaten the last remains of any of the others, it is set loose; the animal has now acquired such a taste for rat-flesh that he is the terror of ratdom, going round seeking what rat he may devour. In an incredible short time the premises are abandoned by all others, which will not come back before the cannibal rat has left or has died.

COMPOSITION OF WORCESTERSHIRE SAUCE.—White vinegar, 15 gallons; walnut catsup, 10 gallons; Madeira wine, 5 gallons; mushroom catsup, 10 gallons; table salt, 25 pounds; Canton soy, 4 gallons; powdered capsicum, 2 pounds; powdered allspice, 1 pound; powdered coriander seeds, 1 pound; cloves, mace, and cinnamon, of each ½ a pound; assafœtida, ¼ pound, dissolved in brandy, 1 gallon. Boil 20 pounds of hog's liver in 10 gallons of water, for 12 hours, renewing the water from time to time. Take out the liver, chop it, mix with water, and work it through a sieve; mix with the sauce.

Imitation No. 1.—White vinegar, 240 gallons; Canton soy, 36 gallons; sugar house syrup, 30 gallons; walnut catsup, 50 gallons; mushroom catsup, 50 gallons; table salt, 120 pounds; powdered capsicum, 15 pounds; allspice, 7 pounds; cloves, mace, and cinnamon, of each 4 pounds; coriander, 7 pounds; assafœtida, 2¼ pounds; dissolved in St. Croixrum, 1 gallon.

Imitation No. 2.—White vinegar, 1 gallon; Canton soy, 1 pint; molasses 1 pint; walnut catsup, 1½ pints; table salt, 4 ounces; powdered capsicum, 1 ounce; allspice, 1 ounce; coriander ¼ ounce; cloves, ½ ounce; mace, ½ ounce; cinnamon, 6 drachms; assafœtida, ¼ ounce; in rum 4 ounces; mix.

Imitation No. 3.—Take port wine and mushroom catsup, of each 1 quart; walnut pickle, 1 pint; soy, ½ pint; pounded anchovies, ½ pound; fresh lemon peel, minced shallots, and horse radish, each 2 ounces; allspice and black pepper, bruised, each 1 ounce, (or currie powder, ¼ ounce), digest for 14 days, strain, and bottle.

FASTENING LOOSE WINDOW SASHES.—The most convenient way to prevent loose window sashes from rattling unpleasantly when the wind blows is to make four one sided buttons of wood, and screw them to the stops which are nailed to the face casings of the window, making each button of proper length to press the side of the sash outwards when the end of the button is turned down horizontally. The buttons operate like a cam. By having them of the correct length to crowd the sills of the sash outwards against the outer stop of the window frame, the sash will not only be held so firmly that it cannot rattle, but the crack which admitted dust and a current of cold air will be closed so tightly that no window strips will be required. The buttons should be placed about half way from the upper to the lower end of each stile of the sashes.—*Industrial Monthly.*

SNOW BALLS.—One cup of sugar, two eggs, four tablespoonfuls of milk, one teaspoonful of cream of tartar, one teaspoonful of soda if the milk is sour, if sweet one-half teaspoonful, flour enough to roll into balls. Fry in lard, dip in the white of an egg, then white sugar till white all over.

Filters and Filtering.

Water, wine, spirits, jelly, syrup, tinctures, and a great variety of other fluids, hot and cold, often contain substances which should be separated, in order to render the fluid clear and bright. As regards water filtering, it has become pretty general; but in domestic life there are fluids, such as wine, liquid jelly, syrup, etc., which are required to be made "clear" before they are put on the table. There are three kinds of filters—sponge for watery liquids, cotton for spirituous fluids, and wool for gelatinous fluids and oils. In every well appointed kitchen, there are tin or porcelain funnels. For filtering watery fluids it is only necessary to insert, in the choke of the funnel, a V shaped piece of fine sponge. All such liquids, on being put into the funnel, will pass through the sponge, and become quite clear. When this effect ceases the sponge must be removed, and well cleansed. Viuous fluids are best cleared by filtering through a coue of white blotting paper, shapped by folding a square piece of paper from corner to corner, then folding the triangle into half its size, and opening the folds; it will fit any funnel, which will act as a support to the paper.

Wines, etc., poured into this, will run through perfectly bright. In some cases where the wine is only a little thick from lees, cork, or other mechanically suspended substance, it can be made quite clear by filtering through a wad of white cotton put in the choke of the funnel; and when this answers, it is much quicker than the paper filter. For jelly and oil, wool alone is the proper medium for filtering. The felted wool jelly bag is pretty well known as the best means of clearing calves' foot jelly, and it also answers for olive and other oil. These bags are, however, too expensive to be generally used: hence they are rarely seen in kitchens. A good substitute for the wool bag is a colander, on the inside of which a new flannel lining should be fitted, made of double stuff. A wad of white knitting wool, put in the choke of a funnel, will do to filter any small portion of such fluids. Many a good glass of port wine has been wasted for the want of a penny paper filter.

TO MAKE CHUTNEY.—Indian chutney is a compound of mangoes, chillies, and limejuice, with some portion of other native fruits, such as tamarinds, etc., the flavor being heightened by garlic. For family use the following receipt will be found very suitable: Chillies, 1lb. to 1½lbs.; apples, 1lb.; red tamarinds, 2lbs.; sugar candy, 1lb.; fresh ginger-root, 1lb.; garlic, ½lb. to ¾lb.; sultana raisins, 1½lb.; fine salt 1lb.; distilled vinegar, 5 bottles. The chillies are to be soaked for an hour in the vinegar, and the whole ground with a stone and mullor to a paste. Here is another receipt which may be depended upon for making an excellent chutney:—1lb. salt; 1lb. mustard seed; 1lb. stoned raisins; 1lb. brown sugar; 12ozs. garlic; 6ozs. cayenne pepper; 2 quarts unripe gooseberries; and 2 quarts best vinegar. The mustard seed should be gently dried and bruised, and the sugar made into a syrup with a pint of the vinegar; the gooseberries dried and boiled in a quart of the vinegar; the garlic to be well bruised in a mortar. When cold, gradually mix the whole in a mortar, and with the remaining vinegar thoroughly amalgamate them. To be tied down close; the longer kept the better.

SEA WATER IN BREAD-MAKING.—It was stated at a meeting of the Academy of Science of Paris that while excellent bread can be made with sea water, and that this forms a good tonic, soup or broth made with sea water is entirely uneatable. It would appear that the chloride of magnesium in the sea water is raised to a temperature, during the process of baking, sufficiently high to effect its destruction, and thereby cause its peculiar taste to disappear, which is not the case when boiled, as for soup. If, however, cane-sugar is added to the soup, a compound is said to be formed of the sugar with the chlorides, which has not the disagreeable taste of the latter.

TO DETECT THE ADULTERATION OF WINES.—The adulteration of wines with cider can easily be detected by filtering and adding ammonia in excess. The apple juice will immediately deposit crystals on the side of the test tube. Genuine wine sheds a pulverulent deposit which does not adhere to the glass, and is devoid of a crystalline structure. Acetic acid will dissolve either of these precipitates. The deposit from the cider consists of flat crystals with parallel sides; that from wine shows star-shaped formations. The treatment with acetic acid shows the presence of lime and phosphoric acid in both cases, the quantity of lime in the wine being minute.

CURING OF HAMS AND BACON.—In curing hams and bacon it will be found very advantageous to use the same quantity of common soda as of saltpeter—one ounce and a half of each to fourteen pounds of ham or a piece of bacon, using the usual quantity of salt. The soda prevents that hardness in the lean of the bacon which is so often found, and keeps it quite mellow all through, besides being a preventive of rancidity. This receipt has been very extensively tried for fifteen years, and invariably approved of.

SOUR CREAM BISCUITS. Sift one teaspoonful each of salt and soda into one quart of flour, in the bread pan. Have ready one pint of sour cream, beat one egg and add to the cream, stir, roll and cut, and bake as quickly as possible.

Sleep and Lodging.

Next to food comes lodging. To secure a comfortable bed is to the greater part of mankind still a desideratum—and yet any man of ordinary capacity may himself make the foundation for an excellent one with a few hours' labor. When we reflect on the importance of sleep, the time thus spent will not appear wasted. Without sleep insanity is certain. Nearly one-third of life must be passed in sleep. Why we are thus constituted is not to the present purpose. What relation the hours of sleep hold to the inclination of the earth's axis, or if the inhabitants of the planet Mars sleep, we shall not stop now to inquire. It is enough, with Sancho Panza, to invoke blessings on the man that invented sleep—"it covers one so like a blanket," "tired nature's sweet restorer, balmy sleep," descending as it does "like tired eyelids over tired eyes."

How strange it is that in this decade of the nineteenth century, we should first be able to compel the attendance, certainly and securely, of sleep—to realize the truth of the fable of Lethean waters. Opium gave us this boon at the expense of a feverish reaction; morphine promised it, but failed in the performance; chloroform gave it, but at a serious risk. How suddenly chloral has come into use! Almost as quickly as the shades of night, which it so aptly represents, has this invention crossed the Atlantic on downy pinions to visit the abodes of American care and distracting brain labor. This is the veritable angel of sleep. Of the bed-bottoms conducive to sleep: The foundation of the superstructure should be firm, open, elastic, noiseless; affording no harbor to insect denizens. It is of no consequence to the prominent hip-bones and short ribs of an emaciated sleeper, whether they are a few inches more or less distant from the floor; but it is of consequence that the prominent portions of the body should find for themselves correspondingly depressions in the supporting medium, thus extending the surface of contact and avoiding chafing.—*Ex*

A HANDY KITCHEN.—The other day we went into a model kitchen. Between it and the dining-room a small passage served as a closet, and also to keep all odors of the kitchen from reaching the dining-table. On one side of the kitchen was a large range, beyond that a sink with hot and cold water leading into it, and a waste-pipe from it. At the end of the room, between two windows, screened to prevent the ingress of flies, stood a long work-table, with a series of drawers. On the other side of the room were two stationary tubs, each with faucets for hot and cold water and a discharge pipe. Hinged covers made an ironing table firm and ample.

Just beyond the sink a door opened into the pantry, a room four by ten, with a window, a shelf running round three sides of it, wide and high enough to cover barrels of flour, sugar and meal.

At one end of the space beneath this shelf was filled with deep drawers for towels, table-cloths, the ironing blanket, starch and blueing, each in appropriate place. The housewife needed but a step in there and find everything at hand necessary to prepare food for the table. No running up stairs for meal and flour, no getting ready to make bread, or pies, or cake; pans are close by; spices in neat boxes at her elbow; coffee-mill, with a little shelf under it to hold the cup, was screwed over the window casing. What hardships are there in doing work in such a kitchen?—*Ex.*

RAISED CRUST FOR PIES.—Some persons cannot eat rich pastry, and for their benefit I will give a plain recipe. Take one pound of flour, three ounces of butter, one tablespoonful good yeast, and milk to form a dough. Rub the butter in flour, add the milk and yeast, and set to rise. When light, roll out pretty thin, and line the plates. Put in the fruit, roll out the cover, and set the pies in a quick oven. This makes good crust.

TO KEEP DRIED FRUIT FREE FROM WORMS.—Housekeepers and others are much troubled to keep their dried fruit free from worms. A contemporary says that a handful of sassafras bark sprinkled through a bushel of fruit is a preventive from this pest. Has any one ever tried it?

HOW TO STOP A PINHOLE IN A LEAD PIPE.—Take a ten-penny nail, place the square end upon the hole, and hit it two or three slight blows with a hammer, and the orifice is closed as tight as though you had employed a plumber to do it at a cost of a dollar or more.

CHEAP CAKE.—Chop a cupful of fat pork and pour on it a cupful of boiling water, add a cupful of molasses; boil a few minutes, and add salt, soda, spice, (cloves are best,) and flour for a batter. Bake in one loaf.

THE very best way to clean a stained steel knife is to cut a solid potato in two, dip one of the pieces in brick dust (such as is usually used for knife cleaning), and rub the blade with it.

JOHNNYCAKE.—Beat one egg, add one cup of sour milk, one cup of sweet milk, one teaspoonful of soda, from one to three tablespoonfuls of molasses, salt, and stir quite soft.

HOG'S hair is recommended for hen's nests by a correspondent of the *World*. He says hens setting in these nests have never been infested with bee.

THE richer a man makes his food, the poorer he makes his appetite.

PACIFIC STONE COMPANY.

Ransome's Patents,

For which Commissioners for the International Exhibition of 1862 awarded the Prize Medal, and Gold Medal at the Mechanics' Institute Fair, 1871, of San Francisco.

REMOVAL.

This Company have removed from the corner of Turk and Larkin streets, to their new and Commodious works corner of Greenwich and Octavia. They have established an office and salesyard at the Junction of Market and Bush, where they will keep constantly on hand an assortment of ORNAMENTAL, BUILDING, CEMETERY and GRINDSTONES. Orders will be received at the above office from all who wish to get good work at low prices. Send for Circular. 6v24-3amslamrly

Dupont's Gunpowder, Safety Fuse,
—AND—
WINCHESTER REPEATING ARMS.

DUPONT'S Superior Mining Powdor (saltpetre), F-FF-FFF.

DUPONT'S Blasting Powder, in air-tight corrugated Iron Kegs, C-F-FF-FFF.

DUPONT'S Celebrated Brand, Diamond Grain, Nos. 1 2, 3 and 4, in 1 lb. and ½ lb. canisters.

DUPONT'S Unrivalled Brande, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kege, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canietera.

DUPONT'S Standard Rifle, Fg-FFg-FFFg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canistere.

DUPONT'S Superior Rifle, A. F. & Co., F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.

DUPONT'S Cannon, Musket, Meal and Fine Powder.

EAGLE SAFETY FUSE (manufactured near Santa Cruz, Cal., by the L. S. & P. Co.) Constantly on hand full supplies of their Celebrated Brands, Waterproof and Submarine, Triple Taped, Double Taped, Single Taped and Hemp Fuse. Fuse made especially to explode the Giant Powder and Hercules Powder Caps.

The above named Fuse are warranted equal to any made in the world.

WINCHESTER REPEATING ARMS (Henry's Improved) and FIXED AMMUNITION.

A large and complete stock of these celebrated arms constantly on hand, to wit:

Repeating Sporting Rifles—Oiled Stocks.

Repeating Sporting Rifles—Varnished Stocks.

Gold, Silver and Nickle-plated Rifles—beautifully Engraved.

Repeating Carbines—Oiled Stocks.

Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.

Muskets—Angular or Sword Bayonets.

Full stock constantly on hand of all the different parts of the Winchester Arms.

Cartridges in cases (Brand H), manufactured by the W. R. A. Co. expressly for their arms.

A full and complete stock of the above named merchandise always on hand and for sale by

JOHN SKINKER, Sole Agent,
5v24-5m-1amr 108 Battery street, S. F.

H & L AXLE GREASE.

The attention of Teamstere, Contractors and others, is called to the very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricante calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

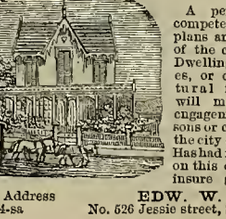
LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other. 3v24-cowr

To Parties About Building.



A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. Has had full experience on this coast, and can insure good satisfaction. Address

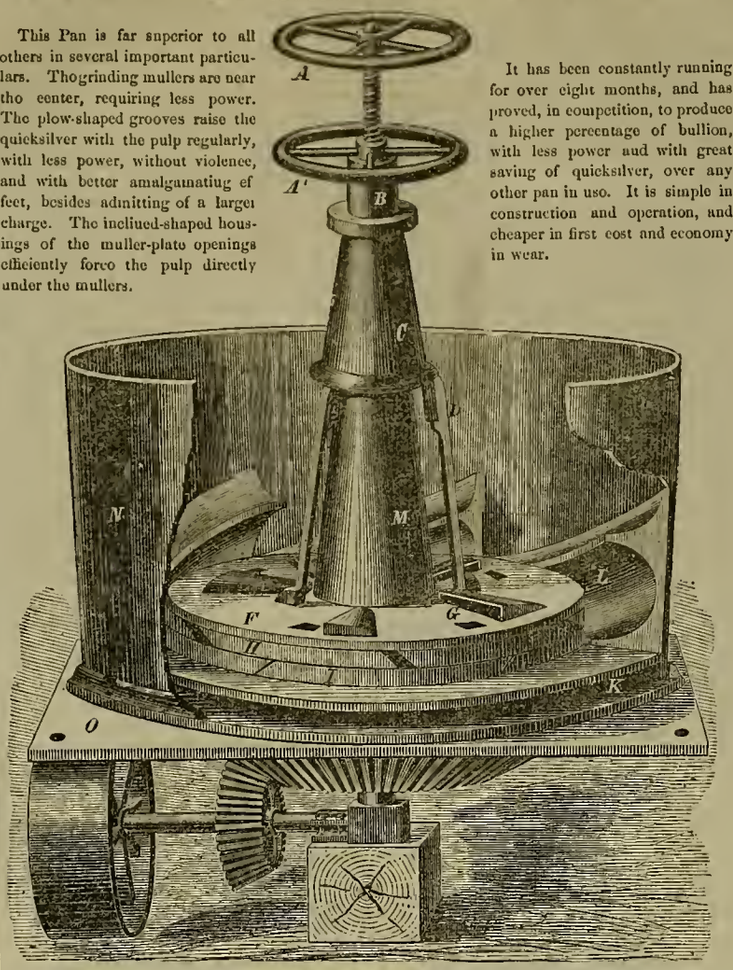
STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufacturers at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amtf

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

THE TANITE COMPANY,

STROUDSBURG, PA.,
Sole Manufacturers of
THE TANITE EMERY WHEEL,
And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $113 each.

Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

TEACKLE M. Co., May 1st.—Location in Gold Hill M. District, Nevada. Capital stock, $2,800,000, in 28,000 shares. Trustees: E. B. Dorsey, James A. Pritchard, S. A. Raymond, James L. King and James Flanagan.

HARTFORD M. Co., May 1st.—Location in Gold Hill M. District, Nevada. Capital stock, $2,500,000, in 25,000 shares. Trustees: J. P. Jones, Nathan Solomon, E. M. Hall, Lawson J. Adams and Edmond Patton.

A SWEDISH Arctic Exploring party has recently brought some remarkable meteoric stones from Greenland, the largest of which weighs 12 tons, and has a cross section of 42 square feet in the largest part.

THE Rock Island Mining Company, whoso property is in Storey Co., Nev., have obtained a patent to their mine, and are about to place their stock in the market.

Ores Sampled.

Tbe following lots of ore were sampled hy J. W. Thurman, 413 and 415 Mission street during the month of April: Two lots of 2,108, and 165 sacks of copper ore from Battle Mountain, Nev., and 121 sacks of lead and silver ore from same place; 138 sacks of lead and silver ore from Mexico; 314 sacks of antimony, Mill City; from Arizona 31 sacks silver ore from Prescott District, 40 and 75 sacks from Wallapai, and 24 from Clark District. From Arizona mine, Nevada, 58 sacks silver ore and 170 sacks from tbe Eureka mine, making in all 3,344 sacks.

One huudred and fifty-six tons of copper ore assaying from 26 to 30 per cent. was shipped to Liverpool on owner'e account; 160 tons of silver ore assaying from $200 to $1,650 per tou was hought by Messrs. Selby & Co., and Cross & Co. Silver ores have been coming in freely from Arizona, aud if we only had quick and cheap transportation from there we would have thousands of tons of good ores that would assay from $300 to $2,500 per ton. Freight is so high and it is so long before the miners can get their returns that they feel unwilling to make shipments. The freight at this time costs them about $100 per ton, and it takes from two to three months from the time the ore starts from the mines before it can reach San Francisco. As soon as the ores arrive and can be crushed and sampled, the shippers and Messrs. Selby & Co. stand ready to buy and pay the highest cash price for all the ores they can get. The wonder is that they ship at all under such disadvantageous circumstances, and a proof of tbe richness of the mines is evident from the fact of their making any profit at such high rates of freight, etc.

Copper ores are very scarce at this time and are hadly wanted both for shipment and for the purpose of manufacturing into bluestone here. Parties who can ship such ores to this market should do so as soon as possible ae the present prices will pay them well for all they can furnish. This ie a good outlook for our long neglected copper mines and owners will no doubt get out ore as rapidly ae possible.

Mining Accidents.

John A. Coulter, a miner, employed in the Kingston mine, on Pauaca Flat, was killed recently, by falling from a bucket in the shaft. He had put in some blasts and after lightiug the fuses gave the signal to hoist. On the way up the gear became entangled and the men could not raise him except by pulling baud over hand. While doing so one of the blasts went off and he fell 130 feet and broke his neck.

A man working at the Saratoga mine, says the Reese River *Reveille*, fell in such a manner recently, that a moving car struck him and fractured his jaw in two places,

John McCabe, working in the Murphy mine, Ophir Cañon, Nev., was instantly killed last week, by a car falling upon him and throwing him down an incline.

The Quincy *National* says that three men named L. P. Maynard, Lorenzo Serry and Fred Knoble, were carried over the dumps of the Taylor Hill claim recently. There is a perpendicular fall of 150 feet from the mouth to the flume.

The Virginia *Enterprise* records the death of James Roach, a miner employed in the 1200-ft. level of the Crown Point mine. He was struck on the head hy a piece of timber which was being sent down the chute.

THE street cars of London are differently arranged from those in use here; they have seats inside and out. The track is a flat strip of iron, with a groove for the flange of the wheel to run in. This strip offers no obstacle to vehicles, as it is exactly level with the pavement, not sunk, and does away with some of the objections of our system.

RICHARD H. BUEL, Consulting Mechanical Engineer, 7 Warren Street, New York. Advice and assistance given to those who desire to invest funds in meritorious and valuable Patent Rights. Machinery of all kinds bought and sold. Unusual facilities for testing engines, boilers and other machinery. I refer particularly to Professor R. H. Thurston, of the Stevene Institute of Technology, who has consented to aeeociate himeelf with me in consultation on matters of special importance. 10v24-13t

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alleghany Consolidated Gold Mining Company—Location of works, Alleghany, Sierra County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of April, 1872, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, 37 New Merchants' Exchange, California street. Any stock on which said assessment shall remain unpaid on the third day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 37 (third floor), New Merchants' Exchange, California street, San Francisco. ma4-4t

Francis Mining Company--Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. CRONISE, Secretary.

Office, 409 California street, San Francisco, Cal.

Ingomar Silver Mining Company—Location of works, Ely Mining District, Lincoln County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 2d day of April, 1872, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 24th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the 31st day of May, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

CHAS. S. NEAL, Secretary.

Office, Room 21, Hayward's Building, No. 419 California street, San Francisco, California. np6-4t

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of April, 1872, an assessment of Three Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 27th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 17th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. Union Gold Mining Company.---Location of works, Howland Flat, Sierra county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of April, 1872, an assessment of one dollar ($1.00) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 22, Merchants' Exchange Building, California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 13th day of May, 1872, shall be deemed delinquent, and will be duly adve tised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 3d day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DURBROW Secretary.

Office—Room No. 22, Merchants' Exchange Building, California street, San Francisco, California. ap13-td

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply this name of "Worcestershire Sance" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine ie to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire saucc, upon the wrrspper and labels of which the names of Lea and Perrins havs been forgcd, L. and P. give notice that they have furnished their correspondents with power of ttorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which theoir right may be infringed.

Ask for LEA & PERRINS' Sauce, and see nsme on wrapper, lahel, hottle snd stopper

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thns enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are servicoable in protecting the wine from injury, and insuring its genuineness.

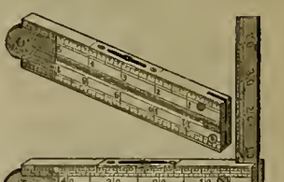
MANUFACTORIES:—WHARF ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

PURCHASERS pleass say advertissd in SCIENTIFIC PRESS.

STEPHENS & CO.,

MANUFACTURERS OF

U. S. STANDARD BOXWOOD AND IVORY RULES.



ALSO EXCLUSIVE MANUFACTURERS OF

L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.

The Square is adjustahis, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom reqnired.

In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.

"By the use of one of these, a builder, rasson, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful nnd cheap form."—*Scientific American.*

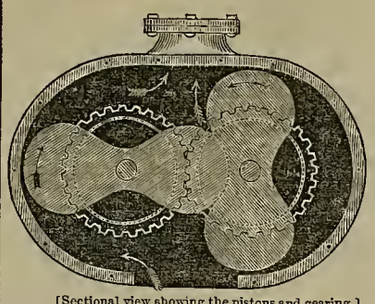
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

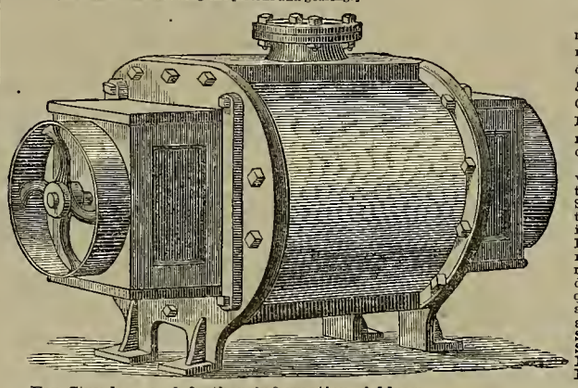
Stockton, Cal.



[Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

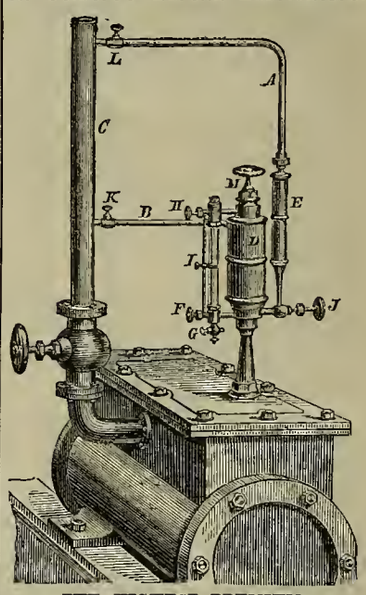
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the pistons will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

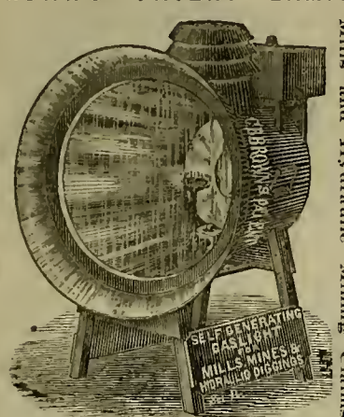
BROWN'S PATENT LAMP.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

For further particulars address

C. B. BROWN,

7v24-t Placerville, Cal.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapidity pulverizing and amalgameting ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump *has exceeded our expectation*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.

Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, January 19th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (160 feet deep) with perfect ease, and is only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations. Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *It suits us in every respect.* Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

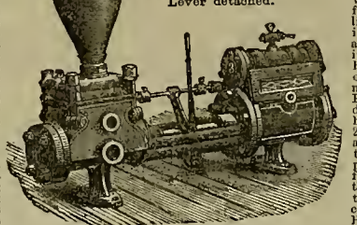
BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it is *at present six feet under water*, yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cams, nor complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the exhibition of the Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.



It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞ Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞ Send for circular and prices.

6v24-eowbp

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

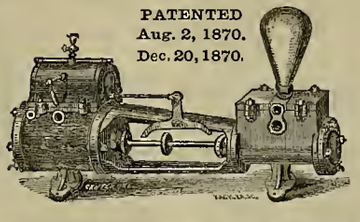
"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, CHAS. R. STEIGER, W. EPPELSHEIMER, H. B. ANGELL, MELVILLE ATWOOD."

11v3-ewbp

THE SELDEN PUMP.

PATENTED
Aug. 2, 1870.
Dec. 20, 1870.



Combines Simplicity and Durability to a Remarkable Degree.

Its parts are easy of access, and it is adapted to all purposes for which Pumps are used—especially Mining.

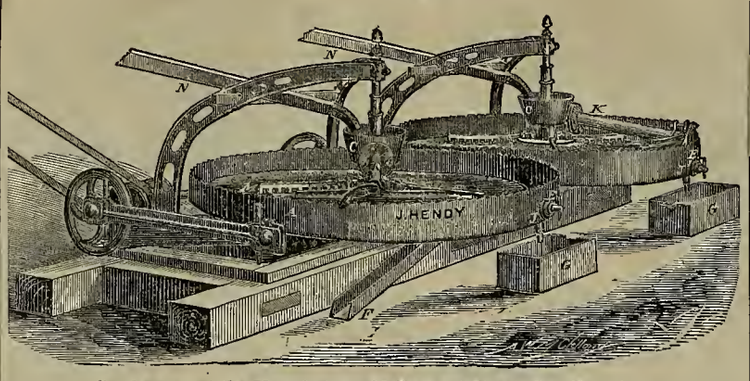
HENDY'S

LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed is the only true and mechanical one for the purpose of concentration.

Centrifugal Force and Gravitation,

Combined as they are in this Machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that its proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

The proprietor has still further improved the machine, making it stronger and still more durable. He flatters himself that the added advantages leave nothing further to be desired as the perfection of the machine.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in use for over four years.

EMPIRE MILL. (8 Concentrators)	Grass Valley, Nevada County.

VOLUME XXIV. Number 19.

Sutter's Mill—Where Gold was First Discovered.

The accompanying illnstration will call many to the minds of pioneers of California, pleasant reminiscences of those favored and long to-be-rememberod days, the days of "49." It represents Snttor's mill, where the first practical discovery of gold was mado, which led to the "excitement" of 1849 and the immonse influx of people from all parts of tho world to our shores, ultimately rosnlting in the opening of the gold fields of the Siorras, the civilization and settlement of our glorious State; the discovery of the nnbonnded field of mineral conntry on tho Pacifio Coast; and the development of the nnmberless resonrces of mnoh-favored California, as well as adjacent States and Territories. Sutter's mill was sitnated on the Sonth Fork of the American river, in El Dorado time Connty, for a time known as the "Empire County" of the State. The story of the discovery of gold by James W. Marshall is briefly as follows:

Marshall was building a sawmill, nnder contraot, for John A. Sutter, at the locality above mentioned, and, on the 19th of Jannary, 1848, turned the water into the race. The swift current of the race washed away considerable earthy matter, exposing numerous ooarse particles of gold, one of which, when the water ran clear, was picked up by Marshall. He gave the piece to Mrs. Weimer, the wife of his partner, who was at the time cooking for the men, and, according to Samuel Brannan, Esq., in a recent letter to the Calistoga *Tribune*, it is still in her possession in Santa Barbara. Although Marshall was confident that he had discovered gold, he knew nothing of either chemistry or gold mining, so he could not prove the nature of the metal or tell how to obtain it in paying qnantities. He went down to the mill, however, every morning to look for more pieces, but the men with him having no faith in the value of his discovery, paid little attention to what he was doing. His specimens continued to accumulate, and about the middle of Febrnary, Mr. Bennet, one of the party at the mill, came down to San Francisco to learn whether the metal was really gold or not.

A man named Isaac Humphrey, who had washed gold in Goorgia, immediately recognized it as the "pure stuff." He went back to Sntter's Mill (or Coloma) with Bennett, where they arrived on the 7th of March. A few of the men were indolently hunting for the gold, but without much faith as to its really being such, and work at the mill was going on as if there were none in the neighborhood. After Humphrey had washed a pan of dirt from the bottom of the mill race in the place where Marshall had found his specimens, he became convincod that the mines were far richer than any he had ever seen.

A rocker was made and the searoh began in earnest. The other men at the mill seeing his success and confidence in the discovery immediately quit work, made rockers for thomselves and started to work hunting for gold, everything else being abandoned.

We give herewith an illustration of the mill from a painting by Chas. Nahl, belonging to Mr. A. Roman, of this city, which was taken from a sketch made in 1851. It was located in a beantiful valley on the South Fork of the American River. At the time of discovery Coloma contained a double log cabin, and about eighteen persons, exclusive of Indians. From that time to the present the place has experienced the usual vicissitude incident to a mining camp where the population is always changing.

SUTTER'S MILL—WHERE GOLD WAS FIRST DISCOVERED.

The mill was, we believe, never completed, aud the sketoh shows it as it was left at that time. Among the persons who were there at the time of the discovery, were J. W. Marshall, E. Pierson, John Weimer, Peter Weimer, W. H. Scott, A. Stephens, H. Bigler and C. Bennet.

In the middle of March, P. B. Reading, visiting Sutter's Fort, heard of the gold, and on going to Coloma and seeing the similarity of the formation and that of his own ranch, near the head of the Sacramento Valley, started back, and in a few weeks was washing gold on the bars of Clear Creek, nearly 200 miles northwest from Coloma.

John Bidwell also came to Coloma, and, returning with a party of Indians from his ranch, began washing gold on the bars of Feather River, 75 miles from Coloma. Some of the men became dissatisfied because Marshall, Weimer, Bennett and Capt. Sutter claimed the right of discovery, and chargod all who worked thore 10 per cent., so they prospected for themselves, and fonnd good diggings about 25 miles down tho river, at a place which has since been known as Mormon Island. By this means the mines were immediately opened at several different points, proving, in a measure, their extent and value.

The first printed notice of the discovery of gold appeared in the California *Star*, which was published in San Francisco, on the 15th of March, 1858. It was as follows: "In the newly made race-way of the saw-mill recently erected by Captain Sutter, on the American Fork, gold has been found in considerable quantities. One person brought $30 to New Helvetia, gathered there in a short time."

On the 29th of May the same paper announcing the suspension of its publication, said: "The whole country, from San Francisco to Los Angeles, and from the sea-shore to the base of the Sierra Nevadas resound with the sordid cry of gold! gold! gold! while the field is left half planted, the house half built, and everything neglected but the manufacture of picks and shovels, and the means of transportation to the spot where one man obtained $128 worth of the real stuff in one day's washing; and the average for all concerned is $20 per diem."

Immediately after this commenced the great "'49 rush," with which most of onr readers are acqnainted.

There has been considerable discussion as to Marshall's claims to being the first discoverer of gold in California at Sutter's Mill, and a number of persons have presented themselves as candidates for the honor. Geo. M. Evans in a recent letter to the Oregon *Bulletin*, claims that he, Stearns and T. Sirrine were the discoverers, and Sam Brannan, Esq., was the first one who made the fact publicly known. The latter gentleman seeing the letter referred to, republished in the Calistoga *Tribune*, denies the statement by giving substantially tho facts above mentioned to the effect that it was James W. Marshall, and says that there are many living witnesses to testify to their correctness. It is generally conceded that Marshall was the first practical discoverer of gold in California, although its existence in this country was known for some years before. The Indians had several times bronght small quantities to the missions, bnt no steps were ever taken to ascertain the localities or work the mines.

In Hakluyt's acconnt of the visit of Sir Francis Drake to the California Coast, in 1579, the following statement occurs concerning its mineral wealth. "There is no part of the earth here to be takeu up wherein there is not a reasonable quantity of silver and gold." There is little reason to believe, however, that he verified this statement. But Alexander Forbes, in 1835 wrote, "no minerals of particular importance have yet been fonnd in Upper California nor any ores of metals," and speaking of Hijar's emigrants who arrived in in 1833, he said that "there were among them goldsmiths proceeding to a country where there was no gold." There are reports that silver was discovered in Alizal, Monterey Co., in 1802, and gold in San Isidro, San Diego Co., in 1822. In a collection of documents relative to the department of California by Manuel Castañares, a letter written by him to the Mexican Government in 1844, speaks of a deposit of gold discovered in the previous year about 45 miles from Los Angeles. He says that there were in circulation in Los Angeles about 2,000 ounces of gold taken from these deposits when he left for Mexico.

Prof. Dana, the geologist of Wilke's Exploring Expedition, says gold rooks and veins of quartz were observed by him in 1842 near the Umpqua river in Oregon, and pebbles from similar rooks along tho shores of the Sacramento river, and when speaking of the localities of gold, says that it may be found in "California between the Sierra Nevada and the Sacramento and San Joaquin rivers".

The State Legislature have established Marshall's claims as the first discoverer by giving him a pension and although the credit has been given by various persons to various others, even to "Indian Jim, a Digger Indian" it is likely that Marshall's name will go down to posterity as the man whose discovery resulted in the great "California excitement of 1849."

CORRESPONDENCE.

The Mines of Utah.

[Written for the SCIENTIFIC PRESS.]

EDITORS PRESS:—As the mines of Utah are at present attracting so much attention both at home and abroad, it may be interesting to your readers to learn some items in regard to the principal mines, and the districts in which they are situated. There is little doubt in the minds of those whose knowledge and experience in such matters entitle them to be considered competent judges, that the vast mineral treasures already discovered in these mountains are but an iota compared to the wealth still hidden in the bowels of the earth, and that the Kingdom of the Latter Day Saints is destined to become the long sought for El Dorado of the great West. New discoveries are continually being made which tend to corroborate this opinion, and the amount of

Foreign Capital

Which is pouring in is conclusive proof that business men abroad have confidence that mining in Utah is not a mere temporary excitement, but will be a lucrative and permanent branch of industry. In addition to the already computed $3,000,000 of Eastern and Western, and $7,000,000 of English capital invested in Utah mines, a large increase is confidently expected this spring, and it is rumored that financiers of other European countries are also going to enter the field. Great fortunes have already been made, and it is not presumptive to hope that many more will be made, even before the close of the present season, which is just now opening. Another advantage which we have over other mining countries, is our agricultural resources, which are adequate to a much larger population than Utah yet has, and peace reigns in the Territory, notwithstanding the false representations that life and property are insecure. Life and property are as safe here as in any part of the United States.

According to Froiseth's new mining and sectional map of Utah, there are forty-seven organized

Mining Districts

In the Territority, many of which have been organized during the past year. In some of these districts very little work has been done the past winter, on account of severe weather and unusual deep snows in the cañons, while in others the work of development has been vigorously pushed forward in spite of "wind and weather." In many districts it has been impossible to continue work, except upon those mines which were already partially developed, and those lodes which were only prospected have been obliged to lie quietly under the snow until the advent of spring weather. In the

Cottonwood Canons

The snow fell incessantly for ten to fifteen days in succession, thus occasioning well grounded fears of some snow-slides, one or two of which have occurred in Little Cottonwood. Notwithstanding these drawbacks, considerable work bas been done in both these districts, and the mines, especially those in the vicinity of Emma Hill, look very promising. The celebrated "Emma" has been turning out immense quantities of rich ore all winter, and there are other lodes which it is thought will be equally valuable when fully developed. Among the

Most Prominent Mines

of Little Cottonwood are the Flag Staff, Davenport, North Star, Savage, Wandering Boy, Montezuma, Lexington, Dexter and Mountain Queen, while in Big Cottonwood are the Highland Chief, Prince of Wales, Wellington, Reed & Benson, and other finely developed mines too numerous to mention. Some work has also been done in Uintah, Snake, Howland, Silver Lake and

American Fork Districts

With good success. This last named district is very promising and contains a large number of excellent mines, from one of which, the "Miller," immense bodies of argentiferous galena have been taken out. The Miller is owned by Vanderbilt of New York and R. N. Baskin of this city, under the organization of the Sultana Smelting Company, who have erected two furnaces at a place called Forest City, about two miles from the mine, which has been connected with a tramway for the transportation of ore direct to the smelters. In the same cañon opposite from the Miller, are the Mary Ellen and the Live Yankee. On these two mines three shafts have been sunk, besides a tunnel commenced, and an open cut, and quantities of rich ore have been taken out containing lead, silver and gold in paying quantities. The Pittsburgh is also developing finely and there are many other mines in this camp which are turning out fine bodies of ore. Perhaps one of the most promising districts in the Territory is

Camp Floyd.

This camp has the advantage over many others, in the miners being able to work all winter with little or no interruption from the snow. During the past winter the work of developing has been pushed forward with great vigor and is still being continued showing a determination on the part of the miners to maintain the prosperous reputation of this thriving camp. Business at present is very active which is based upon the actual merits of the mines and not upon wild speculation. A large 20-stamp quartz mill, built under the supervision of Captain E. H. Shaw, the general manager of the Camp Floyd Silver Mining Company (English) is now fast approaching completion, and will be in running order by May 15th. The bed of a tramway from the mill site to the mines, has recently been finished, and the laying of the track will be immediately commenced.

A New York party who lately purchased the Silver Circle, Wandering Boy and Ruby locations, in this camp, for which they paid $75,000, have also purchased a mill-site adjoining and below the mill of the camp Floyd Co. They are now vigorously at work developing their property and have already struck a rich body of ore. The mines are all situated within a radius of two miles from Lewiston, the most prominent of which may be considered the Sparrow Hawk. Here are about sixty men employed upon this great mine, sinking shafts and blasting out in the open cuts and tunnels, and it is turning out large bodies of rich ore from their different places. Recently two new places were discovered containing immense deposits of rich sulphurets of silver and horn silver, and if present indications are not very deceptive, the Sparrow Hawk will be a formidable rival in fame to the world renowned "Emma." There is, however, this difference between the mines, that the ore of the Emma is argentiferous galena, while the Sparrow Hawk is equally rich in almost inexhaustible stores of milling quartz and sulphuret ores. The Last Chance and Marion, two other very good mines as well as the Sparrow Hawk are owned by the Camp Floyd Silver Mining Co.

Other Prominent Mines.

There are so many mines in this district whose value have been established beyond a doubt during the past winter by actual development, that it is impossible to particularize, and do justice to all in one letter; therefore a brief mention of the most promising must suffice. The Camp Douglas, which bids fair to be as good as the Sparrow Hawk, has already a shaft of fifty-nine feet in depth, besides a drift of five feet in addition, which is to be continued in an easterly and westerly direction. From the surface to the present depth of shaft there is a body of vein matter the entire depth, and the showings, some twenty feet from the surface are not surpassed by any yet met with in the mines of this district. This mine is owned by Gen. Morrow & Co., the commandant of Fort Douglas Military Post. The Morrow Lode, owned by the same company, situated one mile distant from the Mormon Chief, has a shaft fifty-three feet deep, which is prospecting very well; and judging from the large outcroppings exposed to view upon the surface, this mine must prove very rich when further developed. South and west of the Sparrow Hawk are several good mines, which are very promising. Among these are the Peerless, Delaware, Elk Horn, Antelope and Red Eagle, while in a northerly direction are found the Grecian Bend, Silver Circle, Wandering Boy, Star of the West, America and Silver Cloud. Among the mines worthy of note in the

Ophir District

Are the Hidden Treasure, Silver Shield, Velocipede, Silver Chief, San Joaquin, Shamrock, Mountain Tiger, Nahoh, Mountain Lion, Monarch, Zella, Hard to Beat, and Sweetwater, all of which will be vigorously worked this season.

In the Stockton District,

Are many notable mines, among which may be mentioned the Silver King, Legal Tender, Metropolitan, Grand Cross, Great Basin and Josephine. Work on most of these mines have been suspended during the winter, but will soon be actively resumed. There is already a furnace built for this camp, on the shores of Rush Lake, about one mile from the town of Stockton, and two additional furnaces are being erected this season, one of these by Jacobs & Co., who are having the machinery brought across Great Salt Lake by the steamer from Corinne. A quartz mill has also been contracted for, and when all this machinery for the reduction of the precious metal gets fully in motion, Stockton will not be behind any of the mining camps in Utah.

The successful establishment of the Pioneer Mills in East Cañon by the Walker Bros. and the opening of a market for ores at Reno prices, has imparted new life to the whole district and henceforth we may expect substantial results. The Akin furnace is pronounced a success, which is nothing less than success for the whole district. In the

West Mountain or Bingham District,

There are many mines worthy of notice; among these are the Winnemuck mine, the Pioneer of the camp, which is proving very profitable to its lucky owners. next comes the Galena, Dixon, Yosemite, George, Merrimac, Vespasian, Fliess, Ely, Portland, Dartmotb, and Red Warrior, all of these are developing finely, and a number of these will unquestionably sell before the close of the season at a renumerative figure to the owners who have had to toil hard in opening them up. Travel to Bingham is on the increase, owing mainly to the discovery of rich silver ore in Butterfield cañon which adjoins Bingham. A car load of ore worth $10,000 came in lately, to the city; this is sufficient to attract the prospectors. The Bingham gold mines are are also expected to yield largely this season as the mines are supplied in many instances with hydraulic machinery.

The Star District,

Some 250 miles south of this city, has lately been attracting considerable attention, not only among Utah miners, but those in Nevada and California. This district was discovered two years ago, but did not create any excitement whatever. Last fall some large and very rich ledges were discovered, which have developed into splendid mines, among the leading of which are the Independence, London, Liverpool, Pitney, Taylor, Ruby, Mars, Franklin and Eclipse. The character of the mineral rock is the same as that of Pioche, and the ledges are clearly traceable for a mile and a half under the hill. Those who are interested in this district seem to think, that it will yet prove one of the richest in the Territory. Within a radius of twenty-five miles from Star District, are located the Washington, Granite, Lincoln, and Beaver districts in Beaver County; the Ohio and Warsaw districts, near the Sevier river in Pine County. All these districts show good indications of being rich in minerals.

Did time and space permit I might particularize in regard to a number of other districts, which are worthy of note, as well as those which I have mentioned. I have also been obliged to omit both the description and names of many prominent mines, but perhaps I may have an opportunity to speak of these at some future time.

"WAHSATCH."

Salt Lake City, Utah, April 22, 1872.

Craft-Schools Wanted.

To remedy the aimlessness and unfitness for life with which our education leaves our youth, we need more craft-schools, where boys can become practical engineers, chemists, printers, machinists, and even farmers. The machinist would be none the worst if he should spend his evenings over Euclid instead of lager; the blacksmith, if he knew how to drive home and clinch an argument in metaphysics as skillfully as a horse-shoe nail; or the dentist, if he could extract bidden Greek roots with the same facility as grumbling molars. Educated men would dignify any of these employments, and make them sought and not shunned by those worthy to fill them. A man who wants to run an engine ought to be educated for his business, just as much as a lawyer for his profession. We are a patient and long-suffering people, or we would never permit ourselves to be blown up by hundreds by ignorant engineers, who know nothing more of the monsters which they control than enough to feed them with wood and water, and oil up their creaking joints; or suffer ourselves to be sent to our graves by striplings in short jackets, who give us arsenic for paregoric, and strychnine for the elixir of life. The time is coming, and we trust is not far distant, when all these positions of responsibility will be filled by men of education, and can he filled by none others; when ignoramuses will he obliged either to fit themselves for their proposed labors, or seek other employments.—*Scribner.*

Lead in Oregon.

The Portland *Oregonian* says: Several specimens of lead ore, discovered near the foot of the Cascades in Linn County, have been sent to this city for analysis by J. H. Fisk, assayer. From him we learn that after testing the ore he found it to contain about 60 per cent. of pure lead and also a very fair proportion of silver. According to the results of the assay, 2,000 pounds will produce 1,200 pounds of lead, and average $18 in silver. This is regarded as a very generous yield of these metals. This mine is of recent discovery. It is known as the Washington Lode. A joint-stock company has been lately incorporated in this city for the purpose of engaging in the development of these valuable mines. Mr. Fisk informs us that almost inexhaustible quantities of this same ore, with all the indications of as bounteous a yield of the same metals, have been discovered in the vicinity of Tillamook.

Captain Corno, of the Mila Boud, has contracted to bring over on his return, to this city, a large quantity of this ore. It will be analyzed here, and, if attended with satisfactory results, run into bars and sent to Europe. All these things demonstrate the fact that Oregon abounds in all the rich mineral stores which are essential in building up and developing one of the most promising States in the Union. Capital and men of energy and enterprise are what is wanted to reveal and turn into profitable channels these latent sources of a State's permanent wealth.

Sleep and Lodging.

Next to food comes lodging. To secure a comfortable bed is to the greater part of mankind still a desideratum—and yet any man of ordinary capacity may himself make the foundation for an excellent one with a few hours' labor. When we reflect on the importance of sleep, the time thus spent will not appear wasted. Without sleep insanity is certain. Nearly one-third of life must be passed in sleep. Why we are thus constituted is not to this present purpose. What relation this hours of sleep hold to the inclination of the earth's axis, or if the inhabitants of the planet Mars sleep, we shall not stop now to inquire. It is enough, with Sancho Panza, to invoke blessings on the man that invented sleep—"it covers one so like a blanket," "tired nature's sweet restorer, balmy sleep," descending as it does "like tired eyelids over tired eyes."

How strange it is that in this decade of the nineteenth century, we should first be able to compel the attendance, certainly and securely, of sleep—to realize the truth of the fable of Lethean waters. Opium gave us this boon at the expense of a feverish reaction; morphine promised it, but failed in the performance; chloroform gave it, but at a serious risk. How suddenly chloral has come into use! Almost as quickly as the shades of night, which it so aptly represents, has this invention crossed the Atlantic on downy pinions to visit the abodes of American care and distracting brain labor. This is the veritable angel of sleep. Of the bed-bottoms conducive to sleep: The foundation of the superstructure should be firm, open, elastic, noiseless; affording no barbor to insect denizens. It is of no consequence to the prominent hip-bones and short ribs of an emaciated sleeper, whether they are a few inches more or less distant from the floor; but it is of consequence that the prominent portions of the body should find for themselves corresponding depressions in the supporting medium, thus extending the surface of contact and avoiding chafing.—*Ex*

LIME IN THE HAY-MOW.—The New York *World* in one of its issues last fall published a successful experiment in saving damp hay by a little lime scattered over it when mowed. The writer kept a cow and had a patch of clover which was always cut in full bloom to save its nutriment. Although sweated in cock it was very difficult to make it dry enough to mow; but by scattering over it as it was stowed away a few quarts of dry air slaked lime it became dry and entirely free from mildew. He told many farmers of the experiment, but none tried it. It was too much like book-farming. But it is no wonder that the old fashioned farmers have such a horror of book-farming, as heretofore the most of those who followed it, continues the writer, have either failed in practice, or carried on their farming at so great an expense that the increase never paid the malting.

Mechanical Progress.

The Physical Properties of Steel.

In continning onr extracts from the recently pnblished work of M. S. Graner, of the Paris School of Mines, it may be remarked that on the authority of Caron, that it has beeu successfully demoustrated that hammering steel *hot* produces the samo effect as tempering—causing a coubinatiou of the carbon and iron. Graner, the author from which wo aro gleaning, thiuks both hammering and tempering prevents the separation of the two substauces already combined.

Peculiarities of Bessemer Steel.

It is a fact easy of demonstration that iu the Bessemer steels, made in Swedeu and Austria, hardness aud the susceptibility of heiug tempered depeud ossentially upou the proportion of carbon held in solution.

In Sweden nine grades of Bessemer steel are distinguished according to their hardness, estimated by the tempering power. Thoy are designated by the numbers 1, 1¼, 2, 2¼, etc., as high as 5, iu passing from the hardest to the softest, and, at the works of Siljanfors, analysis has shown very uear tho following proportious of carbon:

No. 1	2·00	per cent. carbon.
" 1¼	1·75	" "
" 2	1·50	" "
" 2¼	1·25	" "
" 3	1·00	" "
" 3¼	0·75	" "
" 4	0·50	" "
" 4¼	0·25	" "
" 5	0·05	" "

No. I. Links white pig metal with the hardest steel; it may, with difficulty, be forged, and does not weld.

No. 1¼. Forges tolerably well, but does not weld.

No. 2. Forges well; but does not weld.

No. 2¼. Forges well and commences to weld, although with difficulty.

No. 3. Forges very well, and may be welded in the hands of a skillful workman. It is hard steel.

No. 3¼. Forges very well and welds readily. It is ordinary steel.

No. 4. Both forges and welds readily. It is aoft steel.

No. 4¼. Forges and welds perfectly, but has slight tempering power. It is hard or granular iron.

No. 5. Forges and welds perfectly, bnt has no tempering power. It is cast wrought iron, or homogeneous metal.

It will be observed that the proportions of carbon above quoted have no absolute power as regards tbe tempering power and the facility with which the irons may be welded or drawn ont. The purer a steel is, the greater may be its proportion of carbon without destroying its welding and forging power. The greater part of foreign snbstances, excepting special metals, anch as tungsten, titaninm, nickel, etc., render eteel short and destroys its welding power when the carbon exceeds a certain limit. All things being equal, the limit in question is lower according as the foreign substances are more abnndant. This being the case, Bessemer steels made in France, and especially in England, mnst in general contain less carbon than Swedish steels. They are, in fact, made from pig iron of less purity; Bessemer steel, in England, rarely contains carbon enough to admit of being tempered, and can hardly be called steel.

When the proportion of carbon is increased the product becomes more or less short.

In Anstria, as in Swedeu, where very pnre pig irons are treated in the Bessemer process, superior prodncts are likewise obtained. Tunner, the eminent metallurgist of Leoben, has adopted a system of classification slightly differing from the Swedish. He has, however, omitted the two first Swedish numbers, which belong rather to white pig iron, and has replaced the half numbers by entire numbers increasing from I to 7.

According to him the theoretical classification is ae follows:

No. I. Containing I·5 per cent. of carbon, is malleable bnt yet not weldable steel. It corresponds to No. 2 of the Swedish scale.

No. 2. Containing I·25 per cent. of carbon, is malleable steel, but difficult to weld.

No. 3. Containing 1·00 per cent. of carbon, is very malleable steel, which may be welded by a skillful workmau. It is hard steel.

No. 4. Containing 0·75 per cent. of carbon, is very malleable steol, easily welded. It is ordinary steel.

No. 5. Containing 0·50 per cent. of carbon, is at the same time very malleable and very easily welded. It is mild steel.

No. 6. Containing 0·25 per cent. of carbon. It is granular iron, which is tempered with difficnlty.

No. 7. Containing 0·05 per cent. of carbon, is homogeneous iron, which cannot he tempered.

When the fining is carried too far, a softer metal than No. 7 is obtained. It is *short*, without tenacity. It is the *burnt iron* of the blacksmiths; according to Fremy, an oxidized and not a nitrogenized iron.

A New Solder Wanted.—The Prussian Society for the Promotion of Industrial Advancement at Berlin offer as a prize a silver medal, or its value, and the sum of 1875f. to the inventor of a yellow solder possessing the properties and quality of ordinary tin solder, and to be naed for soldering brass or similar alloys so that the seams will not be visible.

Early Iron Making in England.

A discovery of unusual interest has just taken place at Merthyr, which throws a little light on the mode, or one of the earliest modes, of mskiug irou. At the back of a row of houses, in Pontmorlais, built evidently withiu a few feet frou a long bank of earth, sufficieut soil from this bout had been sliced away to admit of drains, gardeus, aud other accommodations, leaving the rest intact, aud that this remainder was of old deposit may be inferred from the fact that the earliest tramway, for which an Act of Parliament was obtaiuod in 1804, and on which tramway Trevithick ran his first locomotive, passed over this bank.

In the rear of one of the houses occupied by Mr. John Emerys Jones, a sculptor, aud a man of more thau ordinary iutelligeuce, a further portion of this slope was cut off lately by Mr. Jones, and in the progress of the labor he came upon several huge bones and a vessel of baked fire-clay, much iu appearance like a crucible. Great care waa at ouce taken in the exhumatiou, aud the character of the discovery solved itself into the following:—In the centre of a circle of red ashes, placed on a pitched ground, was a circular vessel of baked fire-clay, I foot in diameter and ¾ of an iuch wider at the bottom than at the top. This was evenly lined within, aud at the bottom, which bore traces of great heat, were the remains of iron ciuder, lime and partially fused bones. By the side of this were pieces of rusty iron and a larger collection of bones. evidently of animals.

The pieces of iron wheu fitted together appeared much like a "tuyero" for conveying blast, and near this was a wall built a little higher than the vessel, which, when examined by practical men, supplied the key to this interesting discovery. It would seem the contrivance was an early one for iron making or for making steel. The vessel would apparently be filled with iron ore, coal, bones supplying sulphato of lime; limestone for yielding carbonate of lime, and, from the existeuce of mortared bricks in the vicinity, the vessel would next be bricked up, leaving an aperture for the blast. It is supposed that a circle of coal fire would then be brought to act on tbe vessel, aud wheu a certain degree of heat had been attained a fire kindled within, and the blast brought to bear npon it through the tuyere from a bellows erected on the wall. The vessel would yield but about fifty pounds weight of iron, a fact which hints at very primitive times in iron making. If the contrivance—certainly long prior to the Bessemer era—were for blowing in the oxygen and making steel, the discovery is even of still greater interest.

Utilization of Slags.—We referred a few weeks ago to the so-called mineral wool, produced by throwing a steam blast upon the stream of molten slag as it issues from the furnace; other means of making use of this material are also adopted. In England the slag is generally broken up by stonebreakers, and used for metalling roads. The Bessemer slags from hæmatite furnaces, on account of the large quantity of lime which they contain, make excellent concrete. They are also peculiarly suitable *for manuring potatoes and barley*, as they fall to powder under the action of the atmosphere, yielding up their silica and lime in a very finely divided state. At the blast furnaces of Osnabruck, Hanover, the slag is broken up by a method wbich, under some circumstances, might advantageously be adopted elsewhere. The molten slag is allowed to fall from a height of about eight feet, into water, and is thus formed into a large bean-shaped gravel. From the water tank it is lifted by "Jacob's ladders," and is conveyed away as fast as it is produced, and largely used for ballasting railways, or for other road purposes.

Phosphorized Bronze for Guns.—The question of the use of pbosphorized bronze as a material for guns is now engaging the attention of many of the European powers. For some time past important trials have been going on with guns of this material in Prussia, and, we understand, with the most satisfactory results. The Swiss Government have under trial a breech-loader of phospborized bronze; the Dutch Government a muzzle-loader; the Italian Government, haviug repeated the statical tests which were applied to this material by Montefiori-Levi and Kunzel of Liege, have resolved upon proceeding to the trial of guns of the material; and in Vienna some phosphorized bronze guns are about to be tested. Finally, the French Government are abont to make some guns with this bronze, supplied from Liege.

Browning Gun Barrels.—Have your barrel bright and free from grease; you cau get a pretty glossy appearance by the following mode: Applyly the fluid with a sponge, being particular not to touch it with your hands. Let it remain from six to ten hours, or until it gets a brown coat of rust. Then scrape it off with a steel brush, give it anotber coat and scratch as before until the desired color is obtained, which you will readily see when you wet it with tbe fluid. Now take half a pound of carbonate of soda to one gallon of water and boil; scald the barrel with it after it is scratched off the last time, and, while it is warm, apply grease and it is finished with a beautiful glossy appearance. Five or six coats are enought to bring the desired color.—*Scientific American.*

A man in Illinois has patented an iron shingle roof. Tbe shingles are about six by thirteen inches, lap each other so as to insure a waterproof, and are fastened by headless nails. The patent is said to be less expensive than slate.

Scientific Progress.

The Relation of Science to Religion.

The *Scientific American*, in makiug editorial allnsion to the development theory of the Darwin school, remarks as follows upon the relation which scicuce bears to religion:—All scientists have agreed that what can neither be demoustrated as a fact, nor logically inferred from facts, has no place iu scieuce. Reasouiug by aualogy can therefore havo a comparatively limited sphere in science. For although well determiued analogies are facts, the chauces are ten to one that a snpposed analogy will, when critically examined, turn out to be ouly a *pseudo* resemblance.

What we charge agaiust the teachers of this school is that, while their development theory is purely a system of analogical reasoning, they do not declare that this or that couclusion is *probably* correct, but assert it as a fact, and as dogmatically as the most ultra and fauatical religionists, whose higotry they denounce. Thus Huxley, in his address on protoplasm, asserts as positively that in this substance we have the ultimate physical basis of life, and that protoplasm has its origin in the chemieal combination of carbon, hydrogen, oxygen, and nitrogeu in the presence of living protoplasm. The whole tone of his address, though he did not say as much in words, was a sort of trinmphant self congratulation that there was no need of supposing a special creator, since chemical affinity was the general canse of animal existence.

Is then chemical affinity the cause uncaused? Have we yet, or shall we ever arrive at tbe cause uncaused? Does the development theory, the knowledge of protoplsam, help us in recognizing the first of all causes? Would even spotaneous geueration, if proved to take place, as many have sought to prove, reveal a cause behind which we can affirm no other cause can stand? From the very nature of the ease, we can answer these questions in the negative.

So long, then, as mysteries exist, and this will always be the case, man will by faith stretch ont his hands toward the hidden realm, and hope that in that realm there may be something, to satisfy the aspirations of his soul, brighter and better than what he has found through all his gropings. And this faith will form the basis of some kind of religion. The majority of men may perhaps be taught to believe that the human race sprang from apes, but so believing, and seeing the enormous distauce they have progressed from the condition of those animals, they will hardly set limits to progress, and will be little convinced that all opportunity for individual advance is limited to the few toilsome years which form the average term of human life.

Tbe skepticism of the present day is based upon as blind a faith as the belief of the orthodox. But we do not care to quarrel with this faith, or with conclusions derived from pure speculation, any more than we would quarrel with faith in revealed religion. The question of religious belief is one which has no place in scientific discussion. All scientists admit thie, yet there are many who omit no opportunity to give sly and sarcastic thrusts at the belief held by many wise and good men, which, forming the very character of the men who entertain it, is deserving of respect rather than ridicule, not to speak of its intrinsic claims to the acceptance of intelligent minds. Professor Huxley has been particularly obnoxious in this way, and has thereby greatly limited his influence as a public teacher.

It may be replied that aa the religionists attack the scientists, the latter must make some reply in self defence. We do not see the necessity. It is the business of science to discover, record, and classify facts. Whether these facts conflict with or confirm the religious faith of any, does not concern in the least the scientific iuvestigator. If he discovers that the ancestors of mankind were apes, it is his duty to announce his real or supposed discovery; it is not his proviuce to turn upon those who have held a different view and hold them up to scorn or ridicule because tbey believe they sprang from a higher source, and repndiate their anthropoid ape ancestors. If religion be false, it needs no direct attacks to kill it. If the discoveries of science be facts, they will outlive all false notions and superstitions. Science and religion should not be directly antagonized, for, besides that this is needless, neither one nor the other is benefitted by such controversies.

All this we can say, while we own to a decided leaning toward the evolution theory. It seems more consistent with the way in which au All-wise Being would work, that through eternal and immutable laws He should evolve the varied complex structures which people the uuiverse, thau that each should be the result of a special act of creation. In this we see nothing that conflicts with snch an interpretation of the Mosaic accounts as would harmonize with the now very generally conceded allegorical and poetical character of that portion of the Bible.

Prof. Owen, in a recent article, says: "Physiology can affirm no other than that bipeds enjoying(?) 800 years of life could not belong to our species.

Typhoons move in a parabolic rather than a circular course is the result arrived at by a careful investigation of the phenomena connected with the fearful storm of September last.—*Mr. Frank Armstrong.*

Brandy From Wood Shavings.—C. G. Zetterlnno hss heen making some experiments in the distillery at Hulta to make brandy ont of shavings. For this purpose they were boiled in an ordinary kettle under a pressure of 2lbs to the inch. There wss then put into the kettle:

Shavings, (pine snd fir, very wet)	9.0 cwt.
Sulphnric acid, 1.18 sp. gr	0.7 cwt.
Water	30.7 cwt.
Total	40.4 cwt.

After boiling 8¼ hours the mass of shavings contained 3.33 per cent. grape sugar, and after 11 hours cooking 4.38 per cent. A further increase in the quantity of sngar eonld not he obtained. There was obtained in all, from the 40.4 cwt., about 1.77 ewt of grape sugar, or 19.67 per cent. of the weight of the shavings. The acid was neutralized hy lime. The mash had a temperature of 30° C. when the yeast prepared from only 20 pounds of malt was added. At the end of 96 hours the mash was done fermenting, was then distilled and yielded 61 quarts of 50 per cent. brandy at ×15° C., perfectly free from all flavor or smell of turpentine, and of a very pure taste.

It is more than probable that the manufacture of hraudy from shavings on a large acale would succeed if it were ascertained by experiment with how much water the acid mnst be diluted and how long it must he hoiled, for both of these circumstances exert a great influence over the production of sugar.

If it were possible to convert the whole of the cellulose in the shavings into sugar, each hnndred weight of air-dried shavings would yield ahout seven gallons of brandy of 50 per cent. The shavings of the leaf-bearing trees would probably give the hest results.

Surface Electricity.—M. Terqnem has recently made some experiments for further elucidating the fact that the exterior surfaee of a hollow body is alone affected by electricity. Faraday showed that a small animal, placed inside a cylinder of wire gauze, was not incommoded when the cylinder was so highly electrified that sparks were freely given off by it. He also constructed a room, I2 feet in each dimension, of metallic wire, and snspended it by ropes of silk; and he found that, occupying this room, with electroscopes and electrometers at hand, there was not the slightest indication of electrical action inside the chamber, even when sparks of considerable length were given off by the metal of which it was made. M. Terquem verifies these results by taking a metal bird-cage and snspending it to sn iusnlated conductor of an electrical machine. While sparks sufficient to indicate a highly charged electrical condition were obtained from the exterior, pitch balls, feathers, and even a gold leaf electroscope remained unmoved inside. Two bundles of linen yarn were hung, one outside and one in; the inside one was nnaffected, while the outside was excited, the threads diverging from each other and giving out sparks.

Elevation of Polar Lands.—Regarding this change of level, Mr. Howarth remarks: "Not only is the land around the Pole rising, but there is evidence to show that the nearer we get to the Pole the more rapid the rise is. This has heen demonstrated most clearly in the oase of Scandinavia by Sir Charles Lyell, who carefully gauged the rise at different latitudes from Scania, where the land is almost stationary, to the northern part of Norwsy, where the rise is four feet in a century. While in Spitzbergen and the Polar Sea of Siberia, if in the memory of seal-fishers and others the water has shallowed so fast as to have excluded the right whale, we may presume that the rate of emergence continues to increase until it reaches its focus at the Pole, as it certainly diminishes until it disappears toward the south, between the 56th and 58th parallels of latitude."

A New Hygrometer.—Those who have attended chemical lectures will remember that marks made on paper with chloride of cobalt are almost invisible, bnt that on exposing the paper to warmth—as, for instance, holding it in front of a fire—the marks at once become visible. This change is owing to the varying color of this salt under variations of moistnre and temperature. Thie property of the chloride of cobalt to change its color has also been applied to the preparation of such chemical toys as fire-screens, in which portions of the views by which they are illustrated appear or disappear according as they are warmed or cooled. It is now proposed to employ it in the construction of an hygrometer which shall, by its changes in color, indicate changes in the quantity of moisture in the air.

Sulphide of Zonium.—This salt has lately been used in blowpipe analysis as a re-agent, in the following manner: The mineral nnder examination is fused with borax under the reduction flame. A small quantity of sulphide of zodium is then added, and the substance again submitted to the flame. Iron, silver, copper, lead, nickel, cobalt, bismuth, palladium, thallium, and uranium give opaqne masses of a brown or black color. Zinc gives a white mass; the product with cadmium varies from red to yellow as it cools; that of gold and platinum give a bright light brown, and that of tin a translucent yellow brown.

In ærating distilled water for the pnrposes of the table on ships, the nearer the temperatnre of the air and liqnid approach each other, the more readily do they combine.—*G. W. Baird, U. S. N.*

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

STATE OF MAINE.—Jackson *Ledger*, May 4: As work advances the ledge increases in size and richness, hoth in free gold and sulphurets.

PHŒNIX.—The ledge is vsry large and well charged with free gold and rich gold hearing sulphurets throughout.

BRICK.—The Kennedy mine cleaned up on Wednesday $9,000. The rock producing this was taken from the 400 ft. level snd was abont 400 tons, or at an average of $18 per ton.

BUTTE COUNTY.

THE NEW MINES.—Chico *Enterprise*, May 4: Great excitement prevails over the new discoveries on Butte creek. The introduction of water into the district has brought back many old miners, whose prospecting in early years furnished evidence of rich diggings. The section of country ahout Nimshew, in Nimshew township, is rapidly filling up and the whole will soon he under work. Farther down Butte creek, ahout Helltown and Diamondville, extensive and rich grounds are heing discovered and rapidly taken up and rapid preparations making for the introduction of water.

CALAVERAS COUNTY.

PRUSSIAN HILL.—The mill in process of erection on the Prnssian Hill near Railroad and is rapidly approaching completion. The stamps will he in motion in a few days.

Operations are progressing favorably in the Calaveras Co.'s claim at Central Hill. Washing is carried steadily on, an extremely large head of water being used.

ANGELES MINES.—Operations on the mines are heing vigorously pushed forward The "Big mine" and Sickles mine are being steadily worked with good results, and a numher of arastra mills in the vicinity are paying well.

CONTRA COSTA COUNTY.

COAL MINES.—Pacheco *Gazette*, May 4: Work has never been prosecuted with more ensrgy than during the past 8 or 9 months; and the coal shipments from the Black Diamond alone, hesides those from the Pittshurgh, Union, Eureka, and Central, have heen ahout 10,000 tons per month. The pay roll of that Co. at the mines, for April was $26,000.

EL DORADO COUNTY.

RICH STRIKES.—Placerville *Democrat*, May 4: We hear of a numher of rich strikes having been made in the north part of the county, the richest of which are in the vicinity of Greenwood. In the Cederhnrg claims they have fonnd some of the richest ore ever unearthed. It is literally gold bearing qnartz instead of quartz hearing gold.

POOAHONTAS Co. at Logtown, cleaned up after a 10 days run, on the 28th, $17,600.

BONDED.— Placerville *Republican*, May 2: The Maryland, in this city, has been bonded to a S. F. Co. and a shaft is to he sunk immediately.

INYO COUNTY.

BULLION.—Inyo *Independent*, April 27: On the first day of April there were shippsd from the mill of Hiskey & Walker, Desp Spring Valley, (extracted from Lida Valley ore) 6 hars weighing 2,442 ozs., valued at $2,800. Also, from the same, April 11, 8 bars weighing 3,200 ozs., valued at $3,700.

PROGRESSING.—The work of repairing damages at the Eclipse works is progressing favorably, some 3½ miles of the canal having heen fixed up as before, while repairs to the furnace are being pushed ahead. It is expscted the whole will he in runniug order in less than 10 days.

LIDA VALLEY.—The "Mountain View" owned by Halsey & Co., had one ton of rock worked, which yielded $1,016.35 in silver, and $13.25 in gold. The Manhattan Co., of Austin, are intending to put a mill in Lida Valley, which the miners think will do a spledid business.

THE BORAX WORKS.—M. A. Hearne, of the borax works near Columbus, is making $10 to $15 a day with the emall worke in uee. He intends to enlarge his works to many times their present capacity.

LOS ANCELES COUNTY.

SANTA MONIOA.—Los Angeles *News*, April 23: It is not generally known that a rich gold quartz ledge exiets on the beach in the vicinity of Santa Monica, a favorite watering place 18 miles from this city. The ledge runs parallel with the ehore, and is only exposed for about 10 minntes at low water. For several years past, some native Californians have visited it daily, breaking off with pieces of rock they could during the brief moments of its exposure. The rock thus obtained is represented as heing exceedingly rich, having gold well distrihuted throughout.

NEVADA COUNTY.

NUOGET RAVINE.—Grass Valley *Union*, May 1: We saw yesterday, at Findley's bank, ahout $500 worth of nuggets lately out of nugget Ravne. The gold is in lumps and is washed smooth. In worth it runs over $18 an oz.

ENTERPRISE GRAVEL.—This Co. will soon have efficient steam machinery on its claims.

NORTH STAR.—Affairs are progressing very favorably. A new stsam pump was put in last Friday night and up to yesterday morning the water had been lowered ahout 58 ft.

INDEPENDENT MINE.—We saw a few days ago a fine nugget, worth ahout $25, of washed gold, which came from the Cos. claims.

Nevada *Gazette*, May 4: GENTRY'S MINE.—This mine, ahout one mile from town, is doing well. They stsrted piping last Saturday evening. 600 inches of water are used.

PLACER COUNTY.

Auhurn *Herald*, May 4: PROMISING MINE.—The Alabama Co. have let a contract to sink their shaft to 105 ft. At 40 ft. the ledge is 3 ft. 8 inches thick, at which point the last crushing of rock paid $43 per ton. This mine is ahout one mile helow Newcastle, and some 200 yards west of the Julian mine.

PLUMAS COUNTY.

Quincy *National*, April 27: INDIAN VALLEY MINE.—Over 40 men are at work. They are only running 12 stamps at present, and the rock they are crushing is low grade.

ARGENTINE.—Heath & Freeman havs commenced piping. The Talc Co. are remodeling their mill—removing engine and hoiler, and preparing to use water as a motive power. They will add another battery and use a "Leffel" wheel. They expect to start up ahout the middle of May.

BLACK HAWK.—Turner, Rice, Austin & Co., are stripping a large amount of hedrock this year, and will he ahle to keep their pipe running for some time. The Co. has already made one clean-up, this spring, of $1,200, and the indications are that the claims will pay splendidly for the season's run. Several other Cos. are at work on the creek.

MOUNTAIN HOUSE.—The water is running through the Plumas Water Co's. ditch, and the Co. will commence work in their claims at this place immediately, running 5 pipes.

PENNSYLVANIA.—Bidwell & McIntyre, of the Pennsylvania mine, near Greenville. have a force of men at work, and thsir 12 stamps are husily running on good rock, Their new tunnel is in 1,000 ft.

CHEROKEE.—Compton is still running his 6 stamp mill, on Baker rock, and is getting splendid pay. Gregg is preparing for work in the Yellow Float. Mr. Dupsy, of S. F. is sinking a shaft on the Eureka.

SAN DIECO COUNTY.

BULLION.—San Diego *Union*, April 25th: There was shipped to S. F. yesterday bullion amounting to $1,800, from the Julian mines.

THE MINES.—The miners are in the most huoyant spirits over the turn affairs have taken in connection with the Owens lead. The rock will prohably surpass $75 per ton in value. The Stonewall lead is also improviug in the character of its ore as the shafts go down. The Golden Chariot lead is heing worked vigoronsly. At present they are drifting, and the miners who have examined the lead unite in saying that there is $35,000 or $40,000 worth of rock in sight.

$10,000 CLEAN-UP.—San Diego *Bulletin*, April 27th: Mr. Defrees, who came from the Julian mines yesterday, and laid on our table 9 bars of gold, the product of eleven days run on Owen's rock. The nine bars weigh nearly $10,000, the product of 150 tons of rock; hut 50 tone of this rock was made up of slate and refuse, as they worked everything hetween the casings. This rock is taken out at a depth of 200 ft. Levels are run 130 feet each way at that depth; so the owners of the mine know they have *thousands* of tons of this rock ahove them, and the rock below is richer than any taken out above. The Owens Co. have 10 men to work in the mine and in the mill, so the average of this run is $56 daily to the man.

SIERRA COUNTY.

BALD MOUNTAIN.—Downieville *Messenger*, April 27th: H. Wallis has heen chosen Foreman of the Bald Mountain, of Forest City. The workmen have already commenced to run tunnels for the purpose of opening a hreast.

THE High Commission Co. are taking ont very rich rock.

STRUCK IT.—Plumas *National*, April 27th: Prospecting tunnel in the neighhorhood of Queen City has been driven into good paying gravel, and the indications are that the "strike" will develop an extsnsive gravel dsposit, and a very valuable olaim.

SISKIYOU COUNTY.

GOOD PAY.—Yreka *Union*, April 25th: Reynolds & Coleman are engaged in washing up on their claim on Rattlesnake, and they are receiving about $8 per day to the hand.

CRUSHING.—Cornish & Clark have just made a crushing of 50 tons of rock from their ledge at the Eliza mill. It yielded $20 to the ton.

TUOLUMNE COUNTY.

APP MINE.—Sonora *Independent*, May 4th: The capacity of the mill is twenty-five stamps, but at present, to test the ore, only fifteen stamps are in operation. They expect soon to start the whole.

RICH QUARTZ.—The Burgess, Woodman & Jones quartz lode, north of Columhia is yielding some extremely rich rock. On Thursday, Mr. Burgess exhihited two pieces of rock from the lode, weighing 64 ounces and containing $700 in gold. All the claims on the Flat, or rather on Wood's Creek, are at work and doing well.

GOLDEN GATE QUARTZ MINE.—This lode is on the south side of Sonora, above Bell's Mill's and is owned by Hon. W. G. Long, of this city. He is down on the lods ahout 20 ft. where it is 3 ft. wide.

OLD TUOLUMNE QUARTZ MINE.—This mine is in Wet Gulch, ahout 3 and 1-4 miles from Columhia, and noar Pine Log Crossing. Two shafts are being sunk, one 18 and the other 20 ft.

MINING IN TOWN.—Pugsley, Page & Co., who own a claim in the hill immediately hehind the residence of Luke Wheslock, are preparing to hydraulic it down, with good prospects of success. Ahout 50 ft from where they have started in, a Co. who formerly owned the ground, got extremely rich dirt, but were not so deep as the present Co. hy 15 or 20 ft.

Nevada.

EUREKA DISTRICT.

RICH STRIKE.—Eurcka *Sentinel*, May 2: J. H. Lyon and M. Dwyer have developed a ledge of exceedingly high grade ore in the Mayflower mine, Morgan district. We were yesterday shown an assay which gave $1,101 per ton in silver.

LEMON HILL. The new furnace will be completed hy the last of the wsek.

RICHMOND.—The Tip Top incline is being deepened so as to admit of a new level being opensd in that part of the mine.

ADAMS HILL Co.—Operations on the mines of this Co. are heing vigorously pushed. Lately a fine hody of rich ore was developed in the Wide West shaft at a depth of 100 ft. The Gen. Lee is showing large quantities of high grade ore in the tuunel, shaft, and Ellsworth shaft. A crushing of 1,000 tons of ore is to he made at an early date.

ELY DISTRICT.

PAGE & PANAOA.—Ely *Record*, April 28: The shaft is down 210 ft. with good working rock in bottom. The east drift, at 160 ft. level, shows good ledge matter shout 5 ft. in width, with pay streak of from 2 to 2¼ ft. When the shaft has attained a depth of 300 ft. a new station will he opsned and a drift will he run.

CHIEF OF THE HILL.—A tunnel has been run into the hill 50 ft., at the end of which the ledge was first enconntered. From the end of this tunnel a shaft has been sunk 40 ft.; and 150 ft. in an east, and west direction, following ths ledge. At the west end a winze has heen sunk 52 ft., following the ledge all the way. From the hottom of this winze a new level is heing opened, which showe the ledge and good ore throughout. A fine hody of ore was struck in the hottom of the east drift on the lower level, while in the west drift the ore shows much better on the roof of the drift. At present there are about 120 tons of good milling ore on the dump, assays from which have averaged from $150 to $250 per ton.

WASHINGTON & CREOLE.—The shaft is dowu 420 ft. In running a drift on the 334-ft. level west, they passed through a body of ore 20 ft. in length; and in running east on the same level another body of ore was found. Both will mill ahout $125 per ton.

PIOOHE WEST EX.—Suspended work on account of inability to procure lumber, hut expect to start np again in the early part of the present week.

RAYMOND & ELY.—The 323-ft level has been connected with the shaft and track laid in it for over 300 ft. in length. The entire body, over 450 ft. in length by 120 ft high under the 223-ft. level, is as yet untouched, there heing over a months supply left ahove it. The winzes, started from the town level, all show the same ore as above. The receipts of the mills for April will be ahout $320,000.

PIOCHE.—This mine is extracting over 10 tons of $200 ore psr day. During the last 12 days previous to the 24th inst., $25,000 was shipped as the run from the mill during that time. The stopes on the 4th level have improved very much within the 10 days, all the drifts are heing pushed ahead, and prospecting is going vigorusly on.

CONDOR.—The shaft is down 90 ft. and the ledge shows well. A large amount of milling ore is on the dump.

LOUISE.—Shaft is down 50 ft., showing 3 ft. of ledge. About 1 ft. of the ledge is good paying ore, asssying from $110 to $125.

MEADOW VALLEY.—Sinking of the shafts on Nos. 7 and 3 and at the Summit is heing pushed stesdily forward.

WARD BEECHER.—Shaft down 240 ft., and sinking on strike mentioned in our last. Have 3 small streaks of ore in bottom which show signs of widening.

CHAPMAN.—They are raising some ore and getting the mine into working shape.

MAGOIE.—The ledge shows well in the shaft and is over 2 ft. in width.

ALPS.—Work on main working shaft going rapidly ahead, and a dspth of 65 ft. has been attained.

BOWERY.—Prospecting and drifting for lsdge. Shaft down 200 ft. About 50 tons of ore on the dump.

ORLEANS.—Work will he resumed tomorrow. The shaft is down 75 ft.

ALPINE WEST EX. AND MEDASSA.—Shaft down 60 ft., and in sinking has cut through 2 ledges. Work being pushsd with good prospects.

ALPINE.—Good progress is heing made in sinking and running the drift and prospects continue very enconraging.

EXCELSIOR.—Work heing pushed ahead in lower winze and drift to make connections for air.

LAFAYETTE.—A shaft has heen sunk 190 ft., which shows ledge mattsr from the surface to the hottom. The ledge is from 4 to 6 ft. wide, and at several points in tho shaft there are fine deposits of ore.

ALPINE shaft is down 93 ft. The walls are perfect, and the ledge is over 5 ft. wide, carrying good ore. Assays ranging from $50 to $200 per ton have been obtained. A large body of ore has heen struck at 90 ft., and a drift will he run along the ledge snd across it, to determine the extent of the deposit.

PEAVINE.—This claim is improving in the lower lsvels, and the ledge is growing larger and richer as depth is obtained. The dump contains 75 tons of ore that will mill $150 to the ton. Three shifts working.

HUMBOLDT.

BULLION.—Unionville *Silver State*, May 4: Amount shipped from the Arizona, since our last issue, was $5,725.

MADRA.—This ledge, in the foothills near Humholdt City, is owned by the Starlight Co., who will soon put a force of men at work to develop it.

STARLIGHT.—This mine at Humholdt City, is the only one being worked at that place. The Co. is sinking an incline shaft on the ledge, which is down ahont 70 ft. The ledge is from 3 to 4 ft. wide, woll defined with good walls on hoth sides, and carries large quantities of iron sulphurets. The ore is composed of argentiferous galena, and occasionally chloride, black sulphurets and some gold.

REESE RIVER.

REVIEW.—Reese River *Reveille*, April 27: Pacific Co. In the Land and Fuller shaft in the cross cut at the 550 ft. level, the size of the ore body has increased. From the 400 ft. level taking out high grade ore. In the Buel North Star are stoping on the ledge in good ore; 40 tons of high grade ore will he shipped on Monday. Working 54 men,

GROVE TUNNEL.—This mine is divided up iu contracts, among whom Moor & Co., Delano & Co. and Lamb & Co. are getting good ore, and Renolds & Co. and Canterhury & Co. are doing prospecting work, being in a hreak of the ledge. Working 22 men.

MORGAN AND MUNCEY.—Hoisting high grade ore from the 400 ft. level and piling in ore house. Pay streak in the eastern part of same level has increased from 4 to 9 inches of high grade ore in a 2 ft. ledge.

SAYBROOK.—Getting ore of average grade at the 110 ft. level.

ESTHER.—The formation in the cross cut at tho 200 ft. level gives evidence of the near vicinity of ore. Working 5 men.

DIANA.—Getting ore at the 120 and 150 ft. levels. Working 15 men.

ISABELLA is getting good ore, and doing extensive prospecting work. Working 20 men.

PENOBSCOT (Central Hill).—Working 6 men and getting good ore.

SEMANTHA.—The ledge has widened considerably and the grade of the ore is much enhanced. Working 8 men.

MANHATTAN SHAFT.—Thoro are over 100 tons of good ore on the dump. Hoisting oro from the lowor levels. Working 35 men.

FLORIDA.—Getting out oro of high grade. Shipping to the Manhattan. Working 12 men.

STAR OF NEVADA.—Thero is a tunnel in 500 ft., in the oast level, whore thero is a ledge from 12 to 14 inches thick. Working 12 men.

EMIGRANT CANON—SOUTH SONOMA.—East level sinking incline, down 20 ft. in good sulphurot ore; 3 men at work.

MILLS—MANHATTAN.—Running steadily on custom ore and ore from the Co.'s mines.

WREN'S concentrator is running steadily.

VIRGINIA.—Four tons of ore worked at tho Manhattan, gave $887 per ton.

EL DORADO SOUTH CON. CO.—El Dorado mino working 26 men, running new levels north and south in good ore. Main Incline going down with dispatch, taking out a 6 ft. vein of fair ore.

ARIZONA.—Working 10 men running levels.

BELMONT CO.—Commenced work on Wednesday, repairing the old works, and preparing for vigorous prosecution of work The Transylvania miue of this Co. shows an immense body of rich chloride and Stedefeldtite ore. The yield by mill working of their ore is over $400 per ton; working 12 men. This Co. have commmenced tearing out the old machinery from their mill preparatory to putting in new machinery for a complete 20 stamp mill.

MONITOR.—Is yielding large quantities of $500 ore of which thcre are piled on the dump over 150 tons; working about 20 men.

JEFFERSON CANON.—The ledges are narrow but rich varying from 18 inches to 3 ft. in width; about 25 tons of ore on the different dumps will work from $500 to $800 per ton.

WASHOE.

LOCAL SUMMARY.—Gold Hill *News*, Msy 4: HALE & NORCROSS.—Daily yield 200 tons, from the north portion of the 1400 ft. level, with about 70 tons from the upper levels. At the 1500 ft. level, jnst being opened, the main drift east from the incline cut through the west wall 51 ft. from the incline, and has penetrated the ore vein 15 ft. Hoisting of ore from this point commenced yesterday. At this level a drife north in the west wall is in 45 ft. from the incline. The incline is not being sunk deeper at present. The vein at this lower level stands straighter, or more perpendicular than in three levels above—a very significant circumstance—and, althongh penetrated by drifts, both of the lower levels together do not flow more than a gallon of water a day.

SILVER HILL.—This mine in Lower Gold Hill is a combination of the old Waller's Defeat, Lucerne, St. Louis and Echo grounds. The ore comes from a series of veins and is essentially gold ore, with little or no silver. A new shaft 225 ft. deep is being sunk. New and excellent hoisting works are being erected.

UTAH.—The new shaft commenced 600 ft. east of the old works in the center of the mine, is being sunk at a satisfactory rate. The vein in the old workings is from 30 to 60 ft. wide, and assays about $17 to the ton. The new shaft is expected to strike the ledge on its eastern dip at 500 ft. when it will be drifted into and well prospected.

CONS. VIRGINIA.—Some favorable looking quartz, showing considerable metal is found in prospecting the 500 ft. level, especially in the cross-cuts from the north drift, also in the raise above the north drift, at which point connection is made with a drift from the Ophir, giving good circulation of air. Drifting is steadily prosecuted at the 1160 ft. level, from the Gould & Curry, with no ore as yet.

MCMEANS.—The tunnel is 600 ft. long, penetrating 65 ft. vein, and the shaft is 100 ft. deep, intersecting a black ledge over 30 ft. wide and containing spots of very rich ore.

OCCIDENTAL.—Work was resumed last week in the lower tunnel, which is being driven further north, toward the boundary line.

NEW YORK CONS.—This mine is in Lower Gold Hill. The north Ophir hoisting works have been purohased, removed thither, re-erected and put to work. The shaft is freed of water, and drifting on the ledge commenced with most excellent prospects.

CROWN POINT.—Daily yield 430 tons. This ore breasts are all looking and yielding splondidly, and an immense amount of bullion is being produced. The principal oro supply is from tho 1100 and 1200 ft. levels.

YELLOW JACKET.—Daily yield 50 tons The incline has nearly roached the 1,500 ft. level, at which point a new station is to be opened. At the 1,300 ft. level, near tho Kentuck line, some very good ore has been developed dnring the last 3 or 4 days.

PICTOU.—Situated on the Comstock, in Lower Gold Hill. Shaft 155 ft. deep, with an incline 70 ft. deeper in the ledge. Tunnel is in 550 ft. with 100 ft. further to go to cut the ledge.

GOULD & CURRY.—Drifting both north and south at the 1,500 ft. level and preparing to drift east of the same level. The incline, which starts from the shaft 80 ft. above the level, is being timbered.

ARIZONA & UTAH.—A raise has been made to the hight of 85 ft. above the tunnel, and a cross-cut from it is in 15 ft. toward the ore vein which it will intersect next week.

OVERMAN.—The 700 ft. station of the new shaft is opened, and drifting west toward the ledge commenced.

KENTUCK.—Regular yield about 35 or 40 tons a day—keeping the Devil's Gate mill running. The drift through the 1,300 ft. level being run by the Crown Point and Yellow Jaoket, Co.'s for air connection will bo completed in about a week.

IMPERIAL-EMPIRE. — Drifting into the ledge has commenced at the 1,500 and the 1,650 ft. levels from the incline. At the lower level 2 drifts branch out from the station, one for the Imperial mine and the other for the Empire.

CHOLLAR-POTOSI.—Daily yield 150 tons from the Belvidere, Blue Wing and other old ore sections. Prospecting in various parts of the mine is vigorously carried on.

SUTRO TUNNEL.—In 2,767 ft. with the face still in very hard blasting rock.

SIERRA NEVADA.—Daily yield 50 tons.

SAVAGE.—Daily yield about 60 tons, assaying on the average $38. The new ore deposit at the lowest levels is reported to be improving in quality.

GLOBE.—The work of development is being actively pressed.

DANEY.—The main shaft is down 565 ft. and it will soon intersect the ledge. The drifts at the 500 foot level look favorably.

OPHIR.—Good ore is reported found in a cross-cut from the south drift at the 1,300 ft. level.

CALEDONIA. — Still retimbering the shaft. The new works started up on Wednesday.

SUCCOR.—Only enough ore is taken out to keep the Co.'s mill running. The new shaft is sunk rapidly.

BOWERS.—Work in this old mine in Gold Hill proper will shortly be resumed.

LADY BRYAN.—Work is about being resumed, under the most favorable auspices.

STARTED UP.—Virginia *Enterprise*, April 30: The Petaluma mill, Lower Gold Hill, and the Ophir mill, on the Carson river above Dayton, both started up on Saturday.

WE yesterday noticed at the Bank of Csl. 18 bars of Crown Point bullion worth $55,155.

MERRIMAC MILL.—The mill, Carson river, is running to its full capacity—about 50 tons per pay.

ACTIVITY.—Work is being resumed in every direction on old mines which have lain idle ever since the White Pine excitement.

BULLION.—Reno *Crescent*, May 4: The shipment for 2 weeks ending last night amounted to 36,986 lbs.

WHITE PINE.

REVIEW.—White Pine *News*, April 27: BULLION.—W. F. & Co. shipped to-day from this city to S. F., for the Bowery Co., Pioche, 2 bars, valued at $2,520.51

TREASURE HILL MINES.—SECOND SOUTH EX. OF HIDDEN TREASURE.—The owners having purchased the Anchor Co's. tunnel, the principal work has been carried on through that opening on the lode. From an incline which follows down the east wall 40 ft., a drift has been run northerly upon the stratified spar wall 80 ft., disclosing a fine breast of ore. At the north end of the mine, the old shaft of the locators was continued on down to 60 ft., and drifts run off east and west, exposing bodies of qnsrtz rock. Abont 120 tons of good quality of milling rock is piled up for shipment.

NORTH AURORA.—Breasting out on the line of the South Aurora, in the Risdale chamber, and running out ore through the South Aurora lower tunnel to the tramway station. The winze in the Ward Beecher will be connected next week. The total shipment by tramway from the Co's. mines is about 80 tons per day.

EBERHARDT.—Snow accumnlated in the tunnel from the Keystone shaft to a depth of 25 ft. Tho force of men employed breasting out is at work clearing out the snow and placing the tracking of the tramway in working order. The ore piled back in the shaft will then be run out and shipped to mill.

NOONDAY.—Working a force of 4 men, breasting out. The ledge is 5 to 6 ft. wide, showing the usnal grade of ore. Hoisting and piling on dump. There is about 300 tons of ore on top.

MAMMOTH.—The ledge averages 7½ ft. wide, showing ore that averages $50 per ton assay.

Arizona.

MINES AND MINING—Prescott *Miner*, April 20: Yavapai Co. The Vulture, Tiger, Del Pasco, Benjamin and other Co.s are hard at work.

The miners of Castle Dome are extracting ore and shipping it to S. F.

Colorado.

BOULDER CO.—Central *Register*, April 24: In the Grand View a rich body of mineral has been struck.

Jo. Irwin, W. Stephens and others, have purchased a half interest in the Gray Eagle lode. It shows a large vein and some rich mineral.

THE Church Bros. have the water pumped ont on the Gunnell Central mine, on the Gunnell lode.

THE whole length of the Bobtail tunnel is 625 ft. Fifteen ft. is the weekly rate of advancement. The Fiske lode is cut about 588 ft. from the mouth. A drift has been run east on this lode about 30 ft., 12 ft. high.

THE new stamp mill of Wheeler & Sullivan's on North Clear creek, is approaching completion and will be in operation early next month. There are five 5-stamp batteries.

THE B. and C. Co.'s works treat daily 25 tons of ore.

Hulverson & Dierdoff will start up their 6-stamp mill on James Creek, in about 2 weeks. Eric Bottolfson will start up his 10-stamp mill as soon as the road is open.

Idaho.

LOCAL RECORD—EMPIRE.—Silver City *Avalanche*, April 20: The new shaft has been partially timbered to the adit level, which is 90 ft. from the surface, and sunk 10 ft. below the level. The new shaft is being sunk 280 ft. from the south line, and as soon as drifts can be run from this shaft under the old stopes, there will be an abundance of first-class ore that can be easily taken out. The stopes being worked from the cross-course toward the new shaft look splendid.

NORTH ORO FINO.—The drift has been run north from Oro Fino lines 118 ft. Fifty-five ft. behind the present end, a rise has been started to communicate with an old shaft which was sunk in former workings 80 ft. below the adit level. From the 2 level drift to the bottom of the old shaft is 75 ft.

ORO FINO.—The ledge looks well, averaging for whole depth of winze 20 inches in width. The old stopes are being pretty well worked out, but they will commence stopes from the winze as fast as there is room.

ELLMORE.—The shaft has been sunk 18 ft. below the 7th level, and should the ground continue as good for sinking it will not be long ere drifts will be running under the rich ore now found in sinking the winze. The ledge holds its own, is 2 ft. wide and good milling rock. The 7th level is progressing rather slowly the ground is hard and the ledge very solid, but the ore is first-class.

GOLDEN CHARIOT.—The winze in the bottom of the 8th level is down 48 ft. They are at work cutting down the shaft at the 5th, 6th, and 7th levels, both up and down.

MINNESOTA.—The stopes in back of 2d level continue good and there is being daily shipped to the mill 15 tons of good ore.

SOUTH CHARIOT.—The shaft has been sunk 6 ft. below the 4th level, and straightened at the same time 60 ft. below the 2d level. The 4th level drift is being run north, showing the ledge to be about one inch wide, but not very rich.

MAHOGANY.—The 5th level south has been run 24 ft. where the ledge ranges from 15 to 20 inches in width. The north drift is in 18 ft.—ledge 16 inches wide. The rock from both these drifts is first quality, and will mill fully $100 per ton. This mine is shipping daily to mill 20 tons of good milling ore.

OMEGA.—Work has been resumed and ore being taken out north of the shaft for reduction.

THE ore which is piled up on Treasure Hill, in White Pine, awaiting transportation to the mills, is estimated to be worth $1,250,000. The condition of the road prevents shipment.

S. F. Stock and Exchange Board.

THURSDAY, MAY 9.

An account of the fall in mining stocks this week will be found in another column. The sales at the Board for the week ending Wednesday the 1st inst. were $2,600,000 less than for the previous one, amounting to $8,580,000. The receipts for April from the Raymond & Ely mining company were $317,434, equal to $10,581 per day. The April receipts from the Meadow Valley mine aggregate $110,000. On May 3d $30,000 was shipped from the Chollar Potosi, and last week the mine produced 1,100 tons of ore. The largest dividend ever paid in a single month by any mining company was paid by the Crown Point; it was $40 per share, or $800 per foot aggregating $480,000. The Hale & Norcross mine yielded last week 1,000 tons of ore and the Savage 600 tons. The dividend of 50 cents by the Yulc Gravel company amounts to $5,000. A shipment of bullion from the Mahogany arrived to-day. The Enreka Cons. Co. produced last month 1,855 bars of bullion weighing 213,400 pounds. The amount of ore on hand is 1,725 tons. Over 3,000 tons of ore was raised from the Crown Point mine last week estimated at $133,000. Stocks this morning show a partial recovery from yesterday's depression.

A number of companies have announced meetings for the purpose of increasing their capital stock. The Empire M. & M. Co. will meet in June 10th to consider a proposition to increase their stock from $1,000,000 in 12,000 shares to $5,000,000 in 50,000 shares. The St. Louis M. Co. will meet June 6th to raise their capital to $1,000,000 in 10,000 shares. The Del Rey meet June 10th and propose increasing the stock from $100,000 in 1,000 shares to 3,000,000 in 30,000 shares. The Kentuck Co. meet on the same date and propose increasing the stock from $400,000 in 2,000 shares to $4,000,000 in 20,000 shares. The Alamo G. & S. M. Co. meet June 4th and propose increasing their stock from $300,000 in 3,000 shares to $3,000,000 in 30,000 shares. The Green G. & S. M. Co. will meet June 3d to decide a proposition to increase the stock from 600,000 in 2,400 shares to $2,400,000 in 24,000 shares. The Overman Co. propose on the 5th of June to increase their capital from $1,280,000 in 12,800 shares to $2,400,000 in 64,000 shares. The Confidence M. Co. propose increasing their stock from $780,000 in 1,500 shares to $2,496,000 in 24,960 shares. The Adriatic Co. meet June 8th to take into consideration a proposition to increase their stock to $2,700,000 in 27,000 shares. The Gold Cañon Cons. Co. propose increasing their stock from $700,000 in 35,000 shares to $3,500,000 in 35,000 shares.

UTAH NEWS.—The warm weather in Utah is causing the snow to disappear rapidly from the cañons, and the miners are resuming work in all quarters. Prospecting parties are starting out, and mining matters all look favorable. Nine smelting furnaces, costing in the aggregate $300,000, are now in operation near Salt Lake City. It is understood that the work of building the first section of the Salt Lake & Pioche Railroad is to be commenced immediately. Grading on the Utah Southern Railroad progresses rapidly.

The Wild Pigeon of California.

(*Estopistes Migratoria.*)

The wild pigeon of the Pacific coast differs from its prototype, the pssseuger pigeon of the Atlsntic States, only in heing a larger hird, with a darker plnmage. It is equally migratory in its habits, but never seen collectively in snch large numbers as charscterize the assemhlsges and migrations of the passenger pigeon in other parts of the world. A few hundreds at most, being as many as sre ever seen together for any length of time in one plsce.

They are found in the foothills and lower monntains of the Sierra Nevsda and Cosst Range, principally in Autumn, at the sesson of the ripening of the madrone berries. Their food consisting of herries, the seeds of weeds and grasses, and grains. The Cslifornia pigeon is remsrkable for its symmetry of form, the exreme rapidity snd elegsnce of its flight. It propels itself hy quickly repeated flappings of the wings, hringing these at times closely to the body with firm strokes, and, before alighting, breaks the force of its flight hy several rapid beats, as though fearing injury from coming too snddenly into contact with the ohjectupon which it may desire to rest.

The male of this species has the throat, hresst and sides brownish red; sometimes with a purplish tint, under parts of the body pale slate color or bluish white. Head hlue; hind part and sides of neck changing to gold, green and hright crimson. Upper part of body blue; wing coverts marked with black spots; quills dark slate, almost black; tail feathers dark brown and blue. The female has a similar distribntion of colors, hut very mnch duller than the male.

The eastern pigeon, thongh not possessing the strength, size or weight of the California bird, is nevertheless capable of moving throngh the air at a mile a minute; and it has been killed in New York with its crop yet filled with rice collected from the fields of Georgia or South Carolina, which it must have left only five or six hours hefore. We say *only*, because as they digest their food rapidly, they must necessarily have travelled the distance within the time allowed, in order to have arrived with the rice still in its perfect, unsoftened state.

The shape of their body is oval, with a sharp pointed tail, admirably constructed for rapid evolutions, and also furnished with a pair of long wings, moved with large and powerful muscles. The rapidity with which this bird will pass through a wood is perfectly astonishing, threading its way among the closely-grown branches with nnerring course, it flashes upon the sight like a meteor, and is gone from our gaze.

The flesh of the California pigeon is dark, bnt its juices are rich, and by many is much liked. The young, or squobs, as they are termed, are very tender and delicate, and much more esteemed as food than the adult birds. They generally select the tallest trees they can find to breed in, and as many as a hundred nests are often seen on a single tree. The conduct of the male at this time is much like that of the domestic pigeon, elevating and depressing the body, swelling out the throat, and expanding the tail, he moves arouud the timerons female, uttering the soft coo-coo-coo, so familiar to everyhody who has ever been near a dovecote. They lay only two eggs, elliptical in form snd pure white. The pigeon never nests at auy great distance from water, to which it resorts several times during the day, and when it drinks immerses its bill up to the eyes, and remains until its thirst is satisfied.

THE WILD PIGEON OF CALIFORNIA.—ESTOPISTES MIGRATORIA.

We Commend the Pleasures of the Glass.

The cost of a pocket msgnifying glass is but trifling, yet its possession is almost invaluable ss a source of plessure and instruction. If, while walking in the garden or the field, we apply its power to the leaf, the fruit, the flower, or the form of the minutest insect life, it brings out the wonders of creative skill, of adaptation of means to ends, marvelous ingenuity and complications of wisdom, of which we had previously no knowledge or conception.

Nor is it necessary that we confine its use to living vegetable or animal forms, but take the hroken crystal, the grain of sand, the snowflake or the frost upon the window-pane, and these see through the glass as an aid to ohservation, will teach us lessons teeming with wonder and delight. To our young readers particularly we commend the pleasures of the glass; carry it in your pocket, apply it to whatever of interest or curiosity you meet with, animate or inanimate; the budding leaf, the opening petal, insects emerging from their wondrously formed habitation, the wing of the hee or the hutterfly, in fact everything upon which you can bring your glass to hear and which you can take time to examine, and it will increase your knowledge, multiply your sources of intelligent recreation and imhue your mind with larger and more exalted conceptions of the power and wisdom of the Almighty.

The idea of reclaiming the Colorado desert hy means of artesian wells is being mooted in San Diego. It is helieved by those acquainted with the topography of the country that a large subterranean stream runs under the desert, and that all that is necessary is to bore deep enough to strike it. Congress will be applied to for a land grant as a recompense for boring these wells.

Wild Flowers.

Although nearly the whole list of California wild flowers are entirely odorless and single petaled, in distinction from double flowers, the result of cultivation, yet there are very many of rare heauty; exquisite from their very singleness and simplicity of form aud hight of coloring; they would, if growing hy the side of their more gaudy, double-sisterhood of cultivated flowers, cause a blush—if flowers can hlush—upon their flouncing petals.

May pic-nic-ers from the cities to the country cau attest the beauty of the wild flowers, as worthy the attention, love and fun of picking them; and very many, yesr by year return to city homes from these excursions, fully determined that another year they will have these wild beauties growing in their own gardens. And nothing would he easier if it were possihle to ohtain the seed. But in this lies the difficulty. The seeds are not ripened till mid-summer or autumn, and then all is dried and withered; and with the lost heauty of the flower goes all thought of its possesion as a garden adornment. And thus we go on from year to year, renewing our admiration of them with every returning spring-time, only to be again forgotten. And yet with all our ueglect and forgetfulness, the beautiful wild flowers come again, conducing to our happiness and pleasure because the Giver of flowers will have it so. We ought to love flowers, if only in gratitude to the great Giver who, though wholly unsolicited, annually renews the charming gift.

An interesting trial recently took place in England, wherethe water from a canal found its way into a coal mine, and the owners bronght suit against the canal company for damages. The judge held that although the owner of the mine had been compensated for the use of the surface ground by the company, any damage to the mine must be paid for by the company, the canal company had the right to carry the water over the mine, but were responsible for any injnry that might occur.

A powerful disinfectant, especially adapted to the destruction of insects, is prepared by passing sulphurous acid into alcohol.

Artesian Wells in Nevada.

Hon. C. W. Kendall, member of Congress for Nevada, has introduced into the House of Representstives, a bill to encourage the sinking of artesian wells upon the public lands in the State of Nevada, and supported it with a very interesting speech showing the general utility of such wells and their special applicstiou to the Great American Basin, near the center of which the State of Nevada is located. We think there can be no question as to the feasibility of a general system of irrigstion being established for that region by the sinking of such wells. The country is almost destitute of rivers, at least to such an extent as to render any extensive cultivation impossible hy any other mesns than the one suggested.

The "encouragement" asked for is simply a fee to a certain extent of land adjoining any wells which msy he sunk to a depth which will yield a sufficient qnantity of water for their irrigation. The amount of lsnd to be donated is left hlank in the hill, to be filled up as it msy be deemed advisable from suggestions and facts which may be brought out in the course of debate and consideration of the hill, previous to its final pssage in the House. We certainly can see no reasonable objection to the passge of such a bill, provided no more land is taken than any given well can properly irrigate. The land is generally worthless without such wells, and as the government does not propose to go into the hnsiness of well digging, it had better give a little to any one who will give a value to the land, and thus add to the taxable property of the country.

With regard to the amount of land which shonld be granted to each well, the Humholdt *Register* says:—"This is not an easy question to answer satisfactorily. If the estimated cost of each well is five thousand dollars then it would reqnire a grant of six sections of land to cover the cost; estimating the land at Government price. Then again, it is believed that a well flowing twenty inches of water, miner's measurement, would not he sufficient to irrigate more than 100 acres, while some ranchmen say that 20 inches of water will not more thau sufficiently irrigate 80 acres. As 160 acres in all probahility, will he all that can be irrigated by one well, we would suggest that amount as the size of the grant. It will make no material difference, whether the grant is for 160 or 640 acres, as a well would have to be sunk on each quarter section to make the land of any value. The land, without irrigating is of no value whatever, and it will he a wise act on the part of the Government to give all such land to settlers who will nndertake to reclaim it."

Conflagrations have frequently originated in England from the ignition of the illuminating gas at the meter by a lightning spark. It is therefore advisahle always to establish a good counection between the lightning-rods and the gas or water mains outside of the building.—*H. Wilde.*

Cotton Seed Meal.—English farmers consider cotton-seed meal one-third more valuable for feed to stock than the best corn meal.

Useful Information.

Facts About Glue.

The best method of preparing and using a substance which enters so largely into wood working processes as that above named, is a matter which should be thoroughly understood by those who have occasion to handle it. Some difference of opinion has existed on the question whether an admixture of carbonate of lime, or Paris white, which is the form in which it is generally employed, is an improvement to the quality of the glue. The most reliable experiments, however, have apparently established the fact that if very fine and pure Paris white is used, in limited quantity, and thoroughly incorporated with glue, the result will be highly advantageous, not only the appearance but the sticking quality also being improved. Bone dust has been proposed instead of Paris white, but its gritty nature is an insuperable objection; it refuses to unite with the glue, and renders it less serviceable. Similar injurious effects have resulted from employing certain chemicals, such as carbonate of soda, sulphate of zinc and oxalic acid, which have been experimented upon in compounding an opaque glue.

Transparent glue may be tested by holding it to the light, when it should show no specks, but be perfectly clean and clear. When immersed in cold water it will, if of the best quality, swell without melting, and when dried will return to its former size. After being swelled in cold water, its tenacity may be increased and liability to injury by dampness prevented by immediately immersing it in linseed oil, and heating it until dissolved. When dry, it will be proof against moisture.

In preparing glue for use, it should be first cut into small pieces, and immersed in cold water for about twelve hours. It is then placed over a fire and the temperature gradually raised until the glue is all dissolved, the softening having been accomplished by the previous steeping in cold water.

A strong liquid glue is made by combining three parts of the glue with eight parts of cold water, letting it stand for a few hours to soften the glue, then adding half a pint of muriatic acid and three-fourths of a part of sulphate of zinc, and keeping the whole mixture for ten or twelve hours at a heat of 185 degrees Fahrenheit. When cool it will remain liquid, and is highly recommended as an adhesive agent were wood, crockery or glass is to be subjected to its action. A superior quality of liquid is also obtained by dissolving gelatin or dextrin in acetic acid and alcohol. The best liquid glues, it has been found by scientific analysis, require to be surrounded by tepid water to make them assume the liquid form; those which present that condition at an ordinary temperature being usually of an inferior grade.

A somewhat novel test of the quality of glue is described by an English writer, who proceeded on the hypothesis that the glue which will take up most water is the best. He took 50 grains of glue, dissolved it in three ounces of water in a water bath, and when dissolved left it for twelve hours to gelatinize. He then placed an ounce chip box on the surface of the gelatin, and put shot into the box until it sank so far as to bring a mark previously made on the side to the level of the gelatin. The comparative strength of the different kinds of glue thus tested is denoted by the amount of shot which each will sustain before the mark is brought down to the surface. The finest glue tried by the experimentor referred to bore up six ounces of shot at a temperature of 58 degrees.

For cabinet makers' use, black glue is often selected; but the amber colored article has been proved by thorough experience to be the most suitable for that kind of work.—*Mechanic and Inventor.*

Brilliant Achievement in Wool Manufacture.—A story is told by English papers which, if true, or nearly so, very forcibly exemplifies the near approach of perfection in woolen machinery, so far at least as the annihilation of time is concerned. The story is to the effect that a gentleman in Newberry, England, recently made a wager of $5,000 that at eight o'clock on a particular evening he would sit down to dinner in a well-woven, well-dyed, well-made suit of clothes, the wool of which formed the fleece on sheep's backs at five o'clock that same morning. Two sheep were shorn; the wool was washed, carded, stubbed, roved, spun and woven; the cloth was scoured, fulled, tented, raised, sheared, dyed and dressed; the garments were made. At quarter past six he set down to dinner, at the head of his guests, in a complete damson-colored suit—thus winning the wager with one hour and three-quarters to spare. In this achievement the improved sewing machine is entitled to a full share of credit.

A Hint for Settlers.—Eighty acres is all that can now be held under the homestead act on the even sections within thirty miles of the railroad line, the odd sections being railroad land, except such as are ready secured by pre-emption. A pre-emption claim is only good to the original settler, until complete, or if conveyed to others, must run the regular time without counting the original settler's time in such purchase of an incomplete pre-emption right. One hundred and sixty acres, however, can be pre-empted on government land within the railroad line, by paying $2.50 an acre.

Useful Hints.

Why are some things of one color and some another? As every ray of light is composed of all the colors of the rainbow, some things reflect one of these colors and some another.

Why do some things reflect one color and some another? Because the surface is differently constructed, both physically and chemically, and therefore some things reflect one ray, some two rays and some none.

Why is the rose red? Because the surface of the rose absorbs the blue and yellow rays of light, and reflects only the red ones.

Why is the violet blue? Because the surface of the violet absorbs the red and yellow rays of the sun and reflects the blue only.

Why are some things black? Because they absorb all the rays of the light and reflect none.

Why are some things white? Because they absorb none of the rays of light, but reflect them all.

What is the cause of the wind? The sun heats the earth, the earth heats the air resting upon it; as the warm air ascends the void is filled up with a rush of cold air to the place, and this rush of air we call wind.

Hints on House Building.—A paper on this subject, read by Edward Roberts, F. S. A., before the Royal Institute of British Architects, closes as follows:—

1. Never allow pervious drains in pervious soils.
2. Never allow a cesspool or drain near a well.
3. Never select gravel as a building-site if well drained clay can be obtained.
4. Never allow drinking water to be drawn from a cistern supplying a water-closet.
5. Never allow waste-pipes to be inserted into water-closet traps.
6. Never allow rain-water to run to the ground if it is required above.
7. Never allow water to stand in pipes exposed to frost.
8. Never allow pipes to be fixed so that they cannot empty themselves.
9. Never ventilate except by pipes or tubes; inlets and outlets being of equal size.
10. Never use glazed earthenware pipes for upward flues.
11. Never allow chandeliers to be the exclusive light merely because it has been customary.

The following extraordinary case of spontaneous combustion is related by the New York *Insurance Journal:* A lady watching at the bedside of her husband, was astonished, about midnight, to perceive flames burst from the surface of a dressing-table from no apparent cause. Upon the table was some writing paper and the table-cover, with an open newspaper spread above them. Although alarmed, the lady was not unnerved, and cast the burning mass into a contiguous vessel, where the flames were soon extinguished. In searching her memory for a cause for this perilous incident, she remembered that a day or two previously, she had saturated some linen with sweet oil to be laid over a blister, and had left it for a short time upon the table, occasioning a grease spot on the cover. The paper was laid upon this spot. Probably, accelerated by the temperature of the room, combustion commenced on the greased cloth, communicated to the paper, and slumbered until the oxygen of the atmosphere was the final cause of the flame.

Potatoes a Century Ago.—Here is some information about the status of potatoes a century ago: This root increases prodigiously, and is very proper for feeding and fattening cattle. They are boiled in water, and require but little boiling, though they may have been kept two months in the store. Cattle eat them raw, but for the table they are wholesome boiled. I earnestly recommend the culture of this plant to husbandmen, as it is not only excellent food for cattle but good for men in years of scarcity. After a little use the taste becomes at least as agreeable as turnips, and particularly if the potatoes are boiled with bacon and salt pork. The consumption of them in the English islands is astonishing, and many are eat in the French provinces. They yield a very white meal, which mixed with wheat meal makes good bread. I have eat it when there was no more meal in it than was necessary to make it rise.

Artificial Incubation.—Those wiseacres who are forever puttering over egg-hatching machines, imagining they are going to beat mother nature, will finally learn to respect her ways. An egg has been happily pronounced a masterpiece of creation, but it is no more so than is a feather. The covering of birds combine in a wonderful manner, lightness and complete ventilation. It is a first rate non-conductor of heat, and repels dirt. Then the vital fires, consuming grain for fuel, keep up a heat gauged with more nicety than the clap trap of valves and self-regulating lamps can ever attain. We admire your ingenuity, inventors, but we want none of your artificial appliances so long as good motherly biddy is available.—*Poultry World.*

The depopulation of the Arctic coasts by the removal of the chief means of subsistence of the inhabitants is a question involving only a short time, if the rate of destruction of the seals and walrus is not soon diminished.

The cost of leeches, sold in Europe, exceeds $10,000,000 per annum. The finest are said to come from the Murray River, Australia.

Good Health.

Sleeping.

It is nothing short of murderous for one person to sleep habitually in a room less than twelve feet each way; and even then the fireplace should be kept open, and a door ajar, or the windows raised at bottom, or lowered at top, (both better;) this creates a draught up the chimney, and carries off much of the foul air generated during sleep. A little fire, or a lamp, or jet of gas burning in the fire-place, increases the draught. As the air we breathe is the chief agent for removing all impurities from the blood, the more effectual as it is purer, it must be plain to all that the room in which we spend a clear third of our entire existence should contain the purest air possible, and that this must have an immense influence on the health. Hence, our chambers should be large and airy—the higher above the ground the better—with windows facing the south, so as to have all the benefit of sunlight and warmth, to keep them dry and cheerful. Besides a few handsome pictures or paintings on the walls, illustrating what is beautiful and elevating, there should be no furniture except a table, a dressing bureau, and a few chairs, all without covering. With the exception of the bedding and a clean dry towel, there should be no woven fabric, neither carpet, curtains, nor hanging garments; for these, especially if woolen, retain odors, dust, dampness, and seeds of corruption and disease for months. There should be a hearth-rug at the bedside, to prevent the bare feet from coming in contact with the cold floor, on getting out of a warm bed. No liquid except a pitcher of cold water should be allowed to remain five minutes in a sleeping-room. The deadly carbonic acid gas which comes from the lungs at every outbreathing of the sleeper, rises to the ceiling in warm weather, but falls to the floor when the room is freezing cold. Hence, in summer, the purest and coolest air in a room is near the floor; in winter the foulest.

To Sleep Soundly.

With many the inability to sleep, as a growing habit, is the first step toward certain madness: in every disease it is an omen of ill. Hence, to cultivate sound sleep, do not sleep a moment in the daytime; go to bed at a regular hour, and never take a "second nap" after waking of yourself in the morning. Take nothing after dinner but a piece of cold bread and butter, and one cup of hot drink—*not* China tea, as it makes many wakeful. Never go to bed cold or very hungry, nor with cold feet. Read nothing after supper, listen to nothing, talk about nothing of a very exciting character; avoid carefully every domestic unpleasantness, as to child, servant, husband, or wife. Let no angry word be spoken or thought harbored for a single instant after tea-time, for death may come before the morning-light. Grown persons generally require seven hours' sleep in summer, and eight in winter. Few indeed, except invalids, will fail to sleep well who go to bed at a regular early hour, on a light supper, in a large room, and clean, comfortable bed, if there is no sleeping in the day-time, and not more than seven hours in any twenty-four are passed in bed. One week's faithful trial will prove this. Children, and all persons at school or engaged in hard study, should take all the sleep they can get, and should never be waked up in the morning after having gone to bed at a regular early hour.

Coln on the Lungs.—If a cold settles on the outer covering of the lungs it becomes pneumonia, inflammation of the lungs, or lung fever, which in many cases carries the strongest man to his grave within a week. If a cold falls upon the inner covering of the lungs it is pleurisy, with its knife-like pains, and its slow, very slow recoveries. If a cold settles in the joints, there is rheumatism in its various forms; inflammatory rheumatism, with its agonies of pain, and rheumatism of the heart, which in an instant sometimes snaps the cords of life with no friendly warning. It is of the utmost practical importance, then, to know not so much how to cure a cold as how to avoid it. Colds always come from one cause—some part or the whole of the body being cooler than *natural* for a time. If a man will keep his feet warm always and never allow himself to be chilled, he will never take cold in a lifetime, and this can only be accomplished by due care in warm clothing and the avoidance of draughts and undue exposure. While multitudes of colds come from cold feet, perhaps the majority arise from cooling off too quickly after becoming a little warmer than is natural from exercise, or work, or from confinement to a warm apartment.—*Wood's Household Magazine.*

Health of Farmers.—There are seven reasons why farmers are healthier than professional men, viz:

1. They work more and develop all the muscles of the body.
2. They take exercise in the open air and breathe a greater amount of oxygen.
3. Their food and drinks are commonly less adulterated and far more simple.
4. They do not overwork the brain as much as professional men.
5. They take their sleep during the hours of darkness, and do not try to turn night into day.
6. They are not ambitious and do not wear themselves out so rapidly in the fierce contest of rivalry.
7. Their pleasures are simple and less exhausting.

Destruction of the Germs of Disease.—As the result of a series of experiments on the destruction of low forms of life by heat, Dr. Crace Calvert demonstrates that the germs of disease will withstand a temperature of 300 degrees Fahrenheit. Exposure to such a heat as this injures the fibers of all kinds of cloth so seriously that they are unfit for further use. It is therefore evident that the mere agency of heat cannot be depended upon for the destruction of the germs or corpuscles attached to the clothing of persons who have suffered from any contagious disease.

The necessity for a change in opinion regarding the power of chlorine gas to accomplish this purpose is urged in a recent report of the New York Board of Health on the disinfection of clothing and rooms that have been exposed to contamination by small-pox. In the report in question carbolic acid is especially recommended for the disinfection of clothing and bedding, and sulphurous acid gas prepared by burning sulphur for the disinfection of rooms. The latter substance especially seems to have the power of utterly destroying the germs of small-pox, while chlorine frequently fails altogether or only accomplishes the object in an imperfect manner.

Treatment of Sun Stroke in India.—A late writer in *Public Opinion* says: "On one of the very hot days we had recently no fewer than nine men were struck down by sun stroke in the Lahore Central Jail. They were all quite insensible, and only able to breathe in the stertorous way peculiar to the ailment. The Superintendent, Dr. Lethbridge, had them laid out in a row on the cool floor of the Hospital, and there watered them copiously and continuously for five hours by means of bheeties with mussucks, before much improvement was perceptible. Every man recovered, and it is to be noted as a circumstance of considerable importance, that although all the cases were of the most serious kind, the simple remedy of a continuous and long continued supply of cool water was at last sufficient. The remedy, continued only for half an hour, and perhaps interrupted every time the mussuck was empty, would evidently have been of no avail. We recommend the account to the attention of all travelers, and, indeed, of every one liable to be exposed to the heat of the sun."

Treatment of Rheumatism.—*Cassell's Household Guide* says the treatment of rheumatism should vary, according as the rheumatism affects the muscles or the joints, and relatively to the age of the patient, and the general state of health. People of a rheumatic constitution may greatly save themselves by care in regard to a few particulars. First, the avoidance of exposure to cold, and especially to cold and wet together—flannel and other kinds of warm clothing being obviously proper. Their food, while it should be nourishing, should be simple. Beer and porter, as a rule, should be avoided—they are rheumatic drinks. When the patient can command a change of climate, one that is mild, uniform, and above all, dry, will be the best. For rheumatic pains in the muscles, as of the back or neck, one of the best remedies is to cover the affected part with a piece of flannel, and rub it over with a hot iron every night before going to bed.

Severed Toes Replaced.—A writer in the Wilmington *Commercial* says: In relation to the man whose toes were cut off, and after conveying them nearly two miles to his home and having the use of them afterward by being replaced, you wish to know if there ever was anything on record similar to it.

In reply, I would state that in 1855, while playing with a hatchet in the yard, I cut the two fore fingers of my left hand entirely off. They remained off till Dr. Baker arrived, when he sewed them on nearly one hour afterward—the same doctor that replaced the toes.

The hatchet being dull, it tore the fingers more than to cut them clean off, consequently it was more difficult to unite them, but for the past sixteen years I have had free use of them both, and the marks of the wound are scarcely perceptible.

Every humane parent will make it a religious duty to arrange that every child shall go to bed in an affectionate, loving, and glad spirit. If wakeful during the night, get up, draw on the stockings, throw back the bed-cover to air it, walk the floor in your night-gown, with the mouth closed, all the while rubbing the skin briskly with both hands, until cooled off and a little tired. Except from August first to October first, in fever and ague localities, a chamber window should be open two or three inches in length.—*Dr. Hall, on "Sound Sleep."*

The Teeth in the insane are prone to undergo certain changes. Dr. Langdon Down, who read a paper on this subject recently before the Odontological Society, states therein that from the examination of nearly one thousand cases he has found that he could in the majority of instances state the period at which the imbecility or insanity began.

Poisoned Air, that so frequently gains access to rooms from the sewers, is the cause of many an attack of fever. All contamination from this source may be avoided by relieving the pressure on the traps of the waste-pipe by means of a tube communicating with the open air at the top of the house.

The Insane in the Surrey County Asylum, England, have been treated to a course of private theatricals with excellent results. The patients were spectators, not performers.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, May 11, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, May 8, 1872.—Legal Tenders buying, 90¼; selling, 91. Gold in New York to-day, 112.

Table of Contents.

ILLUSTRATIONS.—Sutter's Mill—Where gold was First Discovered, 189. The Wild Pigeon of California, 294. Artesian Wells, 296. Improved Car Coupling, 297.

EDITORIALS—We Commend the Pleasures of the Glass; Wild Flowers; Artesian Wells in Nevada, 294. Mining Stocks, 296. The Earthquake Underground; Death of a Capitalist; A Sensational Affair, 296.

CORRESPONDENCE—The Mines of Utah, 290.

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 292-3.

MECHANICAL PROGRESS.—The Physical Properties of Steel; Early Iron Making in England; Utilization of Slags; Phosphorized Bronze for Guns; Browning Gun Barrels, 291.

SCIENTFIC PROGRESS.—The Relation of Science to Religion; Brandy From Wood Shavings; Surface Electricity; Elevation of Polar Lands; A New Hygrometer, 291.

USEFUL INFORMATION.—Facts About Glue; Brilliant Achievement in Wool Manufacture; Useful Hints; Potatoes a Century Ago, 295.

GOOD HEALTH.—Sleeping; Cold on the Lungs; Destruction of the Germs of Disease; Treatment of Sun Stroke in India; Treatment of Rheumatism; Health of Farmers; Severed Toes Replaced, 295.

DOMESTIC ECONOMY.—Relishes for Tea; Hints for House-Furnishing; Washing Summer Clothing; To Bake Tongue; Oyster Soup; Meat Balls, 299.

MISCELLANEOUS—Lead in Oregon; Sleep and Lodging; Lime in the Haymow, 290. The Useful and Beautiful, 298.

RICH SPECIMENS.—A number of beautiful specimens are on exhibition in a jeweller's window on Montgomery street, from the Cedarburg mine, in El Doredo county. The gold is leaf and thread gold, and the appearance of the rock is very handsome. The specimens are very appropriate for cabinets, and will doubtless find their way into numerone collections. A howl of gold, 69 onnces, is also shown, and attracts considerable attention.

THE FREAR STONE.—We would call the attention of builders and others interested, to an advertisement of a company of gentleman about to commence the manufactnre of thie patent stone in San Francieco. It ie an important enterprise, and we shall have more to say about it after seeing specimens.

MASTODON IN COLORADO.—Capt. Berthoud has recently discovered a portion of an elephant or mammoth tusk two feet, eight inches long, and eight inches in diameter, ten or fifteen feet below the surface, in the gold-bearing gravel of the Patch or Hill diggings, in Clear Creek Valley, five miles above Golden, Colorado.

THE French Corral Ditch, when completed, will be about 50 miles long, and he of great importance to the mining interests of Sierra and Nevada counties. It will furnish water to many claims along the line which have been lying idle for want of it.

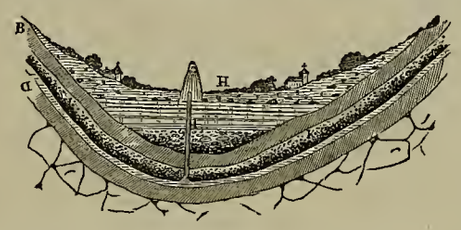
WE have received a box of specimens from W. C. McDougall which we have not yet had time to examine.

Mining Stocks.

The long expected decline in the mining stock market has come at last, and everything has dropped to a comparatively low fignre, most of them to the prices ruling before the excitement. For the last few weeke those who had loet by etock speculatione were few, now the exception has become the rule, and long faces are plenty on California etreet. The only advance to note in the market ie the Crown Point, the value of which is admitted by all, and which most probably assisted in infleting many other descriptions far above their real value. There is no doubt, however, of the existence of large and valuable bodies of ore in some of the mines that have dropped, and it is to he eupposed that those deecriptions will again rise to a properly proportionete value, and es usual cerry up adjacent mines with them.

On Friday, the 3d, etocks were generally strong, and Crown Point rose to $1,750 cash and 1,800, huyer 30. Crown Point advanced over the previous day $150, Imperiel $60, Confidence $55, Yellow Jacket $50, Hele & Norcroes, Overman and Savage, each $25, Alpha and Segregated Belcher, each $10, Exchequer $20, Caledonia $5, Eclipse $4, Sierra Nevada and Trench, each $6, Chollar Potosi $250, Belcher declined $50, Gould & Curry $30, Ophir $8, Consolidated Virginia $5.

On Saturday the 4th inet., the market was weak and nearly everything wae lower.



Hale & Norcross declined $105 from previoue day'e eales, Kentuck $70, Bullion and Imperial, each $50, Cholla Potoei $42.50, Savage $65, Alpha $40, Gold & Curry and Yellow Jacket, each $30, Exchequer $22, Caledonia $21, Overmen $20, Consolidated Virginia $13, Segregeted Belcher $5, Sierra Nevada $4, and Buckeye $3.

On Mondey the 6th inst., the market was again weak. Alpha advenced $15, Choller Potosi $5 to 10, Crown Point eold at $1,900, Hele & Norcroes advanced $25, Gonld & Curry $20, Ophir $8, Savage $20, Yellow Jecket $5, Belcher declined $50, Caledonia from $5 to $7.50, Consolidated Virginia $25, Kentuck $60, Overmen $20 and Exchequer $3.

On Tueeday business was very light, the lighteet for eome time pest. Gold & Curry declined $70, Yellow Jacket $75, Imperial $85, Confidence $65, Segregated $60, Belcher $50, Overman and Savage, each $45, Alpha $20, Exchequer $10, Caledonia, Hale & Norcrose and Ophir, each $5, Sierra Nevada $8, Choller Potosi gained $50, and Crown Point sold at 1,825 against the lest previoue cach sale of $1,750.

We dnesday everything went down fear fully and the generel weak tone of the market resulted in a panic. Beicher declined from noon the day hefore $300, Alpha, Ophir and Yellow Jacket, each $40, Kentuck $75, Savage $35, Consolidated Virginia, Hale & Norcroee and Segregated Belcher, each $25, Caledonia $32.50, Chollar Potosi $82.50, Exchequer $10, Sierra Nevada $7, Imperial $5, and everyth ing else in proportion.

On Thursday stocks recovered slightly from the day hefore, though the market was still weak; Crown Point sold from $125 to $175 lower than on Tuesday. Gould & Curry dropped $45 from eame Board, and Imperial $85; Hale & Norcrose wae $5 and Chollar Potoei $250 lower.

From the closing eeles on Wedneeday noon Belcher advanced $200, Caledonia $40, Segregated Belcher $27.50, Kentnck $25, Savage $320, Confidence $20, Alpha and Exchequer each $15, Ophir and Overman each $10, and Sierra Nevada $5.

The chief reaeon in the break in etocks is most probably a want of confidence in the unusnally high prices which have prevailed for eome time and a general desire to realize. The reports from the most of the mines are encouraging, although out of the 150 mines called at the Board only four or five are paying dividends. The Belcher declares $312,000 payahle on the 10th inst., and has paid five this year, one of $10, two of $15, one of $20 and this one ie $30, making in all $936,000. The Crown Point paid one of $10, two of $15, one of $25, and the one payable this month ie $40, aggregating $1,260,000. The Meadow Valley hae paid two dividende of $1.50, and one of $1, aggregating $240,000. The Reymond & Ely in four dividends has paid $660,000. The total for four months of all these minee ie $3,036,000. The decline in Yellow Jacket occurs in the fece of important discoveries, and the connection of the ore in the Hale & Norcross, and Chollar ie known, yet the latter etock is depreesed. The Raymond & Ely yielded $317,710 in April. Reports from White Pine minee are favorable, ae the roeds are open and the accumnlated ore on the dumps will now be milled. The Washoe mines are all in a flonrishing condition as the local papers would eeem to indicate.

The nnmber of newly incorporated mining companiee this week is large, ehowing that confidence in mining mattere is not lost, and eeveral companies are about increasing their cepital etock. Whether pricee will go lower or again rise, remaine to be eeen. The rise in etocks resulted beneficially in one way at least—that of creating new companies to develop mines in known regions under the eupervision of men well known in the community. Some of theee enterpriees will of course amount to nothing, hut among them all, they cause an activity of trade, and eome of them ought to increase the demand for labor end at the same time increese our bnllion product. The new mining law has given considerable impetus to mining affairs, and has inspired confidence among investore, and it ie to be hoped that the actual development of ore will be the object of new organizations end not the profit likely to ecrue from the fluctuations of stock. Stock dealing itself does not assist in the increase of generel wealth, but by attracting the attention of men of meane to our mineral resources it will exert a beneficial influence.

The excitement that has lately existed, has however, had a demoralizing tendency on the community, for everybody went in on general principlee without regard to anything, eave the chance of making money rapidly. Many people now find themeelves considerahly poorer if not wiser. Still eome continne to buy largely, in hopee of realizing by a turn in the downward movement. The large amount of money expected from dividends and the general prospects from the mines, inspire many with a helief that the tone of the market will again change favorahly, and confidence be renewed. The recent excitement is unprecedented in the history of our mines, and pricee have reached a figure that few ever dreamt of, though it ie eomewhat singular that etock in minee ehowing no immediate prospect of paying a dividend, eell higher than those which are actnelly paying them now.

The dividende this month are handsome ones and the owners of eome of the mines are fully justified in their expectation of a continuance. It is eeid thet the money market here ie eesy and there is no difficulty in legitimate borrowers getting accommodated. The bullion yield continuee unabated. We hope new that the excitement is over that many of those persons who have tried their luck in etocke will turn their attention to mining itself as a legitimate investment not ae a etock operetion, for the mining intereete of this Coaet fer from being on the decline or an experiment are jnst beginning to become what they should be—the leading interest. Stock epeculations are to be deplored by all mining men eince they generally do more harm than good to the bueineee. As we go to prees etocke again ehow an upward tendency, and it ie eupposed by many that they will regain the lately ruling high prices.

Artesian Wells.

What are arteeian welle? According to Buckland, in hie celebrated Bridgeweter treatise on geology, the name of Arteeian well ie applied to any perpetually flowing artificial fountain obteined by boring through etrata, that are destitute of water which will ascend to the surface, into lower etrate charged therewith. The name is derived from *Artois*, (the Artesium of the ancient Latins) where the making of euch wells has for a long time been practiced.

The reaeon why water will eometimes rise to or above the eurface, throngh a bore hole in the earth, is shown by the following diegram: Suppoee *B* and *D* to be two etreta of clay, or eome formation impermeable to water, and *K* be a stratum of eand or gravel hetween them. The rain that falls on the hille at either side will filter down through this sand or gravel, and collect in the hollow between the cley etrate where it cannot eecape. If now we bore down to *K*, the water thus confined will rise to the enrface at *H*, or coneiderably above it. The hight will depend upon the pressure of water which has accumulated in the eloping epece between the impervioue beds. It will be readily understood that it is only where the natnre and arrangement of the geological etrata are euch ae we have described, that an artesian well is possible.

Artesian Wells 4,000 Years Old.

Although artesian wells took the name by which they are now known from a French proviuce, where they were firet employed in Europe, only about 600 yeare ago, there are euch wells actually exieting which are known to be thousands of years older than the history of Artoie. Artesian wells were sunk in the vicinity of ancient Thebes, when thet city was at the hight of its prosperity, or not less than 4,000 yeare ago. They were sunk hy firet excavating shafts or wells from eix to eight feet in diemeter, through about 80 feet of clay and marl, from the bottom of which six and eight inch wells were bored or drilled through ahout 300 feet of limeetone. At the bottom of this limestone the water-hearing sands were met from which the water seemed to have risen and run over the top of the excavated well.

According to Professor Anstead, some ench wells which were sunk in the Libiyan Deeert have been cleaned out in modern times, and euccessfully restored to nee. Other wells, of very ancient but unknown date, were suuk by the Chinese, who have long known and used this method of ohtaining water.

The Sitka silver excitement is likely to euhside eince the rock from there has been assayed.

The Earthquake Underground.

One of our correspondents in Inyo Co. writes us and says that he has seen a statement that is going the rounds of the press, that the earthquake of March 26th was not felt in the mines at Benton at a depth of 200 feet. He says that it is true the shock was not felt there, for the simple reason that no one was in the mines at the time, but subsequent ones have been very distinctly perceived underground. This statement, from a reliable gentleman, will overthrow the misstatements which have heretofore appeared, and which were likely to mislead those who usually look below the surface of all questions of a scientific nature.

Another correspondent writing on the same subject says that the statement that the miners underground at Cerro Gordo did not feel the shock of the 26th of March, is far from being the case. The big shock was felt quite as severely 400 feet below the surface as it was in the open country above. Nearly all the miners dropped their tools instantly and hurried to the surface with all possible dispatch, nor did they venture below again until the second day after the shock. In the Union Mine a cave of 20 tons or more of dirt occurred, completely shutting up the main shaft from the tunnel. The whim horses in the mine, stalled some 500 feet from the surface, were so badly frightened as to become quite unmanageable, nor did they acquire their usual feeling of security for several days afterward.

Although many of the subsequent shocks were not felt by the miners of the Cerro Gordo underground, it is noticeable that some of the lighter shocks—mere vibrations—were felt at a depth of 400 feet, vertically from the surface. Our correspondent states that in order to satisfy themselves in this point the miners constructed two self-registering indicators, placing one in the place of residence on the surface, and the other at the end of an adit, where perfect stillness prevailed, and at a depth of 450 feet vertically from the surface. The result of the first trial of twelve hours was a record on each at the same hour and minute—five shocks being recorded in the twelve hours. But one of the five was felt by the miners working 100 feet distant. Only three were felt by persons above ground. The second trial corroborated the first—three shocks being recorded in each place. The general opinion there is that with properly constructed instruments that at no depth attained in the mines do the shocks cease to be felt.

Death of a Capitalist.—F. L. A. Pioche, well known as a capitalist and friend to the mining interests of this coast, and in whose honor the town of Pioche was named, committed suicide in this city last week. By a provision of his will his paintings, drawings, sketches and engravings and objects of art, his books and mineralogical, geological and conchological collection are to be given to the University of California. He bequeaths, also, $5,000 to cover the costs of arranging and classifying them, and requests that a room be set apart for their special accommodation, which shall be open to the public freely at fixed and frequent periods, as is the case with museums in Europe, so that students and patrons of the arts and sciences may there instruct themselves and increase the sphere of their studies and their knowledge of facts that may be of use to hasten the progress and development of this country. The collection of minerals, etc., is a fine one and will be a valuable addition to that already belonging to the University. It might be well for the Regents to add a little more to the money left by Mr. Pioche, and make a place large enough for them to exhibit their whole collection, which now lies out of sight in the rooms of the State Geological Survey, and is of no practical use as far as instruction to students is concerned.

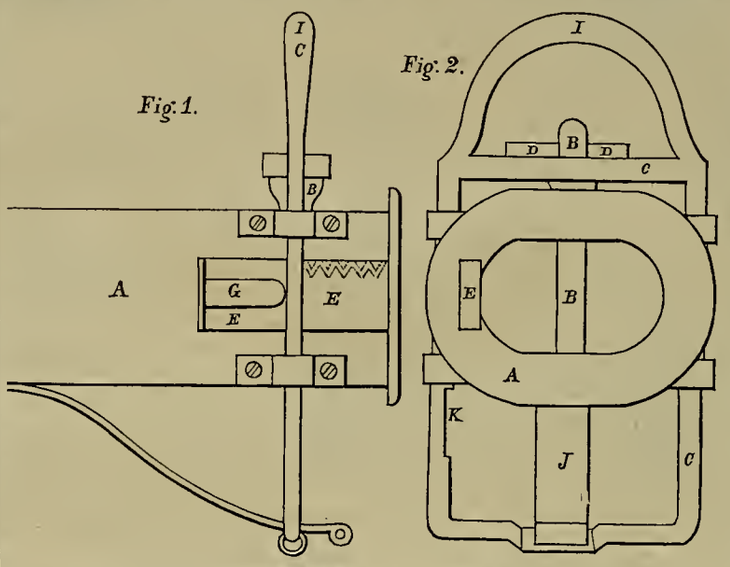
An Improved Car Coupling.

The accompanying cut represents an improvement in car couplings, recently patented, which is operated automatically, and is intended to facilitate the coupling together of a train of cars without danger to life or limb, and to facilitate the uncoupling of the same by an attendant on top, or at the side of the cars.

Figure 1 is a side elevation, and figure 2 an end view of the car coupling. *A* represents the bumper, *B* the coupling pin, secured to the vertical sliding frame *C*, by the key *D*. *E* is a sliding bolt, provided with a suitable spring, shown in the dotted lines, and also provided with a stop lug, or projection, *G*. To the handle *I*, forming part of the frame *C*, suitable rods or chains lead to the top of the car, or may be attached to the side by means of a pulley, bell-crank or lever, as deemed advisable.

The drawing represents the position of the different parts when the cars are coupled; the car having the usual link is secured to the coupling in this improvement by means of the pin *B*, the pin *B* and the frame *C* being held down by the spring *J*.

When the handle *I* is grasped, and the



AN IMPROVED CAR COUPLING.

frame *C* is drawn upward until the notch *K* comes opposite the stop *G*, the spring shown by the dotted lines will cause the bolt *E* to move upward and project beyond the face of the bumper; and the lug, or stop, *G*, will prevent the frame from being drawn downward by the spring *J*, when the handle is released and the bolt, or coupling-pin, *B*, has been drawn up so as to release the link, the uncoupling will have been effected and the apparatus ready set for automatically coupling the next car, by the impact of the bumper of said car with the projecting end of the sliding bolt *E*. This sliding bolt will be forced back by the impact until the stop, or lug, *G*, has passed out of the notch *K*, when the frame *C* is drawn by the spring *J* to the position shown in the cut.

By the means above described the old-fashioned method of making a man go between the cars, hold the link and put in the pin, is entirely done away with, and a safe and convenient one adopted. The cars are coupled by the impact and are uncoupled by a person stationed on top of the cars, or by means of a chain or rod leading to any desired position, without danger to the operator. No attendant is required, of course, to couple the cars. Further information concerning this patent may be had from R. O. Tripp, of Woodside, San Mateo county, Cal.

An important suit is now in progress in Nevada between the Hidden Jewel and Lemon mining companies for the possession of a valuable mine in Eureka District.

A Sensational Affair.—Quite a sensation was created in this city on Wednesday by the publication of a series of rumors, which had been quietly circulated in stock circles for several days previously, relative to the alleged origin of the fire which occurred in the Yellow Jacket mine some three years ago, and by which thirty-eight lives were destroyed. The principal parties involved in the trouble are two well-known and wealthy mine and stock operators—William Shaw and J. P. Jones. It is alleged that the former gentleman charges the latter with having caused the fire alluded to, and has endeavored to suborn a witness to testify in the matter. The charge is indignantly repudiated. An unfortunate condition exists in the fact that the two are bitter political rivals, and have been on unfriendly terms for some time past. Disclaimers are put in all round.

The effect of the publication was the creation of an intense excitement on the street and a breaking down in the stock market. Public sympathy is mostly with Mr. Jones, against whom the shaft has been hurled. We refrain from entering into any particulars, as we presume the whole matter will be made the subject of judicial investigation, whereby the full facts will be elicited, and justice be meted out to all parties concerned. The affair appears to be one of a purely personal and partisan nature since affidavits seem to be sought for publication, rather than information for the procurement of indictments, by which the ends of justice, simply, might be reached.

The Cedar Creek Gold Mining Company have put their stock on the London market, with a capital of £200,000 in 40,000 shares. The mines the new company propose to purchase, are in Dutch Flat and Gold Run, in Placer county, and are gravel claims to be worked by hydraulic process. The water rights of the company are extensive. The purchase price is £190,000, of which £90,000 is in shares.

The Peat Discoveries.—A dispatch from Los Angeles states that the commission appointed by the Common Council to examine the peat deposits, recently discovered between that place and Wilmington, have returned with samples of a fair quality. Investigations will be made to ascertain its true thickness and value at different points between Los Angeles and the sea coast.

The House Mining Committee in Congress have agreed to report favorably on the bill, providing that the United States shall guarantee the payment of the interest on the Sutro Tunnel at a par value of $2,000,000.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending April 30th, 1872.

Knee-Brace for Sewing Machines.—Francis E. Mills, New York, N. Y., assignor to Mills Treadle Manufacturing Company, San Francisco, Cal.; antedated April 18, 1872.

Apparatus for Amalgamating Precious Metals.—Edwin J. Fraser, San Francisco, Cal.

Stave Machine.—Lamartine R. Fulda, San Francisco, Cal., assignor to himself, Martin Fulda, and Henry C. Fulda, same place.

Water-Wheel.—Morgan Hungerford, San Francisco, Cal.

Wagon-Tire Tightner.—John Kafader, Jacksonville, Oregon.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

---

Scientific Works.—The Mercantile Library received by last steamer a collection of scientific and miscellaneous works from Victoria, Australia, most of them printed under the auspices of the Colonial Government. Among them is a book embodying the results of meteorological observations taken there from 1859 to 1860, and the nautical observations collected at the Flagstaff Observatory, Melbourne, during the same period; a work by Ferdinand Muller with analytical drawings of Australian maps, plants indigenous to Victoria; vegetation of the Chatham Islands, Victoria; matters relating to the gold fields of Victoria; abstracts of specifications in connection with the preservation of wood, etc., etc. There are eighteen volumes and four pamphlets, some of the scientific works being fine specimens of typography and containing superior engravings.

Discoveries.—The Merced *Tribune* says that a gravel claim with good indications was discovered two weeks since on the Merced River, in Merced county, about 1½ miles above Merced Falls.

A rich gravel strike south of the Canada Hill Mill is reported by the Nevada *Transcript*. The channel is supposed to run through Grass Valley, and into the Rough & Ready Townships, and to be the same which the Murchie Bros. have been working with such good results. The gold is very coarse, and the last run cleaned up $15 per day to the hand.

Quicksilver.—The Oakville quicksilver mine has recently developed a fine body of rich ore, which has so far been sunk upon 20 feet without the miners having gone through it. It is to be hoped that all the mines in that section of country will be equally as successful, when we may hear of this essential metal being quoted at much less than 85 cents per pound. It is said that this mine has 1,300 tons of ore on the dump, including 200 tons of a very rich quality. A new furnace is shortly to be erected.

Fires.—A fire occurred in the Uncle Sam shaft, at Gold Hill, on the 26th ult. No work has been done through the shaft for some time, and the hoisting works were being removed at the time of the fire, having been purchased by the Baltimore Company.

The IXL mill, near Unionville, Montana, was burned down recently. It was built in 1866, and cost $30,000; was worth, at the time of destruction, about $20,000. The origin of the fire is unknown.

Oregon Lead.—Some of the ore from the newly discovered lead mine at the foot of the Cascades in Linn county, Oregon, has been assayed, and, according to the *Oregonian*, yielded 60 per cent. lead, and about $18 per ton in silver. The mine is known as the Washington, and has been incorporated. The same class of ore is reported to have been discovered near Tillamook.

Domestic Economy.

Relishes for Tea.

Spiced Veal.—Chop three pounds of veal steak, and one thick slice of salt fat pork, as fiue as sausage meat; add to it three Boston crackers, rolled fine; three well-beaten eggs; half a teacup of tomato catsup; a teaspoonful aud a half of fine salt; a teaspoonful of pepper; and one grated lemon. Mould it into the form of a loaf of bread, in a small dripping-pan; cover with one rolled cracker; and baste with a tea-cupful of hot water and melted butter, with two tablespoonfnls of the butter. Bake for three hours, basting every little while (this makes it moist). Make the day before it is desired for the table; slice very thin, and garnish with slices of lemon aud bits of parsley.

Melton Veal.—This is a standard dish at the Melton Races in England, and is composed of alternate slices of veal and ham. Butter a good-sized bowl, and slice as thin as possible six hard-boiled eggs, then line the bowl with the slices. Place in the bottom a layer of raw veal steak in thin slices, and sprinkle over it a small quantity of salt, pepper, and grated lemou-peel; proceed in the same way with thin slices of raw ham, but leave out the salt. Fill up the bowl in this manner. Cover it with a thick paste of flour and water, so stiff as to be rolled out. Tie a double cotton cloth all over the top and boil three hours, putting it into boiling water at the first, and keeping the water just below the level of the bowl. When cooked, take off the cloth and the paste, and let the veal stand until the following day; then turn it on to a platter, and cut very thin after it comes to the table; garnish with sliced lemon and parsley. It is "a dainty dish" to set before a king. It is also delicious as a side dish for dinuer, aud makes a good breakfast.

Potted Shad.—Cut a fine shad into three or four pieces, omitting the tail and head; place a piece iu a small stone jar, sprinkle well with salt, and whole allspice, aud whole pepper-corns; fill up the jar in this manner, and cover the shad with sharp cider vinegar. Cover the jar with a stiff paste, and bake iu a slow oven for three or four hours. If the vinegar is strong it will dissolve all the small bones of the shad, and the large oue should be removed before baking. This will keep, in a cool place, if tightly covered, for five or six weeks; so it is well to pot three or four shad at once. It is a delicious relish for either breakfast or tea.

Potted Beef.—Take eight pounds of lean rump steak, put it into a stone jar, with a tea-cup of boiling water, a level table-spoonful of salt, a teaspoonful of pepper, and a few whole allspice, with one onion chopped fine. Cover with paste and bake for three hours. Turn out all the liquor, and take out the meat into the chopping-bowl. Pound it fine with the pestle; season with half a tea-cup of catsup. Taste it, and if not highly seasoned add more salt and pepper. When perfectly fine press iuto moulds, or small cups; and if desired to be kept for six weeks, cover the tops with melted butter so thickly that no meat is seen. Wet the moulds or cups with water, and the beef will turn out in form.—*Scribner.*

A Most Excellent Domestic Confection.—This is the season for oranges. The peel of this fruit, preserved in sugar, is one of the most delightful confections which a family can use, far euperior to the extracts sold in the shops. The peel should of course should be perfectly clean, and should be cut in loug thin strips. Stew in water till all the bitterness is extracted. Throw away the water and stew again for half an hour in a thick syrup made of a pound of sugar to one of peel, with just water enough. Put away, in a cool place, for flavoring puddings, pies, etc. For this purpoeo, it should be chopped very fine. No better or cheaper flavoring can be furnished to a household.

Storing Ashes in Woonen Vessels.—A great many conflagrations originate from the embers of wood ashes. When a few quarts of embers are thrown into a barrel of ashes, or into a bin of wood ashes, a second combustion often occurs slowly, until many bushele have been burned over. Then, as the smouldering fire reaches the boards or the staves, the wood will soon be ignited. Insurance ageuts should make particular inquiry on this point; and, if the insured will persist in the practice of storing their ashes in wooden vessels, they alone should be the losers if their buildings take fire from such a cause.

Cracker Pies.—Roll six crackers fine and put them in a four-quart pail or kettle, pour over them three-fourths of a pint of vinegar, two cups of molasses, and a quart of boiling water. Boil on the stove half an hour, adding more water, if necessary, to make quite thin. Add salt, raisins and all kinds of spice, and make short crust for four pies. Bake about twenty minutes, or until the crust is done. A little sugar may be added before the top crust is put on.

Corn Bread.—Take four cups of sour milk, one of these partly filled with cream; one egg, a little salt, two even teaspoonfuls pulverized soda; mix the soda with a little corn meal, and stir altogether, till it foams; then add corn meal till a thin batter is obtained, and pour into hot tins, oiled, an inch deep, and bake in a quick oven.

Hints for House-Furnishing.

With the return of spring the hearts of housekeepers are turned to their houses. It is astonishing how dingy now appear articles of furniture that have hitherto quite satisfied us; how we long to renew the freshness of our rooms as the earth renews her verdure. It is easy enongh to do this where there is plenty of means at commaud,—to do it, at least, in a certain way,—but to do it satisfactorily requires no less taste than money. Some of the ughest rooms we have ever seen, have been those on which no expense has been spared. The compensations of a limited income may often be seen in the thoughtfulness which it compels both in dress and house-furnishing. Very few of the tradesmen concerned with the fitting up of interiors are to be wholly trusted in matters of taste. It is worth while for all, especially those with moderate means, to make these things a study; to educate the eye, as far as possible, so that they may not make mistakes of color and form which they cannot afford to repair speedily.

Philip Gilbert Hamerton, in his *Thoughts About Art*, drops many useful hints on the decoration and furnishing of houses. "A house," he says, "ought to be a work of art, just like a picture. Every bit of furniture in it should be a particle of a great composition, chosen with reference to every other particle. A grain of color the hundredth of an inch across, is of the utmost importance in a picture, and a little ornament on a chimney piece is of the utmost artistic importance in a house. A friend of mine, who really understands painting, is so exquisitely alive to harmony of color, that I have seen him exclude a penholder from a large room because its color was discordant. This may be carrying matters a little too far, but the principle is correct. There shonld, of course, be some dominaut color in every room, and whatever fails to harmonize with it should be kept as much as possible iu the background if it be impossible to exclude it." But the harmonies of color, according to Mr. Hamerton, are just what are least understood, and he goes on to teach us by illustrations from Nature, that blue and green, contrary to the milliner's dictum, are, or may be, in exquisite harmony when used in the decoration of our houses. —*Scribner.*

To Bake Tongue.—Parboil the tongue and skin it as for roasting; trim it neatly, mince two boiled onions, a bunch of parsley; mix with these three tablespoonfuls of fine crumbs seasoned with a drachm of cayenne, aud a blade of mace and six cloves pounded; spread the seasoued crumbs over the tongue, and cover them with bacon cut as thin as possible. Roll up the tongue with the thick part in the middle, put it into a small baking-pan, cover it with broth or stock, put it into the oven and let it bake slowly from three to four hours. When taken out, put it into the mould and press it till cold. It makes a pretty dish for breakfast or lunch.

Oyster Soup.—Take one quart of oysters and separate them from the liquor, wash them thoroughly in a pint of water, strain the liquor, add one pint of milk, some mace, nutmeg and pepper, with three crackers pounded fine, and one-fourth pound of butter, boiled all together about five minutes; take it off the fire; when about to serve up the soup, put in the oysters and let it boil one minute. The soup will then be ready for the table. For each quart of oysters a pint of milk must be added, and every other ingredient in proportion to the quantity required. Three pints of oysters are sufficient for eight persons.

Meat Balls.—A savory way of preparing meat, is in the form of meat balls made thus: Cold boiled or raw beef or pork chopped very fine, put into a dish, together with eggs—one to each half pound of the meat—crumbs of light bread, soaked and mashed fine, a couple of medium sized onions chopped, (may be omitted, if not liked), season to taste, with salt, if the meat is fresh, pepper, nutmeg and allspice, and form into egg-shaped balls with the hand; if too moist to form well, add a little flour, and fry in plenty of lard.

Wet Coal Dust.—Coal dust burns better when moistened. The moisture helps it to coke, and if the back part of the fire is bright red, the steam being decomposed, acts as so much additional fuel, the oxygen promoting the combustion, and the hydrogen inflaming.

Tomato Custard.—This is said to be a beneficial diet for consumptives. It is made by straining finely stewed tomatoes through a course seive, and adding two pints of milk and one pint of tomatoes, for four eggs and one teaspoonful of sugar. Bake in small cups quickly.

Excellent Crackers.—To fourteen cups of flour, add one cup of lard, two teaspoonfuls of soda, four of cream tartar. Rub the ingredients well into flour, then add three cups of water, work thoroughly and back quick.

Omlette.—Six eggs, beat the whites and yolks separately until very light, then stir together; add no salt as it will make it heavy. Put on a hot griddle slightly greased with butter; when nicely browned, turn—serve hot.

Muffins.—Three eggs, one cup sweet milk, one small teaspoonful of soda, two of cream of tartar, a piece of butter the size of an egg, three cups of flour. Bake in muffin rings, in a quick oven.

Washing Summer Clothing.

Summer suits are nearly all made of white or buff linen, pique cambric or muslin, and the art of preserving the new appearance after washing is a matter of the greatest importance. Common washerwomen spoil everything with soda, and nothing is more frequent than to see the delicate tints of lawns and percales turned into dark blotches and muddy streaks by the ignorance and vandalism of a laundress. It is worth while for ladies to pay attention to this, and insist upon having their summer dresses washed according to the directions which they should be prepared to give their laundresses themselves. In the first place, the water should be tepid, the soap should not be allowed to touch the fabric; it should be washed and rinsed quick, turned upon the wrong side, and hung in the shade to dry, and when starched (in thin boiled, but not boiling starch) should be folded in sheets or towels, and ironed upon the wroug side, as soon as possible. But linen should be washed in water in which hay has been boiled or a quart bag of bran. This last will be found to answer for starch as well and is excellent for print dresses of all kinds, but a handful of salt is very useful also to set the colors of light cambrics and dotted lawns; and a little beef's gall will not only set, but brighten the yellow and purple tints, and has a good effect upon green.—*New York World.*

Potato Yeast.—Pare, wash and grate four good-sized potatoes, add to them one-half teacupful of salt, two-thirds teacupful of sugar, pour over this mixture one quart of boiling water, and when luke-warm add one cup of good yeast, and let it riso. It does not keep quite as long as hop yeast in hot weather, but makes sweeter bread. If kept in a cool place it will keep two or three weeks in summer and double the time in winter.

Cookies.—One teacupful of butter, one of thick cream, two of sugar, one coffee-cup of milk, one teaspoonful of soda, two of cream of tartar, half a nutmeg, and flour to knead soft. Bake in a quick oven.

Butter Sponge Cake.—One cup butter, two cups sugar, one and one-half cups flour, six eggs, one teaspoouful of soda. Dissolve the soda in a tablespoonful of milk; rub the cream of tartar evenly in the flour.

Cocoanut Jumbles.—One pound of butter, three-quarters of a pound of sugar, three eggs, one pound of flour; add by degrees a grated cocoanut, so as to form a stiff dough. Bake in a quick oven.

The following short rules for the care of furniture are from an article in the *Technologist:* "Keep water away from everything porous, alcohol from varuish, and acids from marble."

Lemon Cake.—Three cups sugar, one cup butter, one cup milk, five eggs, one teaspoonful of soda, four cups flour; peel and then grate three lemons, with very little of the rind.

Bar soap should be cut into pieces of a conveuient size, and laid where it will become dry. It is well to keep it several weeks before using it, as it melts fast when it is now.

Cream for Coffee.—Beat one egg, sweeten with one spoonful of sugar, pour on to this one pint of water. Make over night for use in the morning.

Graham Biscuit.—One pint of sour milk, one large teaspoonful of soda, salt, stir very thick, and bake on a griddle. They are delicious.

How to Preserve Soap Grease.—Fill a cask half full of good strong lye and drop all refuse grease therein. Stir up the mixture once a week.

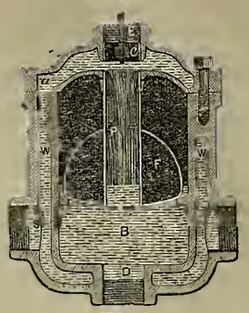
The Useful and Beautiful.

There are really two ways to do a thing well. The one studies utility and economy without any regard to how it will look. The other includes both, and in addition, the doer is often influenced by taste, giving the preference ever to that way of doing a thing, which shall most directly promote the beautiful in union with the useful. Taste displays itself in the selection of the site for building, the plan and style of architecture, planting trees, making fences, laying out grounds, the color of buildings, etc. Some in these display taste; others seem to show an utter want of, or disregard of it, everything seeming to be done with reference only to the most short-sighted utility.

Attention to matters of the kind mentioned, would soon produce a favorable change in all our rural regions. Much has indeed been already done, toward the bringing about of this desirable change, but much more can be done. What we would say then is,—let every farmer study to make his home as beautiful and attractive, as his farm is useful and productive.

Changing the Colors of Flowers.—The Mirror of Science says that a case is known of a yellow primrose which, when planted in a rich soil, had the flowers changed to a brilliaut purple. It also says that charcoal adds great brilliancy to the colors of dahlias, roses and petunias; carbonate of soda reddens pink hyacinths, and phosphate of soda changes the colors of many plants.

CRAIG & BREVOORT'S
Patent Condenser for Steam PUMPS, &c.



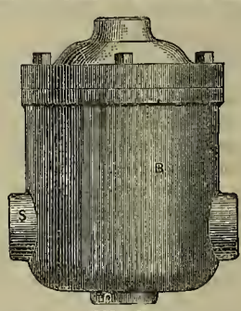
NO. 1.

The annexed engravings represent a Coudenser intended to he attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is holted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

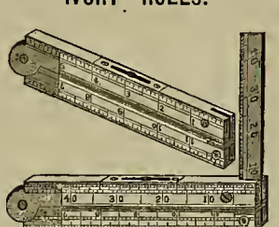
STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address STEPHENS & CO.,
18v24-3m Riverton, Conn.

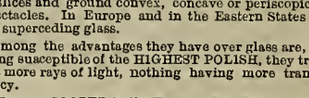
5v24-6m-1amr 108 Battery street, S. F.

"Clear as Crystal."



PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,
OPTICIANS,
No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

☞ Pebbles sold as anch by us, are Warranted.
15v3awbp3m

$1,000 REWARD! For any case of Blind, Bleeding, Itching, or Ulcerated Piles that **Dr Bing's Pile Remedy** fails to cure. It is prepared expressly to cure the Piles and nothing else. Sold by all Druggists. Price $1.00.
C. F. RICHARDS & Co., Agents, corner Clay and Sansome streets, San Francisco, Cal.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alleghany Consolidated Gold Mining Company—Location of works, Alleghany, Sierra County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1872, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, 37 New Merchants' Exchange, California street. Any stock on which said assessment shall remain unpaid on the third day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 37 (third floor), New Merchants' Exchange, California street, San Francisco ma4-4t

Eagle Quicksilver Mining Company---Location of works, Santa Barbara County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 8th day of May, 1872, an assessment of $40 per share was levied upon the mines of said company, payable immediately in gold coin of the United States, to the Secretary at his office, room 5, No. 302 Montgomery street, San Francisco, California.

Any shares upon which said assessment shall remain unpaid, on Thursday, July 11th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, July 13th, 1872, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 15th day of July, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office—Room 5, No. 302 Montgomery street, San Francisco California. WM. H. WATSON, Secretary. ma.11.

Francis Mining Company---Location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 6th day of April, 1872, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 14th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 4th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

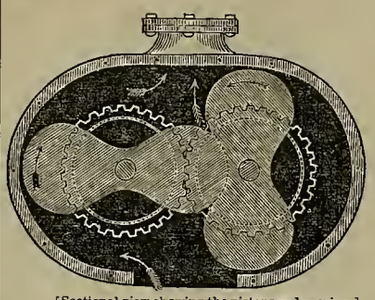
MANUFACTURED AT THE

GLOBE IRON WORKS,

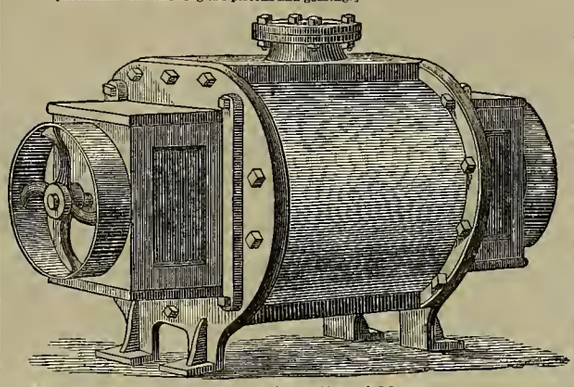
Stockton, Cal.



[Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'e Brase Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

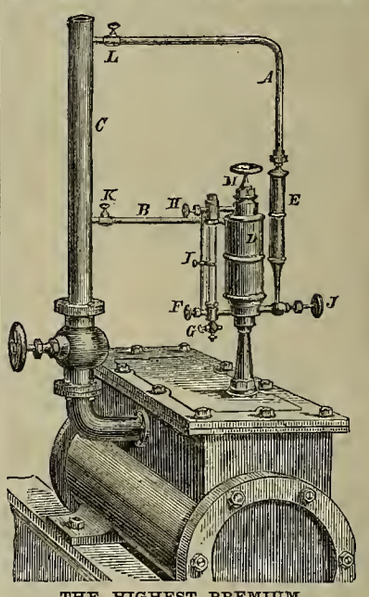
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glase tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. BROWN'S PATENT LAMP.

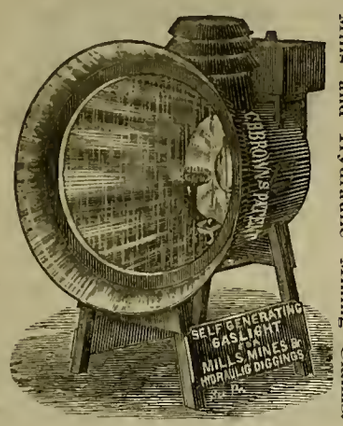
BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lampe, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lampe furnished at short notice.

For further particulars address

C. B. BROWN,
7v24-t Placerville, Cal.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottome, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco :

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS,
WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco :

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)
O. W. DICKIE, H. B. ANGEL, CHAS. R. STEIGER,
W. EPPELSHEIMER, MELLVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding.* Hooker's Hand Pump was the *only* Pump, of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY *Steam Pump that* EVER RECEIVED A SILVER MEDAL *at any Exhibition of the Mechanics' Institute ever held in San Francisco or California.*

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

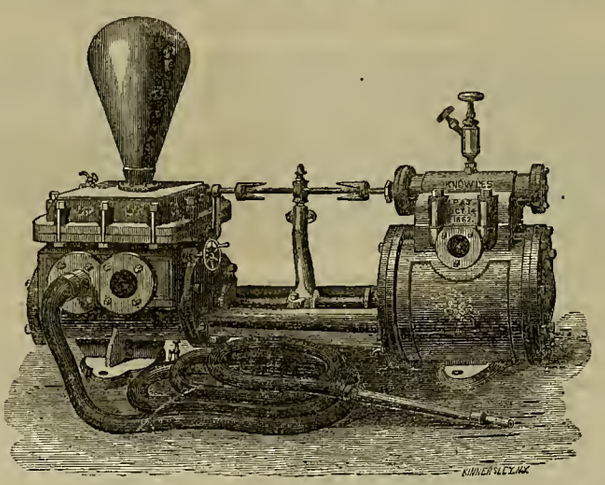
TREADWELL & CO.,
12v3-awbp Market street, corner of Fremont, SAN FRANCISCO.

KNOWLES' PATENT STEAM PUMP.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

24v23-tf JOHN TAYLOR & CO.

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be fonnd in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have douhtless heen saved to the miners of the Pacific Coast by reading this journal, each issne of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET, MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illnstrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issne a POPULAR VARIETY of highly interesting matter, nseful and instrnctive for all intelligent readers, systematically arranged in departments nnder headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoveries; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitahle at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

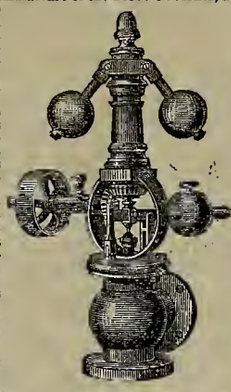
PURCHASERS please say advertised in SCIENTIFIC PRESS.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufactare of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accnrate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the severs1 parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickeat and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginis, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞WE WARRANT these Governors to give perfect regulation of speed under all circnmstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. *,*THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

THE FREAR STONE COMPANY
OF CALIFORNIA.
Office, 638 Market Street.

OFFICERS:
JAMES GAMBLE, President. | L. A. BOOTH, Treasurer.
EXECUTIVE COMMITTEE:
N. W. SPAULDING, GEORGE O. POTTER, N. P. PERINE.

This Company will contract to furnish or put up the heaviest, strongeat and most elaborate and elegant Fire-proof Stone Fronts, of any design, and every atyle of Plain and Ornamental Door and Window Caps, Keystones, Sills, Water Tables, Coping Ashlars, Plain and Ornamental Stone Work of every description. Fire-proof Buildings and Bank Vaults, Cemetery Work, Curbing Stones, Fountains, etc., all at prices far below native cut stone, and equal, in all respects, as to strength and durability.

Architects and Builders, before letting their contracts for Stone Work, are requested to call at the office of this Company, and examine certificates, specimens and photographs of buildings already constructed of Frear Stone in Chicago and other Eastern cities.

For further information apply to N. P. PERINE, 638 Market street. [19v24-3m

McDonell's Propeller.

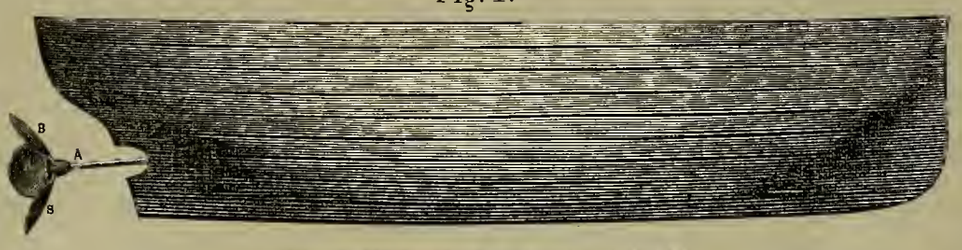
The reward of one hnndred thonsand dollars offered by the State of New York for the most feasible and practical plan for propelling canal boats has called fortb a large nnmber of improvements, within the last year, upon tbe varions plans and methods of propulsion.

Among the numberless devices heretofore snggested for accomplishing this purpose, the dncks-foot propeller has always been a favorite one, for the reason tbat it is supposed hy many to emhody all of the advantages of power and economy which it is possible to ohtain in a propeller.

This opinion originated from the fact that Natnre has supplied aqnatic fowls and animals with this class of propellers; hence the name ducks-foot propeller.

When a propeller is entirely snbmerged in water and performs its work hy a reciprocating motion, it is necessary to its snccessful operation, that the forward stroke should meet with as little resistance as possible, otherwise the effect of the stroke in one direction, would he conntereacted hy the opposite stroke, and the forces being equal the object to be propelled would remain stationary. To ohviate this the propeller is made so as to open and close antomatically hy the resistance which it encounters in heing moved back and forth in the water; thus, tbe direct stroke opens the buckets or wings so as to allow them to take full hold upon the water while the return or hack stroke closes the buckets so that they will slip through the water with little resistance.

Fig. 1.



MCDONELL'S PROPELLER WITH BUCKETS EXPANDED.

The McDonell propeller is shown in the accompanying engravings and the reader will readily perceive that it accomplishes the object in a very simple and thorough manner. The stem, *A*, in Fig. 1, extends through the stern of the boat passing through a suitable stuffing hox to render it watertight. At the outer end of the stem is formed or fixed a large flat head or end, *C*, the enlargement of the stem heing gradnally made. Just back of the head, *C*, three or more huckets, *B*, are hinged so as to open in an outward direction in the form of an inverted umhrella; when a direct hackward stroke is made the resistance of the water opens the buckets so that they take full hold upon the water; the reverso stroke closes tbe buckets so that they pass through the water with very little resistance. Fig. 1 shows the propeller at the time of the direct backward stroke, and Fig. 2 shows it when closed by the reverso action.

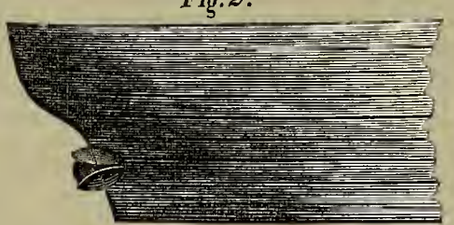
This one propeller at the stern would only be useful in driving tbe vessel forward, and in order to he enabled to back her it would be necessary to carry anotber one at the bow of the boat. This one tbe inventor proposes to entircly conceal by preparing a recess or cavity in the bow below the water line into which the propeller can be withdrawn and protected by a housing or covering when not in nse.

The inventor claims that he provides a much larger surface for taking hold of the water upon the direct stroke by employing the enlarged head, *C*, while it prevents the wings from entirely closing on the return stroke, so that they are ready to open instantly as soon as tbey meet the slightest resistance. Tbis gives the propeller greater power and consequently increases the speed of the vessel.

The inventor proposes to apply this propeller to canal hoats especislly, as he claims that it will produce no perceptihle agitation of the water, especially when it is given a downward slant while working. He also claims that it will require less power to accomplish equal results when compared with the ordinary propelling devices, and consequently a saving of fuel will be effected.

The inventor of this propeller is Mr. Thomas K. McDonell, of tbis city, who has secured United States letters patent covering his invention through the SCIENTIFIC PRESS Patent Agency. For further particulars address Wiester & Co., No. 17 New Montgomery street.

Fig. 2.



SHOWS THE BUCKETS CLOSED.

The New Mineral Land Law.

We give in another column the new mining law in the form in which it has finally passed hoth houses and received tbe signature of the President. This is a very important law and will be read and studied with much interest hy all engaged in active mining operations. The act of securing a patent to a mining claim will he greatly simplified and cheapened under the provisions of this hill. The check in land office fees is very direct and leaves no room for evasions or nndue exactions. The provision allowing testimony to be taken hefore County clerks as to the mineral character of land, recently secured by Mr. Sargent, hy especial instructions from the Land Office, have heen embodied in tbe new hill, and made still more liheral in its character.

A proviso with regard to agricultural land contignous to mining claims will he welcome to farmers. This proviso provides that when, in segregating mineral land, any legal suhdivision of a quantity of agricultnral land less than 40 acres remains, said fractional portion of agricultural land may be entered hy any duly qualified party for homestead or pre-emption purposes.

Quartz claims, hereafter located, either by one or more parties, eannot exceed 1,500 feet in length on the vein, or more than 300 feet on the surface npon each side, measnring from the middlo of the vein. Tbis restriction, however, will not prevent any number of single locations, nnder which patents may issue, to be subsequently consolidated.

In the location of placer claims, it is provided that when such claims cannot readily he made to conform to legal snbdivisions, the survey and plat may he made as in nnsurveyed lands.

The tnnnel seetion, giving the owners of tunnels the right of possession for all veins or lodes discovered witbin 300 feet of tbe face of the tunnel, and 750 feet on each side thereof, is rather hroad. This privilege was given to the Sutro tunnel as an exceptional case, and is now made universal.

Under former laws it has often occurred that there would be some drone wbo would refuse to do anything for the development of a mine, leaving all the risk to be assumed by his co-associates, wbile he came in and payed up only in case anytbing valuable was developed; in this bill a provision is inserted whereby such a person can be compelled to pay or forfeit his interest, after tbe reasonable time of one year and ninety days has elapsed. The bill, as a whole, may he considered a very acceptahle one; and will no doubt do much towards a more ready promotion of tbe mining interests of the country tban has been accomplished hy any recent National Legislation.

Corporate and Individual Mining.

The mining news from all over the Coast is extremely favorable, and work is being energetically pushed in every locality with good resnlts. It is a very significant fact that the mines which are held hy a few individuals who superintend them personally, and work them economically, without haste and in a systematic manner, are in a mnch more prosperous condition and tnrn out a larger amount of hullion proportionally than those which are owned by large corporations, who have expensive mills, superintendents at high salaries and turn ont their thousands of tons where the small mines tnrn out their tens. They do not make so much noise in the world nor do we hear of any "irregularities" of superintendents and others as among the heavy mines. The expenses are proportionally smaller, and tbe dividends larger. In fact, a company of four, six or eight men can make mining pay them handsome dividends where a large company will run in deht, althongh they may take out an ahundance of ore and get down in their ledge rapidly.

There are many reasons for this which will be evident to every mining man. Where a number of people have to pay tbe bills and the proportion of each is small, tbose who have charge of the expenditures easily fall into a convenient way of getting everytbing and anything that they tbink they want, and which they would otherwise do without. Moreover, each of these holders, when there are many, are not likely to examine the books. In small companies it is a very different thing, for each man being on tbe ground bas a personal supervision of affairs, and unless tbings are an absolute necessity they are not bought. They can canvass the question among themselves and decide upon tbe best means of overcoming any obstacle, and do so without delay. If expenditures are made tbey know where the money goes, and do not want a large commission paid them for dealing at any particular place. Tbe mine is worked slowly and systematically, and every lick of work is made to tell, while tbe ore that they get out with so much labor is carefully watcbed if crushed in a cnstom mill till the bar comes out and mill employés have no chance to levy tribute on it.

In visiting such mines as these we do not see a pile of pssable ore lying on the dumps because it will not pay a high figure, for if such ore comes out of tbe mine it has to pay its way, and if it will give anything over milling charges and hauling it is put througb. We know of plenty of mines where the owners live in a cabin near them, do a large proportion of tbe work themselves, and see tbat what they are not able to do is done properly, tbat are making fortunes for tbeir owners. It would astonish some of our "stock miners" to see the way such mines are managed, and tbeir hooks, if they kept any, would surprise them still more. The great pity is that our large mines, with their millions of capital, do not do as well proportionally as many small ventures wbich are the real life of mining industry on the coast.

Vein Phenomena.—Concluded.

[Written for the Press by A. J. Brown.]

White Pine Mineral System.

White Pine is but a small section of country, yet it furnishes a large number of distinct mineral-hearing formations. Overlying the granite on the west side of White Pine Mountain, not less than 3,000 feet of strata are exposed, up to and including the Treasure Hill dolomite, all of which is penetrated by mineral-bearing lodes and deposits. Within that space there are at least five distinct mineral zones, each furnishing a distinct and well marked type of mineral, and each accompanied by as well-marked a change in the lithological character of the formation.

The ore found in the dolomite of Treasure, Blne, Silver and Bullion Hills, is exceedingly simple in composition, being mainly a pnre chloride of silver, containing hut slight traces of either copper or lead. This is known as the free metal zone or belt, and in all cases is fonnd accompanying the dolomite. A few hundred feet west of this helt the ore gradually changes its charscter; compounds of copper, lead, and sometimes antimony, predominate. (The ore is mostly found in vertical fissures generally following the course of the outlying spurs of Treasure Hill, but sometimes crossing them as in the Imperial.) The limestone in this helt is less regularly stratified than in the free helt, is often granular, sometimes arenacious. Its color, when freshly fractured, is mostly light buff. The veins or deposits instead of coursing north and south are generally east and west vertical fissures, often showing themselves for a long distance on the surface. They are generally very irregular, varying in thickness from a line to several feet.

This coustitutes the second zone, and is situated along the western slope of Treasure Hill and the eastern slope of Bahylon Hill. The next zone is usually known as Carhonate Hill, and extends from Poyonix Cañon diagonally across White Pine Mountain in the neighborhood of the Jennie A. mine. Its whole length is ahout five miles. The formation resemhles the last, but is decidedly more areuacious. In the northern part considerable belts have heen chauged to quartzite. The ore found is principally carhonate of lead, (creusite) very poor in eilver. In the southern part of the helt,the ore rarely contains more than $15 per ton. In the northern part, however, it sometimes reaches $60 per ton. The deposits in and adjoining the quartzite contain considerahle copper and antimony and are quite rich in eilver.

Weet of this there is another intermediate zone situated in calcareous schist. Its minerals partake partly of the character of the last zone and partly of the next in order. Some parts of the veins carry red copper only, while in its immediate vicinity are found considerahle masses of argentiferous galena, cerneite and sulphide of antimouy, sometimes occurring separately, but more generally intimately associated. The veins are also intermediate between the deposits of Treasure Hill, and the true veins further west; they are fairly defined but there are no division lines separating the quartz from the wall rocks.

The next zone is in shales, and consists of one well-defined vein, cropping for over one mile iu length, with an average thickness of ahout 10 feet. The ore consisting of copper and iron pyrites (Chalcopyrite) is massive and compact throughout the whole vein. The next and last zone is situated a few hundred feet further west, iu the granite helt. There is only one known vein, which is doubtless a true fissnre. The ore found in that part wholly enclosed in granite is a compact sulphide of antimony, with ouly slight traces of any other mineral. At both the north and south end the vein passes into the stratified rocks, and the ore is valuable for its silver, while the south eud contains, in addition, traces of gold and copper.

There are several other subordinate bodiee of mineral found iu various parts of the district that are not important, excepting the French and some others in its vicinity. These deposits occur in the lower etratum of dolomite. The ore ie exoeedingly rich iu silver, geuerally ranging from $100 to $800 per ton; hut the depoeits are generally small and irregular. The ore is characterized by a strong admixture of copper, lead and antimony.

Will the Mines Continue in Depth?

As we have been dealing with the White Pine mineral system, it may not be inappropriate to refer here to a question of the utmost importance to her future prosperity, namely: May we expect a continuance of the deposits of free ore in depth. Of couree any opinion on the subject is at present hut mere speculation; hut were we better acquainted with the laws that govern the mineral world, we might answer the question with almost unerring certainty. As it is, we must judge by the knowledge in our possession. In examining the district we have found there are several thousand feet of mineral-bearing strata exposed, belonging to a lower geological horizon than the Treasure Hill dolomite. Thus proving that all the underlying strata are metalliferous. Therefore we have no reason for supposing that the strata covered hy the dolomite is less metalliferous than that from which it has heen denuded.

Furthermore, we find the minerals in the free belt arranged under certain conditions and in well-defined boundaries, showing nnmistakable ohedience to some given law. In some instances deposits were found near or on the surface, while others were discovered at varying depths up to 150 feet; but all the deep deposits are found on the east side of, and near the spar vein. Outside of that we look in vain for deep deposits, except in the base range. We have also found the "ore channel" along the spar continuous, sometimes in immense deposits, at others but a mere seam. In attaining depth we may look for the same order of arrangement, large deposits will gradually pinch to a mere seam, or perhaps give out altogether in parts of the channel, only to wedge out again, or to he succeeded by other deposits in depth. But as we find base ore in the underlying strata on both sides of the main helt, we may reasonably assume that the free ore will gradualy be replaced with baser compounds ae depth is attained and the underlying strata reached. In fact in mines where considerahle depth ie being attained, we notice a gradual change in the ore in that respect.

Schell Creek

Furnishee well-marked instances of changes in the country rock accompanied with corresponding changes in the accompanying minerals. The prevaling formation is dolomite lying upon a substance of porphyritic rock, and capped with a light deposit of calcareous shale alternating occasionally with considerahle masses of quartzite. The main helts or "ore channel" is situated along the plane of contact of the shale and dolomite, and apparently coincides with the latter in dip and strike. The minerals found in it are mainly silver glance and chloride, with very slight traces of copper (azurite and malachite). Some of the outlying deposits are encased wholly in dolomite, and the minerals are in all casee characterized hy an increased percentage of copper, silver copper glance, and compounds resnlting from its decomposi tion (azurite and malachite). South of Queen Springs hill, the dolomite is replaced hy a dark stratified limestone resembling shale, and the vein though continuing as strong as elsewhere is comparatively poorer in valuable minerals. At Ruby Hill, another change takes place in the formation. A species of greenstone is found in contact with the vein, and the ore though very rich in eilver, is characterized by a etrong admixture of antimony. Hence the name of the locality.

A Remarkable Ledge.

But, probably one of the most interesting ledges in Eastern Nevada, is situated in the Bunker Hill mining district, thirty miles south of Austin, Lander connty. One very prominent vein, evidently a true fissure, courses through the district, generally north and south. In thickness it variee from ten to sixty feet. Quite extensive developments were made in former years, and something like 2,000 tons of ore have been worked by the different companiee owning locations on the lode. The ore is abundant and of good average grade, unnsually refractory. The vein can be traced through several dietinct formations for a distance of two miles, and every change in the formation develops a different type of minerals. Thus commencing at the south end we find the enclosing rocks to be graphitic elate, and the vein ie entirely nonmetalliferous. The next formation, for about 1,000 feet, is diorite and argelaceoue ehale—the former the hanging, the latter the foot wall. The miuerals found aro argentiferous galena and anrif-erous iron pyrites. Native sulphur is occasionally fonnd in cavities or druees in the quartz. The next location is in argillaceous shale; gold is the predominating metal. The next 1,000 feet passes between a diorite hanging and a shale foot wall; minerals the same as before described for the same formation.

The somewhat noted Victoria mine occnpies the next 1,200 feet. The vein is here 30 feet thick encased in argillaceous slate, yields gold, silver, copper, lead and iron pyrites. The ledge next passes through a thick bed of limestone, and a remarkable change takes place not only in the minerals, but in the character of the ledge itself. Its vein character is wholly lost—limestone replaces the qnartz, and the ore occnrs in bunches and deposits. Moreover there is a decided change in the minerals. The gold and iron pyrites are entirely wanting, and the silver is found in combination with antimony, lead, copper, sulphur and arsenic. (Silver Fahlerz.) A few hundred feet further on, the ledge passes out of the limestone into slate, and again assumes its vein character and with it its former combination of minerals, viz., gold, silver, copper, lead and iron pyrites.

This part of the vein appears to furnish an instance where the enclosing rocks have not only had an influence on the metallic contents, but have determined the character of the vein, also, by changing a fissure in slate etc., to a system of deposits in limestone.

The San Diego Mines.

Ens. Press:—The fine rains that we have had in this region, recently, have revived the whole face of the country, and with it the hopes of the people generally, and particularly the farmers, as the crops never have looked half so well for three years past. Our minee are also improving steadily, as the work of development slowly progresses. The

Golden Chariot Co.

Of Banner District, have a shaft down 100 feet and the ore is hetter than they ever had hefore, and good judges say it will go $200 per ton. They have out now, more than 100 tone. The Madden Company had twenty-five tons of ore worked from their ledge, ten days ago, which returned $110 per ton. The

Ready Relief Co.

(Belonging to Bailey Broe.) cleaned up last week from eight tons of ore, worked in their little wooden mill, three stamps, $140 per ton. They now intend to get an iron battery, to run by water power, when they will he hetter situated to make money and work economically any mine in the country. The mine ie opened on the face of the hill in three or four different places, ehowing gold everywhere. They have it prospected about 800 feet on the face of the hill, from the opening at the hottom, and the ore is dumped from the cart, at the mill. This mine is the eouth end of the

Rsdmann Ledge

Owned by McMechan & Whitney. Work has heen suspended on the Redmann mine for the present, on account of water, for with the present machinery they cannot keep it clear. The mill is now running on 25 tone of ore from the Pacific, a ledge lately discovered by Mesers Gilbert & Lewis. The ore ie varionely estimated as worth from $60 to $100 per ton.

Other Mines.

Good rock is heing extracted from the Chapparal ledge, The "Antelope" mill etarted up on rock from the ledge of that company, estimated to he worth $100 per ton. The "Big Blue" had a crushing of ore from their ledge last week of 25 tone without aesorting, which paid in Reynolds & Co.'s mill $42 per ton. The Bueh hoye had a clean up at eame mill of 30 tons of ore which paid $47. De Frees & Moore's mill is running constantly on rock from the

Owen's Mine,

Which rock ie paying fiuely. A clean up of 100 tons made two weeks ago returned $50 per ton. The present run is taken from the 200 ft. level (the depth of the shaft,) and much hetter rock than ever was taken from the mine before. While I am writing I am told they have finished the run of 150 tons and cleaned np to-day $68 per ton, the heet return ever made from the Owen's Ledge. Since Wm. Wilson has started his sawmills and is furnishing lumber, new houees are going np, hotele enlarging, new ones heing built and merchante receiving larger stocks of goods and selling more than ever before.

L. B. M

Julian City, April 23, 1872.

Large Sales.—Dnring the last three month sales of Plumas county mining property—quartz and gravel—have been made to outside capitalists to the amount of $1,235,000. This epeake for itself, and shows that a portion of the rich deposits of our mountains, so long neglected, are about to he worked. We have always contended that our county offered a more extensive field for large paying mining operations than almost any other in the State, and now that capital is taking its place in our midst, we expect to see our predictions verified.—*Quincy National.*

The Great Bonanza.

The extensive and immensely rich body of ore developed and still developing in the Crown Point and Belcher mines, is simply an exaggerated specimen of the ore deposits lying within the limits of the great Comstock lode. The lode itself extends definitely to the distance of ahout three miles in a northerly and southerly direction, with a dip or inclination of forty-five degrees east as it descends into the bowels of the earth. Its width between the walls varies greatly, heing from fifty to three hundred feet, or thereahouts, the north end being apparently the narrowest, while at the south its real width seems more and more indefinite as fnrther developed. The general character of the vein matter between the walls is porphyry, quartz, clay and similar material, considerably mixed, with occasionally veins or pockets of water. The ore bodies are the exception to the general character of the ledge, and do not seem to he in regular chimneys or streaks, but, in independent deposits, occuring simply where ever they are found—to nse a common expression of the most experienced superintendents and mining men.

These ore bodies or bonanzas are of all sizes, and in two instances show signs of regularity or continuous connection from the surface down to the greatest depths yet attsinod. One instance is that of the Gould & Curry, appearing at the surface and following down in an almost uninterrupted chain sonthward—and eastward with the dip of the ledge—through the Savage and Hale & Norcross. and evidently into the unexplored lowest depths of the Chollar-Potosi. The other is that of the Belcher, extending from the surface or thereahouts northward down to the lowest depths of the Crown Point. Bonanzas of all sizes have been found and worked ont in various portions of the ledge, near the surface, as in the Ophir, Mexican, Chollar, the mines of Gold Hill proper, the Yellow Jackct, Overman, etc. An important specimen was the rich Belvidere body in the Chollar-Potoei, extending from at or near the eurface to about 200 feet below. It was nearly 200 feet long, and 60 or 70 feet wide, egg-shaped, and was nearly all worked out last year, yielding some millions of dollars. In the Overman several considerably smaller bunches of rich ore were worked out in times past; and, as we have stated, the prospecting exploratione in the varions mines along the great lode are liable to dovelop new hodies of greater or lesser importance at any time and where least expected.

The great chief bonanza of all, however, thus far, is that encountered in the lowest levels of the Crown Point and Belcher. Already it is known to be four hundred feet in depth, a hnndred feet or more in width, six or eight hundred feet long and its limits in any direction are far from being definitely known. Widening as it descends, it is literally one grand mountain-like mass of rich silver and gold ore, to which all the other honanzas or bunches of ore heretofore found are mere stray nodules. It gains to the north and sonth as depth ie attained, and bids fair to not only include the entire length of the Crown Point and Belcher claims, but also to extend into the Segregated Belcher and other mines south. Thue far it has exceeded the ntmost limits of the wildest and moet sanguine imagination, and no man, even now, may set a definite limit to its boundaries.—*Gold Hill News.*

Sold.—Mr. Reed, of the Black Bear Mining Company, arrived here from San Francisco on Tuesday last. From him we learn that the Black Bear mine is sold, and that the delivery of the property will be made as eoon as the transfer of the etock is completed. He thinks that one of the firet thinge which the new company will undertake after getting posession, will be the construction of a wagon road from Scott Valley to the mine. They purpose to enlarge greatly the capacity of the mill, and to do this properly a wagon road is almost indispensable. Mr. Reed left on Wednesday morning for Salmon.—*Union, Yreka 4th.*

Recent experiments in England have shown a net profit of $105 per acre upon land that was systematically irrigated; whereas, upon eimilar land of the same tract, when the irrigation was omitted, the net profit was only $45 per acre The "Great American Desert," that once occupied so large a space on the maps of Western Territories, will nearly all be made productive hy irrigation.

MECHANICAL PROGRESS.

Russia Sheet Iron.

Mr. Rodgers of Apollo, Pa.., has devised the following method of producing what is known as Russia sheet-iron. It is claimed that the process accomplishes more than any other ever devised:—

The iron, being of proper gauge, is covered on the surface of each sheet with particles of charcoal of about the size of a grain of wheat, taking care to have these particles evenly spread over the entire sheet, completely covering the surfaces with them. There is then laid another sheet of iron upon this first sheet, and, in like manner, its upper surface covered with like particles of charcoal. The operator thus continues to place sheet upon sheet, covering the upper surface of each until is formed a pack of about forty sheets. The edges are then clamped in the usual manner for forming packs of sheet iron, and the pack then placed in the heating furnace, with the under sheet of the pack resting upon a bottom plate. There is then placed around the edges of the pack wood which has been thoroughly soaked and saturated with water, forming a protecting wall of wood. The mouth of the furnace is then closed so as to prevent the admission of air into it. The fire is then started in the fire-chamber, using wood as the fuel. After the fire has become completely ignited, the damper is lowered so as to retain the heat, smoke, and gases of the fire in the furnace. After the iron has been subjected to the action of the heat, smoke, and gases of the furnace until each sheet in the pack has become red, which will require about two hours, the pack is removed from the furnace and subjected to the action of a "steam hammer," or other concussive or impinging force, for the purpose of working the oxyd which has been formed on the surfaces of the sheets into the body of each sheet. The pack is then unpacked and repacked in the same manner as in forming the first pack, taking care to bring the center sheets of the pack to the outside of the pack, and the outside sheets to the inside, thus interchanging consecutively the center sheets. The pack is again subjected to heat in the heating furnace in the same manner as in the first pack. It is then removed from the furnace, and again subjected to a hammering or other force, as in the first instance. This packing, heating and hammering process is repeated four or five times, which will, as a general rule, sufficiently work into the iron the oxyd formed on the surfaces of the sheets at each heating of the pack, and give it the necessary finish and polish. The sheets are then trimmed by the shearing process, and passed through the length of the oven will be sufficient to anneal and properly color them. The sheets are now finished and are in a merchantable condition.

The Hammer vs. the Rolls.

Quite a discussion is going on between some gentlemen connected with the American Institute of Mining Engineers, in regard to the relative excellence of hammered and rolled ingots for steel rails. As rail-blooms must be reheated before the rail can be completed, the manner of forming the best bloom becomes the question of importance. One party claims that the hammer will expel more cinder and other impurities which may be in the puddle-ball or ingot, and make a more dense and tough steel, especially because the mass can be upended and compacted by heavy blows upon all sides, whereas the rolls, with less power, simply stretch the bloom and form it. The other party contends that when a heavy squeezer is used a better effect is had upon the puddle-ball or pile than can be induced by the hammer, and that the roll then completes the work more rapidly and better, because, in stretching the mass, it causes the metal to be pressed forward and revolve upon itself as well as to be made dense, and hence no better result could be obtained. So far as the squeezer is concerned it cannot apply to the ingot, as it is not so used, and the probabilities are that the roll has not been more generally used because there have been but few large enough. Since the Bessemer process has furnished means for producing large ingots the use of the hammer is no longer a necessity, although it is preferred in some cases. With all that has been elicited upon the subject, it seems that the preference given to the hammer arises mainly from the fact that tool-steel has up to this time been made by the use of it.

A torpedo boat is to be built at Boston, 170 feet long, 35 feet wide and 15 feet deep, drawing about 12 feet of water. It will be of 350 tons burden, with two propelling engines and two propeller screws. The plow is to be made sharp and will carry a steel ram six feet under water. Above the ram there will be aperture, through which will pass a long composition spar carrying a torpedo at the end. The sides will be plated with six-inch iron, and the deck with one-inch steel armor. The estimated cost is about $300,000, to which may be added about 50 per cent. for extras and items not counted in the estimates.

A new canal has been projected for connecting the Rhine and the Weser. It is to be about eight and a half feet deep, forty-four feet wide, and over one hundred miles in length. The cost is estimated at about $7,500,000.

Glass-Lined Water Pipe.

A company has been organized in New York, for the purpose of lining pipe and tubing of iron, or any other firm metal with tubes of glass. The glass tubes are made a fraction of an inch smaller in diameter than the metal tubes, and the space between is filled with plaster-of-Paris. The plaster is mixed to the consistency of cream and poured in, after which it soon becomes a firm lining, or wall between the glass and the iron or other metals, and being a non-conductor of heat and cold is not liable to freeze or be otherwise injuriously effected by the changes in the temperature of its surroundings.

That a pipe which will convey pure water to our stomachs and systems, is a most desirable thing, there can be no doubt; and that glass will do this is certain; while the fact that lead will not, is equally sure; and yet one must remember that iron will bend, and glass tubing is brittle and will break on the least deviation from the straight line, and when plaster and particles of glass and oxide of iron come in contact with each other, what the result will be, remains to be seen, when such breakages occur, as they must in the course of handling the tubes as roughly as baggage smashers are in the habit of handling.

There is no better field for the exercise of ingenuity than the one left open by this pipe business. The parties who propose the glass lining, have selected an admirable substance for the purpose in every respect but the most important one. It is not flexible, and consequently cannot be depended upon, and in fact any practical mind would condemn it at once except for use in cases where it would be absolutely free from liability to accident or external influences.

The plaster filling, or insulation, supplies, in principle, the best of protection to the glass tube and its contents against atmospheric influences, but in practice itis subject to the same objections which are patent to the glass, in the want of flexibility, except in cases where it is not subject to disturbance.

The material which is coming to the front for the lining of pipes is rubber, vulcanized to a degree which gives it body without destroying its flexibility. But a process has not yet been discovered by which this material can be well applied to the interior of tubing.—*American Manufacturer.*

Steam Canal Towage.—The *Manufacturer and Builder* calls attention to the fact that nearly all, if not quite all, the experimentors upon the steam canal towage problem, have overlooked an important fact developed years ago on the western rivers, that towing can be done with far less power by attaching the freighted barges or flats *ahead* of the towboat than to the rear of it. In the case of river work the fact was developed by reason of the damage contributed to craft, low down in the water, by the swell made by the tow-boat. When the freighted boats are pushed ahead of the tow, far less resistence is offered by the water than when they have to be drawn through a swell.

Boiler Incrustation.—This is a subject as yet very imperfectly understood, but about which there is much empiricism. The *Railroad Gazette*, after discussing the matter at considerable length in several of its late issues, "gives it up" as follows: "Of incrustations, we in common with some hundreds of thousands of other people want information. We confess we know very little about the subject, and certainly are not aware of any sovereign remedy for the evil. We are quite sure, however, that a great deal of matter gets into boilers which should not, and does great injury there; and the man who can tell how to exclude foreign substances may be sure of having very attentive listeners."

Naval Ships of War.—The English propose building a ship of war with armor plating *on the bottom*, leaving the top sides unprotected, and, to compensate for this disposition of weight, the coals, stores and cables are to be above the water-line. The vessel is to be armed with submarine rocket tubes for the projection of rockets possessing the inherent property of preserving a given depth of immersion, and which will explode a charge of gun-powder or other explosive on coming into contact with any solid substance, such as a ship. Authority for the above statement is the *Mech. Mag.*

Melting Steel.—By experiments recently made with a small furnace of Sweet's patent make, it was found that steel could be melted in two hours, with raw semi-bituminous coal-mine slack, or the fine coal as it comes from the mine, putting the steel into the pots cold, and allowing one pound of coal for one of steel. Encouraged by these and other tests, the Sweet Manufacturing Company, of Syracuse, are at work putting in a 16-pot furnace, and will begin the business of melting steel about April 1st.—*American Manufacturer.*

A New Safety Signal invented by Mr. George B. Cumminge, is to be tried on the Boston and Maine Railroad. A dial, with figures from one to ten, nine inches in length, is set in motion by a rod being struck by a passing engine, and continues in motion ten minutes, and showing a red signal to an approaching train. The illuminated dial can be seen a great distance, and when wound up will run for ninety trains. It is designed for curves, tunnels and other dangerous places.

SCIENTIFIC PROGRESS.

The Marvels of Nature.

In attempting to write of the marvels of nature in this age of scientific development, one scarcely knows at what point, or with what element, to commence; for within the last half century, every element, as well as everything we use—our food, clothing, dwellings, modes of travel, and weapons of war as well as implements of peace, have all come within the reach of science, much to our advantage. The application of chemistry to food, agriculture, and sanitary reforms, has lengthened the life of the present generation at least five years longer than its predecessor, while the application of steam to manufactures, land and water travel, and electricity to commercial purposes, enables us of this age to conduct as much business in one year as our grandfathers could in ten. It is an undeniable truth that no race of men ever existed who have seen so many of the marvels of science, or who knew so much of nature, as this generation. Yet, withal, the very element by which all nature is seen, the very source of beauty—Light—is as great a mystery to us as it was when "God said let there be light, and there was light."

None of the elements by which we are surrounded appear to the uninstructed eye so simple as light. It is less material than air, it is infinitely less so than water, which serves our purposes as ice or vapor. Science has not yet been able to discover what light is. We don't know what light is any more than we know what the electric fluid consists of, if the subtle agent that conveys our messages across the continent really is a fluid.

Electricity gives us a pleasing tittilation, or a smart shock, or strikes us dead; coats the baser metals with glittering gold or silver; generates a motive power to work ponderous machinery; make a light of intense brilliancy, and performs a thousand services for us without our knowing exactly what it is. Light is infinitely more necessary to our comfort and happiness, serves even more important purposes; but we know no more of the nature of the one than we do of the other.

Without knowing thoroughly its nature, science has demonstrated that the simplest ray of light consists of many colored parts. Newton first split the solar rays into seven distinctly colored parts by means of the prism—although the rainbow has done the same thing since the dawn of the world's creation. Since the discovery made by Newton, botanists, chemists and photographers have derived great benefits by a knowledge of the various properties of the several rays of light. The generative ray, the heat ray, and the actinic ray, differ greatly in their effects in nature's great laboratory. Late investigations have proven that the actinic ray is more powerful in the new world than in the old. This will account for the superiority of American sun-pictures, particularly of those taken on this coast.

The boundaries of our knowledge of light, though quite circumscribed comparatively, have been much enlarged during the last twenty years by the discovery of its polarization, which, in a manner, enables us to analyze it—to concentrate its peculiar parts for our use. We know of no greater marvel than the examination of objects with polarized light, under the microscope. It renders visible minute details of structure in the most beautiful colors, and enables the student of nature to ascertain the difference of density or elasticity of substances, such as no other means could detect. It not only exposes frauds and adulterations in substances we purchase, but by its peculiar power shows us the causes of disease and death existing in what, by the uninitiated, are considered elements of health.

This is a very general misconception as to the power or principle to which certain phenomena, the result of exposure to sunshine, are to be referred. In general, *light* is regarded as the principle in such action; whereas, most frequently it has nothing whatever to do with it. The solar rays, which are commonly spoken of as light, contain, in addition to their luminous power, calorific and chemical powers, and there is good reason to believe, electric power also. All these powers are employed in the arts separately. The beautiful art of photography owes its origin to the discovery of the chemical or actinic property in the sun's rays.

One of the most remarkable proofs of the chemical nature of the sun rays is found in the action of chlorine. This element, which has worked quite a revolution in the process for bleaching linen and cotton fabrics, because of its power of removing vegetable colors, is quite powerless when out of the reach of the assistance of the sun. Flowers, cotton and linens may be kept for years in vessels containing chlorine, if kept in the dark, without losing their color. The same results follow with oxygen, sulphurous acid, carbonic acid, hydrogen and other bleaching agents, which are all powerless in the dark, while sunlight alone does not affect the colors of those substances. Another singular fact in the same connection is, that colored solutions made from mineral or vegetable substances, are much brighter when made in bright sunshine, than when made during the evening or night.—*The Miner.*

A Valuable Coal Bed.—Report says that the coal bed, near Evaneton, Utah, is from 22 to 32 feet in thickness, and constitutes one of the largest and best coal mines in the West.

The Reproduction of Eels.—Among the prizes offered by the Belgium Academy of Science for the year 1873-74 we find one mentioned for a dissertation on the reproduction of eels. It may seem somewhat singular in this era of scientific research that we are not yet acquainted with the true method in which the spawning and reproduction of the eel is accomplished. The present hypothesis is that the young are hatched in salt water, and make their way up the rivers as far as they can go for the purpose of spending their period of immaturity, returning, after the expiration of a year or more, to the salt water to lay their eggs, and never again quitting the sea. This movement is the reverse of that which occurs in the case of the salmon and shad, these ascending to the fresh water to deposit their spawn and then going down to the sea. The assertion is not unfrequently made that eels are viviparous, and that the young can be seen at times in the oviducts of the parent. This is a misapprehension, due to the fact that this species is frequently very much infested with intestinal worms like *ascarides*, which occur in great number, and appear on dissection like embryonic fish. We can only hope that the prize offered by the Belgian Academy may be successful in securing a memoir that shall solve what may now truly be called the "oppobrium" of modern naturalists.

The Phosphate Sewage Process of Prof. D. Forbes and Dr. A. P. Price, of England, has been said to be very successful. The plan consists essentially in precipitating all the solid matter of the sewage by means of a natural phosphate of alumina found in very large quantities in the West Indies. To deodorize foul sewage, the phosphate is powdered and then treated with sulphuric or hydrochloric acid, by which means it is decomposed and rendered soluble. The solution thus obtained—which is said to fully arrest putrefaction and render the most fetid matter free from all offensive odor—is mixed and agitated with the sewage in tanks. Then on allowing the sewage to remain quiet, all its solid matter previously held in solution is precipitated, and the effluent water is pure enough for discharge into streams. But to render this still surer, a still greater clarification can be effected by adding, during the operation, a little milk of lime which precipitates the phosphates in solution. When the effluent water is used for irrigation, the milk of lime is not added. It is claimed that this water is more valuable, bulk for bulk, for irrigation than the raw sewage, because, instead of losing any of its mineral fertilizing matters, it has become slightly richer in saline ammonia.

The Geological Survey of Montana.—F. V. Hayden, who is conducting the Geological Survey of Montana and adjacent Territories, under authority of the Secretary of the Interior, has just issued his fifth annual report, which is pronounced by the *Journal of Science*, as one of unusual interest. It gives a full account of his explorations of the Yellow Stone Geyser region; a digest of which is concluded in our issue of this week. Dr. Hayden's special report is followed by a preliminary report on the minerals, thermal waters, etc., by Dr. A. C. Peale, who finds that the silicious deposit of the springs, (geyserite, a variety of opal) afforded in one analysis, silica 83.83, water 11.02, chloride of magnesium 4.00, loss 98.85, specific gravity 1.8, hardness 5.

Man Work.—A man's total outward work, his whole effect upon the world in twenty-four hours, has been reckoned about 350 foot-tons. That may be taken as a good "hard day's work." During the same time the heart has been working at the rate of 120 foot-tons. That is to say, if all the pulses of a day and night could be concentrated and welded into one great throb, that throb would be enough to throw a ton of iron 120 feet into the air; and yet the heart is never weary.—*Dr. Van der Wyde.*

Rio Janeiro, and various places on the high plateaus of the interior of Brazil, indicates that the light is derived from the sun by reflection, and the absence of polarization, which is quite differently, though not positively, ascertained, tends to show that the matter reflecting the solar rays is not gaseous, but made up of solid particles, scattering the light irregularly.

The results are somewhat in conflict with some of the reported observations of Mr. A. C. Ranyard, made at an earlier date.

Ozone-Genesis.—Dr. Pincus states that if perfectly pure dried hydrogen gas is caused to burn, in a very small flame, from a jet ending in a very fine point, the smell of ozone is very distinctively perceived, and it becomes more conspicuous if a dry and clean beaker-glass is held over the flame. When, by the aid of a properly contrived apparatus, the combustion takes place in pure oxygen, the same phenomenon is observed.—*Chem. News.*

The agricultural resources of the Territories, is reported upon by Prof. Cyrus Thomas. Reports are also given on fossils, geology, paleontology, etc., by different members of the Survey. The volume contains a very large contribution to our knowledge of the physical features and condition, geology, natural history, etc., of a large part of the Rocky Mountain region.

Dana's Mineralogy.—Appendix to the last edition of *Dana's Mineralogy* has just been issued. It contains 24 pages, 8 vo., and has been prepared by Prof. G. J. Brash. It contains descriptions of 87 minerals by him during the past four years.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE COUNTY.

Bullion.—Monitor *Miner*, May 4th: This morning the Tarshish mill sent away 4 bars weighing 2,912 ounces, and there are 2 more bricks at the mill.

Concentration hy the use of blankets, is to be tried at the Tarshish mill.

Nice Ore in good body was struck yeeterday in the Monitor lower tunnel.

AMADOR COUNTY.

Markiee.—Jackson *Ledger*, May 11th: This mine, after a run of 16 day's with 12 stamps cleaned up a little over $13 000. This gives to the amount of rock milled a value of from $75 to $100 per ton.

BUTTE COUNTY.

Spring Valley.—Oroville *Record*, May 11th: On Monday Lathrop & Harris came down with hars of bullion valued at $40,-000, the result of cleaning np the head branches of their flume, after less than a month's ran.

CALAVERAS COUNTY.

Wolverine.—Calaveras *Chronicle*, May 11th: The 200 ft. level has struck the so-called "south chimney" at a point 160 ft. from the main shaft. The level has penetrated the chimney about 10 ft. In the end of the drift the lead is 2 ft. wide. It is a heautiful ribbon quartz, containing lead and iron sulphurets, and showing gold to the naked eye. This level in passing through the north chimney developed an almost continuous hody of pay quartz for a length of 90 ft. In the bottom of the sump, 16 ft. helow the level, the lead of qnartz is wide and very rich.

Jenny Lind.—The water ditch has recently changed hands and the new Co. intead enlarging the ditch and carrying it at such an elevation that all the gold bearing hill around Jenny Lind can be worked advantageously.

Hudson.—Calaveras *Citizen*, May 11: We were shown this week the result of an assay of some rock from this claim, which reaches the working rate of $19.43 per ton. At 145 ft. the vein widens; in fact there is another vein with a partition wall between. Work will have to be suspended in a short time in order to drain the mine.

Whisky Hill.—The Whisky T. Co. turns out 60 ibs. every clean up day.

Collins & Co., last week washed up $5,000

The Bnnker Hill Hydraulic Co. have their flume re-set with a greater fall and are again husily at work.

We hear that some new diggings will he opened up to the west of town during the coming week.

The tunnel through the hill at South Gulch, between Milton and Whisky hill, is nearly completed.

G. A. Conrad has sold his ditch to a Co. of capitalists from the Northern mines.

On this side of the river Mr. Conrad has gono to work upon his hydraulic claim; also Galaga & Co.

Valleoito.—The Bonny placer claim has commenced work, and employs ahout 15 men.

Bascigaloupi & Co., are taking ont conciderahle gold.

The claims of Miller & Co., Largo & Co., and Sanguinetti & Co., are all doing well.

NEVADA COUNTY.

Erie.—Nevada *Transcript*, May 11: The Erie quartz mine at Eureka, is paying large dividends. The Co. give employment to a large nnmber of men, and the mine looks better than ever. They clean up once a month, hut the exact amount is not known.

French Corral.—Recently some excellent quartz prospects bave heen obtained, and a ledge has been opened which indicates great richness. In running the tunnel into the ledge, owned by Eddy & Co., rock was obtained which yielded $25 or $30 per ton. The Co. has 200 tons of rock out at the mill.

Moore's Flat.—The Co's. are all at work doing first rate. In the Eagle Co's claims, recently, they have obtained some excellent specimens of coarse gold. A few days ago abont 3 ozs. was creviced out in a few minutes. The specimens were very large and the gold of fine quality; 2 of them weighed 1¾ ozs.

Grass Valley.—Cor. National *Gazette*, May 4: At the Idaho, quartz looks as well as it ever did. Work is heing prosecuted vigorously at the new mill.

PLUMAS COUNTY.

New Ditch.—Quincy *National*, May 4: A Co. has recently commenced work on a large ditch and flume, to take water from Indian Creek, above Shoo Fly, and will work some claims near the river, above Soda Bar.

SAN DIEGO COUNTY.

Bullion.—San Diego *Bulletin*, April 27: W. F. & Co. shipped by the Senator, $10,-450 from the Julian mines.

The Mines.—The Owen mill crushed, last week, 22½ tons of rock from the Washington, which cleaned up $780. The mill is now crushing rock from the Bush Boys mine, which yields $100 per ton.

The Antelope mill is at work. The first 3 tons cleaned np $480.

The Golden Chariot is heing vigorously worked. So far 160 tons have heen crushed, yielding $17,000.

The Stonewall mill is ruuning night and day on the rock from the upper level. It is decomposed quartz and works easily, yields from $20 to $25 per ton.

The owners of the Big Blue are taking out rock that pays from $15 to $150 per ton.

Pierce and Reynolds' mill is at work on rock from the Hayden.

San Diego *Union*, April 27: The proprietors of the Wilson Mill are re-setting their hattery. The Stonewall Co. intend adding 5 more stamps to their mill. The ore is improving. Work in the mines goes on with continued vigor and the Helvetia, Hayden, Excelsior, Eagle, Big Blue, Washington and many others are being worked quite extensively. The Helvetia is now again under its old management. De Frees & Co.'e mill and mine employs 25 men at present. The Count is actively developing the Excelsior. News from the mines are very favorable.

SIERRA COUNTY.

Progressing.—Downieville *Messenger*, May 4: The work of getting water to ruu a mill for crushing Good Hope ore is progressing rapidly. The mill will he ready to run hy the first of July.

TUOLUMNE COUNTY.

Rich Quartz Thread.—Sonora *Independent*, May 11: Some time since, as J. T. Ryan was prospecting near Sugar Pine, he came across a thread of rose quartz, richly studded with gold, which be began sinking upon. The thread is now about 3 inches wide, and is increasing in richness as he sinks.

Strike.—Selby Teeters, M. B. Harriman and Ben. Crosby, have struck a lode of quartz on Chili Gulch, which is exceedingly rich. The piece shown ns, about half a pound, was literally covered with fine gold.

Quartz and Talc.—Hon. W. G. Long, in his ledge on Woods' Creek, has at a depth of 20 ft. struck rock which will mill $150 per ton. The talc pays from 50 cents to over $1 per pan. On Monday 3 pans of talc, 60 ibs., yielded $3.20.

Patterson Quartz Mine.—This mine is near Tuttletown. The hoisting works are nearly completed, and the Co. will commence taking out rock next week. The vein will average from 4 to 30 ft., and from all indications will pay upward of $12 per ton. Five stamps of their 10-stamp mill are at work.

Nevada.

ELKO COUNTY.

Diamond Dist.—Elko *Independent*, May 11th: B. F. Bivins has favored us with some fine specimens of ore from the Champion. The ore is carbonate, averaging in silver $150 per ton, and about 84 per cent. lead. At 100 ft. the ledge varies from 3 to 5 ft. in width. The Co. have on the dump 300 tons.

ELY DISTRICT.

Local Record—Ely *Record*, May 5th: Bullion.—The shipments for the past week, aggregate $124,332,70.

Von Moltke & Estick.—Situated immediately next to the Ivanhoe. Main shaft down 103 ft., but not working in at present. A cousolidation has been formed between the Moltke and Estick, aud work commenced in the Estick, on a new shaft ahout fifty ft. below the original Moltke shaft. Although but 12 or 15 ft. has been attained, the ledge shows well.

Newton Booth.—Main shaft down 183 ft. Drift No. 1 in 130 ft., through ledge matter all the way. Drift No. 2 cuts the ledge at 60 ft. from the shaft, and a winze has been eunk on the same 66 ft. Assays from the ledge show from $3 to $12 in mineral. Drift No. 3 cuts a 6 ft. ledge 34 ft. from the shaft. The shaft is being cut out and squared for the reception of timhers.

Washington & Creole.—Still working on the raising from the 342 ft. level west, to connect with the winze from No. 3 of the Meadow Valley for air. The ore body spoken of in our last, on the 334 ft. level continues to widen, and has opened out to 2½ ft. After connection for air is made stoping will commence and the ore hrought on top with dispatch.

Spring Mound.—The shaft has reached 150 ft. Work has been suspended to cut and timher it.

Alpine West Ex. and Madassa Cons.—The shaft is dowu 95 ft. and still sinking. Ledge matter is coming in on the hottom, and shows a trace of mineral throughout.

Two Brothers.—The incline is down 130 ft. and still sinking. The ledge shows in shaft, and carries some very good mineral throughout.

Chapman.—The shaft is down ahout 270 ft. and they are raising ahout 8 tons of ore per day.

Newark.—Sinking, with 3 shifts of men. Ledge matter ie coming in, hut as yet is rather broken. Hoisting works will be erected over the shaft at once.

Vanderbilt.—This claim is immediately east of the Alps. Shaft is down 110 ft., and sinking through quartz on ledge. They will sink 40 ft. more and then drift.

Ivanhoe.—The old shaft is down 120 ft. and a new shaft is heing sunk about 60 ft. from the old one. A drift is being run on ore to connect the two shafts, from the 60 ft. station. The ledge shows well in the hottom of the new shaft, which is still sinking, hut the rock is very hard.

Setting Sun.—This mine lays east of the Silver Peak. The shaft is down 40 ft., and the ledge shows good ore, which averages an assay of $200. The ledge matter is about 4 ft. in width, and carries about 2½ ft. of mineral.

Norfolk.—Situate abont 2 miles from Pioche, on a ledge supposed to be a continuation of the main ledge of this camp. The shaft is down 100 ft., and a new contract has heen let for sinking it 100 ft. deeper.

San Jose Con.—It consists of 2 locations, viz.: the San José and the Justice, each containing 1,200 ft. and is about a mile and a quarter east of the Pioche. The Justice only is heing worked. The shaft has heen sunk through vein matter vertically to 28 ft., when a large and well-defined vein was struck, ehowing 3½ to 4 ft. between walls. On the Justice a depth of 50 ft. has been sunk, the entire ledge carrying assays averaging from $10 to $75 a ton. The whole ehaft is in a fine character of quartz; 6 men are at work.

Cornucopia.—Shaft has been sunk 40 ft. through ledge matter all the way. On Thursday mineral was etruck iu the hottom of the shaft assaying from $25 to $40.

Crown Point—Shaft down 40 ft. and still sinking.

Pioche.—Is looking well. Quantity and quality of ore raised is increasing all the time. About 300 tons of good ore are on the dump.

Silver Peak.—The mine has temporarily suspended work.

Page & Panaca.—Sinking of shaft still continues, with good headway. The engine will be here in place hefore the end of the month.

Red Cloud.—Shaft down 140 ft. and still sinking on contract work. Mineral is coming in through the ledge matter on the bottom.

Alps.—Sinking of the new working shaft still continues and is going ahead rapidly.

Condor.—Improving daily and looking well throughout. Assays from the ledge in shaft, taken on Thursday showed $197.20

Maggie.—A new contract for sinking the shaft 50 ft. more has heen let.

Raymond.—Shaft down 180 ft., while work is pushing ahead with all possible speed.

Peavine.—Sinking from the 82 ft. level; ledge continues good on the bottom; 3 shifts are at work, and the mine looks well throughout.

Mazeppa.—Work was suspended about the middle of last week, but it will shortly be resumed again. About 25 tons of good ore on dump.

Huhn & Hunt.—Shows a large quantity of fine ore on dump. Work going ahead rapidly, with a full force.

Sterling.—Shaft down 70 ft. and work going on steadily.

Excelsior.—Still running connections for air.

HUMBOLDT.

Bullion.—Unionville *Silver State*, May 11th: Amount shipped from the Arizona, since our last issue, was $8,599.

Golconda.—The mine opened and being worked by W. C. Gregg, is, as work progresses, becoming richer and richer.

Central Dist.—Prospects are brigbter and more encouraging than ever before, the mines giving good yields of rich chloride and sulphuret ores, ranging from $50 to $1000 per ton. The Marietta Co. recently made a etrike of 18 inches of chloride and sulphuret ores at 150 ft. from the surface, which continues to increase in size and richness as they go down. They have a 4 ft. vein of splendid ore in their 30 ft. level.

Rich.—We were shown some very rich specimens of silver-bearing quartz, this week, taken from a new discovery, in Star Dist.

Increasing.—Gov. Fall is employing all the men that can be obtained in this locality on the Arizona mine, and has found it necessary to send elsewhere for miners.

Will Commence.—Gen. L. A. Buckner, owner of the greater part of the Montezuma, will commence work upon it in a few days.

Started.—The Pioneer Mill, idle for some time, is again at work.

Valuable.—Developments being made in the Eagle mine, Spring Valley Dist. are causing a good deal of excitement among mine owners in that vicinity. The ledge where exposed, is said to he fully 8 ft. wide and literally studded with gold from wall to wall.

REESE RIVER.

Diana.—Reese River *Reveille*, May 4: Lesees at the 300-ft. level are running a cross-cut for the ledge.

Morgan & Muncy.—The Manhattan Co. are taking out large quantities of splendid ore.

Yankee Blade.—A number of tons recently worked from Kane's mine at the Mauhattan mill returned $800 per ton.

Ophir Canon.—The Murphy main incline is down about 275 ft. A sufficient quautity of ore that will work $150 per ton is being taken out to keep 10 stamps running.

Belmont.—The El Dorado South is working 26 men, sinking the incline and runniug levels. The main incline is down 380 ft. A fine body of rich sulphurets has been strnck near the bottom; 200 ft. from the main incline in the south 240-ft. level, a rich body of chloride ore has been struck which runs up towards the surface. The ledge at this point is 6 ft. wide.

In the old Canfield ground on the Transylvauia ledge, the Belmont Co. has struck a 3 ft. ledge of fine sulphuret ore in a level near the main incline ahout 150 ft. from the snrface.

A shaft is being sunk on the Washingtou Heights which will strike the ledge at about 100 ft. from the surface.

A rich strike of chloride ore has heen struck iu Bennett's claim at Jefferson Cañou about 25 ft. from the surface. The ledge is over 3 ft. wide at that depth. The Sailor Boy ledge is looking well and is yielding quite an amount of $1,000 ore.

WASHOE.

Local Summary.—Gold Hill *News*, May 11: Belcher.—Daily yield, 300 tons, from the 1,100-ft. level. The ore breasts all continue looking and yielding splendidly.

Lyons & Leland.—The mine is in the big hill south of the old Trench mill, and a tunnel 230 ft. in length is jnst cutting through to the ledge. It has already passed through a front ledge containing good ore, aud the back ledge, 120 ft. further, is thought to be about 30 ft. wide.

Silver Hill.—The erection of the hoisting works is progressing rapidly.

Yellow Jacket.—Daily yield, 50 tons fair grade ore from the old portions of the mine. The deposits of ore found recently in the 1,300-ft. level, near the Kentuck line has been cut through and is only 7 or 8 ft. wide, very low grade ore, not worth taking out.

Sierra Nevada.—Amount of ore extracted and worked during the past week, 385 tons.

Crown Point.—Daily yield 440 tons. The yield for April was $819,549.67 from 11,478 tons of ore, being at the rate of $65.67 per ton.

Chollar-Potosi.—Yielding nearly 200 tons of ore per day from the old ore producing sections. Bullion shipments for April $77,614.

Savage.—Daily yield 100 tons, the average assays of which are $38 per ton.

WHITE PINE.

Treasure Hill Mines—North Aurora. White Pine *News*, May 2: Sixty to seventy tons of ore are extracted daily from the Ridsdale chamber.

Beecher Con.—The tunnel is iu 240 ft. At the end an incline is down 50 ft., with a fair quantity of ore in sight.

Mammoth.—Extracting ore from open cut and piling on dump. The dump will mill $50 to the ton. The ore has improved in grade tbis week. An assay made Thursday, turned ont $91 silver and $5 gold.

Ward Beecher.—The winze from the Phillpotts to connect with the east drift of Lady'e chamber has connected,

ORIGINAL HIDDEN TREASURE.—A force of 22 men was put on this week, and is embloyed breaking down oro and hoisting to the dump.

SILVER WAVE.—The oro in tho Boswell chamber is showing well.

COPPER GLANCE.—Tho ore has increasod in quantity.

Arizona.

MINES AND MINING.—Prescott *Miner*, April 27: The Del Pasco 4 stamp mill, in the Bradshaw mountains, after a run of 3 days, made a clean-up of $1,500.

THE TIGER Co. have lately sacked somo 20 tons of their best ore for shipment to S. F., and it is estimated that between $200,000 and $300,000 worth of ore is now piled on the dump.

Mr. Walsh reports the location of a silvor hearing vein of great promise, by himself and others. The vein is named the Heathen Chinee, and is somo three-fourths of a mile southeast from the Benjamin. Work on the Benjamin is progressing and a level is being run to connect the 2 main shafts.

Sale has been made of a location on the Bismark to Hutchinson & Blair, at good figures. J. M. Sanford has sold to N. L. Griffin, his interest in the Bismark and other mines for $2,00).

SOME 50 men at work on the Upper Lynx Creek, most of whom are getting good pay.

Several parties have arrived iu town from Arizona City and Ehrenberg, Yuma Co., who report aome activity in mining on tho Colorado. Poindexter, McGee, Spann, Radcliffe, and others are workiug placer diggings aud making fair wages.

Mr. Huhhard is anperintending oporations at the Planet copper mines with a amall force, and is doiug woll. He is shipping from 20,000 to 30,000 lbs. of good ore by every ateamer.

C. Borger has been erecting a 10-stamp mill to work ore from the Constancia mine, 16 miles east from Ehrenberg, which is snpposed to he running, as it was intended to start up last Monday.

Utah.

EXCITEMENT.—S. L. *Tribune*, May 7: We hear that there is considerahle excitement in Ophir and Dry Cañon over the recent disoovery of some extraordinary rich ore in the later camp. The new strike is represented as heing over 3 ft. thick and assaying $10,000 to the ton.

SAN FRANCISCO DIST.—A numher of specimens from different mines in the Dist., picked out by the men working upon them, vary in value from 18 per ceut. lead and $5.27 silver to 31 per cent. lead and $10.18 silver.

LITTLE COTTONWOOD.—Cor. same: "A rich atrike has jnst been made in the Wellington and in the Lexington. In the latter they are drifting through the vein at 40 ft. deep to ascertain its width. It is in 10 ft. with no hanging wall yet; foot wall well defined.

GOING TO WORK.—About 100 hands have been put to work on the Howland & Etna Tunnel sites in Little Cottonwood Canon within the last week.

BIG COTTONWOOD.—Cor. aame: Work on Kelser Creek is being pushed ahead vigorously.

The Sailor Jack is working 7 men.

The Belle of France Tunnel, on the east slope, is 65 ft in, working 4 men. The Wide West has just resumed work, 2 men.

Tho two Robinsons' mines, which has been working all winter, has an incline of 120 ft and is running a level at 65 ft; 3 men are at work.

The McDougall, to the northeast, have a tnnnel 83 ft in and an incline ahout 40 ft, and about 200 tons of ore on the dump; working 3 men.

On the opposite hill, hut fnrther up the fork, we find the Reed & Benson resumed work with 12 men.

Northwest is the Robert Emmett, which has been working for the past 6 weeks. Still below ia the Comet, which has been working for the past month.

Among the claima on which work will be reaumed are the following:

The Argenta, on the Reed & Bonson Hill. On the peak are the Homeward Bound, Home Ticket, George Washington and Niagara.

At Sonth Fork, Big Cottonwood, Joseph Mullen, of the Mullen mine, is pnshing ahead work, and at a depth of 110 ft. with 3 ft. of ore; 7 meu are at work. The Zoe, near by is a hig thing, going well up in copper, silver aud gold.

The Robison will start up soon.

BLACK JACK AND BUTTERFIELD CANON.—Cor same: First comes the Lucky Boy, or Osceola, (now cons.), lately purchased by Cummings & Co., who are working about 30 men. Two tunnels tap the ledge at 100 and 160 ft., showing a magnificent vein of ore some 7 ft. in width.

The Gladstone has a shaft down 45 ft. which exposes a fine vein of 5 ft. A tnnnel is in 100 ft. which will tap the ledge at 140 ft. Three shafts are running and work is being vigorously pushod. Assays rango from $80 to $160.

The Minerva has a ahaft down 25 ft. which shewa a vein of ledge matter somo 12 ft. in width, and a vein of ore 2 ft. A tnnnel is being vigorously pushed that will tap the ledge at 200 ft. Three ahifts working. Assays range from $90 to $600.

The Occidental has a tnnnel which taps the ledge at 60 ft., and shows a fine vein of oro 2¼ ft. in width. Two shifts working.

Tho Old Times has a shaft down 20 ft. showing a hnge vein of ledge matter and some ore. A tunnel is in 120 ft. which will tap the ledge at 90 ft. At present they are drifting on a spur and have good ore. Two shifts working.

The Loadstone has a shaft down 40 ft. and has a vein of carhonate ore of 10 inches. Two shifts are working. Assays from $90 to $380.

The French Spy has a ahaft down 60 ft. and has a vein of chloride ore of 10 inches. A tunnel is started that will tap the lodge at 200 ft. Two shifts working. Assays range from 90 to 1,900.

There are some 200 locations made in this and Butterfield cañon, bnt as yet thoy are not snfficiently developed to determino their worth.

[Owing to press of important matter our usual summary from Colorado, Idaho and Montana, is laid over till next week.]

San Francisco Stock and Exchange Board.

THURSDAY, MAY 16.

The sales at the Board for the week ending, on the 8th inst., amounted to $6,357,000, which was $2,000,000 less than the previous week. Since May 7th, $235,000 has been received from the Meadow Valley mine, and on the 9th inst., tho Raymond & Ely sent down $32,000, and on the 13th $31,900. The Chollsr Potosi yielded last week 1,000 tons of ore, assaying $40.70; the Hale & Norcross yielded 900 tons and the Ssvage 960 tons, assaying $34.80 per ton. This month, Belcher paid a dividend of $312,000; the Raymond & Ely $210,000; Yule Gravel, $5,000; Eastport Coos Bay Co., $2,500; Meadow Valley, $60,000 and Crown Point $480,000, making a total of $1,069,500. The Crown Point dividend is the largest ever paid by any of our companies in a single month. The Mahogany sent down this week $7,600 in bullion.

A most disastrous bresk hss occurred in the Stock Market, and all descriptions have fallen. The psnio is wide spread and the names of losers are heard on every side. As a general thing, the rise culminated during the last week in April, and since then, the depreciation has been rapid, and for most all descriptions. On Friday the 10th, a little improvement over the hreak, on the previous Wednesday was shown, as prices with some were as high as they stood previons to that event. On Monday business was quiet and nearly sll kinds lower. Tuesday there was a break, snd the average decline was from $20 to $50. On Wednesday, although it wss supposed by many that stocks would rally, a marked decline was apparent on nearly all kinds. Confidence was pretty generally shaken, and the msin purpose of dealers was to get offas lightly as possihle. To day there was a slight reaction but the tone of the market is quite weak. The informsl sessions of the Board hsve been dispensed with since they detract from the interest at the regnlsr sessions, and business at that session has declined.

This panic hss been brewing for some time and although the mines themselves are ss good as thcy were during the hight of the excitement, the impression hss gained ground thst the prices of many descriptions were far above their real value. The sensational rumors and statements concerning the Yellow Jacket mine have also had a marked effect in depreciating valucs. Some suppose that it is merely a dodge for certain parties to buy in certain stocks, before existing developments became known. The ahundance of the supplies in some of our leading mines will no doubt hring them up again in the markot, and it is to be supposed that some othcrs will eventually, be carried up with them. Whether they will ever get up as high again as they have been recently is an open question.

A number of companies have recently "watered" their stock, among them the Crown Point, which has increased the nnmher of shares from 12,000 to 100,000 which will give small buyers a chanco to invest in that renowned property. On Wednesday, in the Board, whon everything else was falling, Crown Point was offered at $1,300, which wss taken; $1,350 hid and taken, and $1,400 hid and taken, and the lattor amonnt hid for more, hut there was nohody who wanted to sell. At this, there was a general applause among the brokers and operators, a very nnusual occurrence. It is to he hoped that now this extraordinary excitement in stocks has partially subsided that the new companios and the old ones too will look more to actual ore developments than to stock fluctuations, and that those who are too poor to afford it will stick to some legitimate business which is attended with less risk. Mine if you want to, hut do it in the proper manner, not with certificates of stock. The peoplo who did not draw out in timo aro completely demoralized, and a number of failures aro expected, nnless prices go up considerahly in a short timo.

Meetings and Elections.

At the annual meeting of the Empire Mining Company, held on the 14th inst., the following gentlemen were elected Trustees for the ensuing year: Hill Beachy, J. S. Kennedy, Geo. W. Beaver, M. Herman, and C. F. Balcom. The Board organized by the election of Hill Beachy, President; J. S. Kennedy, Vice President; C. F. Balcom, Secretary and Treasurer, and A. P. Minear, Snperintendent.

At the annual meeting of the Pea Vine Silver Mining Company, held on the 14th inst., the following gentlemen were elected Trustees for the ensuing year: J. B. E. Csvallier, C. W. Fox, C. P. Hall, E. Skerritt, C. F. Schulze. The Board orgsnized by the election of J. B. E. Cavallier as President, C. W. Fox ss Vice President, and C. F. Balcom as Secretary.

The Orient Silver Mining Compsny, on the 13th inst., elected its Trustees ss follows: J. A. Pritchard (Presidcnt), A. T. Hatch, J. Dods, S. A. Raymond and H. H. Day. Joseph Maguire was appointed as Secretary.

The Washington & Creole Mining Company have elected A. J. Boile, Jr., and S. Linkton Trustees, in plsce of P. E. Connor and Henry Janin, resigned.

A. C. Hamilton has been appointed Superintendent of the Savage mine, in place of F. B. Shamp.

The William Penn Consolidated Mining Company will hold a meeting on the 15th of June, to consider a proposition to increase the capital stock from $810,000, in 27,000 shares, to $1,350,000, in 27,000 shares.

The Best & Belcher Mining Company held a meeting on the 13th inst., and resolved to increase their capital stock from $448,000 to $2,240,000, in 22,400 shares.

The Bacou M. & M. Co. will meet on the 1st of June, to consider a proposition to increase their capital stock from $800,000, in 4,000 shares, to $2.400,000, in 24,000 shares.

The Hot Springs and Geysers of Montana.

[Concluded from page 178]

The Yellowstone Basin a Volcanic Crater.

This bssin has heen called the vsst crater of an ancient volcano. It is prohahle that, during the Pliocene period, the entire country drained hy the sources of the Yellowstone and the Columbia was the scene of as extensive volcanic activity as that of auy portion of the globe.

It might be called one vast crater made up of thoussnds of smsller rents and fissures, out of which the fluid interior of the esrth, fragments of rocks and volcanic dust have heen erupted in unlimited quantities. Hnndreds of the cones of these volcanic vents are now remaining, some rising to a hight of 11,000 feet ahove the sea. Mounts Dosne, Lsngford, Stevenson and over a hundred other pesks msy be seen from any high point on either side of the hssin, esch of which was once a center of eruptiou. Indeed the hot springs and geysers of this region are only the closing stages of that wonderful period of volcanic sction which began in Tertiary times—the eecape pipes or vents for those internal fires which were once so active, but are now dying out.

Even at the present time there are connected with these manifeststions of internal heat, earthquake phenomena which are well worthy of attention. Shocks are not uncommon and are, at some eeasons of the year, very severe.

Yellowstone Lake—Singular Parasite—Formation.

Yellowstone lake is ahont 22 miles long, averages 10 or 15 miles in width and hss an unusual average depth, although the greatest depth is about 300 feet. It is fed hy the snows which fall upon the surrounding mountsin rsnges and is the most heautiful sheet of water in the West. The clear green shading, with the deep ultramarine hue of the wsters, adds not a little to the effect of the scene. The lake has at all eessons nearly the tempersture of cold spring wster. It lies 7,427 feet above sea level. But one species of fish were found, a trout, weighing from 1 to 3 pounds esch. They are very ahundant, but generally infested hy a singular psrasitic worm, which (called *Dibothrium cordiceps)* is found in the abdorminal cavity, or interwoven in the mueculsr portions in sscs or cysts; or sometimes in the gills. Possibly this diseased condition of the fieh is caused by the proximity of the hot springs so abundant all around the lake shore and sometimes extending far out into the watere.

The lske basin is prohshly due in part to erosion. All along its margin are high hanks and terraces composed of a moderu stratified deposit, pnesing up into an aggregation of sand, pehhles, etc., which is often cemented into a tolerably firm conglomerate. These deposite, made np of eroded volcanic rocke, have sometimes the white appearance, and somewhat the composition, of the Pliocene clsys, marls and ssnds of the lake-hssins along the Missouri and the lower Yellowstone. In the northern portion of the basiu these deposits reach a thickness of 300 to 600 feet and must he of the lster Pliocene age, perhaps extending down to the present time. The two lakes were then connected, although probably never completely united. The belt of mountains which separated them was ahout 4 miles wide. It is estimated thst, since the period of volcanic activity, the lake has been about 500 feet decper than at present. During the time of the greatest volcsnic action, the water must hsve covered the loftiest peaks, for many of hem are composed of the breccia or conglomerate in a regularly stratified condition. The ares of the lake is now gradually, but very slowly diminishing.

Hot Springs—Brimstone Basins—Sulphur Mt.

On the shore of the southwest arm of the lske is a group of hot springs covering a belt 3 miles long and 1 mile wide. These springs have built up a series of beds or stratra, 25 feet thick in the aggregate, composed of laminse of silica. The shores are covered with the decomposed siliceous crust.

Many of the springe are constantly boiling with violence, but rise and fall every second or two, with each pulsation throwing out a small quantity of water. Quite a pretty symmetrical funnel-shaped crater is found, with a circular rim varying from a few inches to several feet in diameter. Some of theee chimneys extend out into the lake several feet, and hot spring depoeits may he seen through the clear depths for 50 yards. The eame variety of colors, quiet and mnd springs, old ruins, etc., as before described, occur here, hut, hut no geysere.

On the east and northeast side of the lake are groups of living and dead springs. High up on the monntain sides are two extension patches of siliceons deposit, resemhliug at a distance an immense enow bank. They are called brimstone basins by the monntaineere, on account of the great quantities of sulphur mixed with the silica.

At steamboat Point two vents constantly pulsate, throwing columns of steam to a hight of 100 feet or more. Dead and dying springs in great numbers occur along the shore and high up among the foothills, a mile or two from the lake. One of the most conspicuous of these great white hills is called Sulphur Mountain, at the north end of the lake. The summit of this deposit, from 50 to 150 feet thick, rises 600 feet above the lake. Silica predominates, mixed with oxide of iron, sulphur, etc. At the foot of the mountain are a few springe with a temperature of 150° to 180°.

East Fork of the Madison.

Leaving the Yellowstone Basin and pursuiug a westerly course we cross the high range between the Yellowstone and Madison rivers, striking first the eources of the Esst Fork of the Madison. Groupe of dead and dying springe are met every few miles. Oue locality, covering several acres, is most heautiful. The entire area is covered thickly with cornical mounds of various sizee, ranging in diameter from a few inches to a hnndred feet or more, and full of orifices from which streams were issuing. All theee little orifices sre lined with hrilliant crystsls of sulphur. The hssis of the deposit is silica, white as snow, but variegated with every hue of yellow from sulphur and with scarlet or rose color from iron oxide. In the distant view the sppearance of the whole country may be not unaptly compared to a vast limekiln in full operation. The esst branch of the Madison is slmost entirely fed from the hot springs and its temperature is 60° to 80° all the time. The vegetation along its branchee and in the stream itself is a marvel of luxurisnce. The monntains on either side are composed of hassit and obsidisn. Surface waters render the valley one vast bog.

The springs grow more ahundant as one proceeds down the valley and nesr its junction with that of the Madison occurs, on both sides of the stream, a lsrge group of boiling and quiet springs, with basine from a few inchee to 50 feet in dismeter, and temperaturee ranging from 100° to 197° F. At this elevation the hoiling point is 192° to 196° F.

Great Geyser Basin of Firehole River Architectural Fountain.

From the last mentioned springs one crosses hetween isolated huttes of hasalt and hot spring msterial, into the Grest Geyeer Bssin of Firehole river. The entire valley, 3 miles wide here is covered with a snow white siliceous crust, and columns of steam rising among pines on the hillsides, denote the presence of springs. Some of these hsve most hesutiful bssins.

In the Lower Geyser Bssin are many interesting springs, riddling the whole area of 3x5 uiles, but no geysers of the first clase. Geysers however, there are, with rather regular periode of activity, throwing up wster colmns 15 to 30 feet high. One spring here has huilt up a most elshorate and beautiful cistern. It is called the *Architectural Fountain.* The whole hasin is about 150 feet in diameter. Near the center is the rim of the spring, ahont 25 feet in diameter. The water is in constant agitation, occasionally spouting up a column of water, 30 to 60 feet high, like an artificial fountain, and filling up the reservoirs and the sides for a radius of 50 feet or more. The siliceons sccumulstion made hy this spring descends for several hundred feet in innnmerable semi-circular steps, and is exquisitely beautifnl in sll its detsils.

In the Firehole basin silica predominates in the deposits, with little, if any, lime, and small quantities of sulphur.

Remarkable Mud Springs—Interesting Picture.

There is here a remarkable group of mud spriugs, one with a hasin 50 ft. in diameter, which is covered over thickly with puffs, like an immense cauldron of hasty pudding. The exact symmetry of these puffs, their uniform size and fineness of msterisl render them exceedingly beautiful; and there is among them every shade of color, from a hright scsrlet to the most delicate pink or rose, with a hase as white as snow. The white siliceous clay, when dried, has the appesrance of the finest merschaum. The most fastidious manufacturer of porcelain would go into ecstacies over this magnificent bed of mortar, which hss perhaps been worked and re-worked for msny thousands of years.

These springs occur everywhere, often close to geysers or clear quiet springs, and are in every state of consistency and temperature. When the heat hss diminished to 160°, iron oxide is deposited in a coating, which, in the old springs, hecomes hroken up and is suspended all over the sides like rotten, mouldy frsgments of lesther. When the springs entirely dry up, these are blown away by the winds.

Near active geysers the surface ie covered often with a jelly-like substance. All over the surface are irregular depressions with eharp raised edges, like the inner surface of a cow's stomach. Silicified wood is found in every stage of petrifaction.

In the early morning this valley presents a most interesting picture, columns of steam rising from a thousand vents and completely shrouding it as with a dense fog. A view of the city of Pittsburg from a high point would convey some idea of the appearance, except that pure white feathery clouds of eteam replace the dense black smoke.

Wonderful Geysers.

Up the Five-hole river about ten milee, and near the source, there is the Upper Geyser Basin, where the great geysers are found.

One geyser, near the center of the hasin, operated twice during our stay of two days. First comes a tremendons rumhling and shaking of the ground, then an immcnse mass of steam hursts out of the crater as from an escape pipe, followed by a column of water eight feet in diameter and rising hy steady impulses to a hight of 200 feet. The wonderful fountain continues to play for the space of fifteen minutes; then the water gradually subsides and settles down in the crater, ahout two feet, and the temperature slowly diminishes to 150°. There are here two eeparate basins, one in constant agitation, while the other playe only at intervals of ahout thirty-two hours; and although, so fsr as the eye could detect, there wse a partition of not more thsn two feet in thickness hetween them, neither eeemed to be affected hy the operation of the other. The decorations about the springe were beautiful heyond deecription, outrivslling the most delicate embroidery in variety and complexity.

Sawmill Geyser, with a emsll elevsted crater two feet high, throws up a small column of wster ahout twelve feet, by continued impulses, like the movement of a saw. Castle Geyser has a crater forty feet high, and 150 to 200 feet in diameter, built up of thin layers of silica which rise, like steps, to the chimney on the summit, which is about ten feet high. Clouds of steam issue constantly from this chimney, and every few moments a column of wster is thrown up fifteen to twenty-five feet. Another geyser, "Old Faithful," operates every hour, throwing up a column of water, six feet in diameter, from 100 to 150 feet. When about to mske a display, very little warning is given. There is simply a rush of steam for a moment, and then a column of water shoots up vertically into the air, and hy a succession of impulses is apparently held steadily up for fifteen minutee, the water falling directly back into the crater and overflowing in large quantities. It then ceases, and with a rush of eteam for a few secouds closes the display for the time.

Conclusion.

The two kinds of deposits in these regions, cslcareous and siliceous, have heen previously mentioned. According to Dr. Peale's analyses

LUSHER'S PATENT VEGETABLE CUTTER.

the (White Mountsin) springs on Gardiner's River deposit carbonate of lime mostly. There are present, also, sulphate of magnesis, chloride of lime, sulphate of soda and a little silics. In the Firehole Basin deposits not a trace of lime was detected, but about 85 per cent. of silicia, 11 per cent. of water, and the rest mostly chloride of msgnesia; and only a slight trace of lime was found in the water. In hut one locality west of the lake, Colonel Barlow found a calcareous deposit. There are, scattered over the great area of about 40x50 miles, a few patches of the sedimentsry rocks, and it is most probable that under the deposit of thie small group of springe there are portions of the carhoniferous limestone.

So far as ascertained in all the deposits of the Yellowstone Basin proper and of the Firehole Bssin, silica is the predominant constituent. The springs are, with very few and importsnt exceptions, near the borders of strcams helow any limestone beds. It is quite possible that underneath the vast masses of volcanic material which compose the mountains on every side, the sedimentary rocks exist, hut probably only in isolated and much restricted patches, if at all.

It may therefore be stated, in geueral terms, that the great hot spring region of the sources of the Yellowstone and Missouri rivers is covered with rocks of volcanic origin, of comparatively modern date.

Circulation of Sap.—It is maintained by scientists that the sap of trees ascends in the Alhurnnm or ssp-wood, and descends between the Alburnum and the bark, where it forme a layer of new wood—a theory that has led to many experiments. Mr. Williams applied it to the early maturation or ripening of grapes; he found by taking off one-quarter of an inch of the hark in width, that the sap was impeded in its descent, the parts above became lsrger, the fruits swelled and ripened early hy many days.

Zante, the well-known Mediterranean island, is said to have exported over 25,000,000 pounds of currants the last year, and about 86,000 barrels of olive oil.

Lusher's Patent Vegetable Cutter.

Our illustration represents a very eimple but useful device for elicing all manner of vegetatahles. It is one of those really excellent little things, that while their cost is hut trifling they can hardly be diepensed with when once brought into use. As the knivee are tinned, they cannot rust, and yet have a good cutting edge thst will last for years. They are essily kept clean, as they are made all in one piece, and are perfectly smooth.

All kinds of vegetables can he cut with them, cabbagee, potatoes, applee, pears, turnipe, carrots, beets, cucumbers, radishes and onions. Six slices are thrown off with every stroke of the hand, so that enough can be prepared for a large family in one minute.

One cutter eent—postage or expressage free—to any address, for $1 50.

Address, Weister & Co., 17 New Montgomery Street, San Francisco.

Working Gold Ores in North Carolina.

A correspondent in the *Scientific American*, engaged in gold mining in North Carolina, writes as follows on the subject of Amalgamating Gold Ores:

A great majority of mines yielding free gold produce ores that will not work more than ten dollars per ton; and, of course, a large quantity must be worked to make it pay. Hence, any process that is not rapid and cheap will not answer.

As to the working of sulphuretted or "rebellious" ores: Of the hundreds of patented and other processes, hardly one is worth a moment's consideration. It may be said, however, that many of the eo-called improved and newly discovered methods work well enongh in the laboratory, but, when put to a practical test, are found to be worthless.

After many experiments, I have found the following process to be the best: I first roast the ore (though it is free gold ore) in large piles, thus rendering it very friable, and thoroughly drying all the dirt and clay. In every ton of the ore, there is about 300 pounds of fine rock and dirt, which I have screened out through wire sieves of about one-quarter inch meshee, and this fine stuff I run through a common drag mill, and then through a "Georgia rocker," thue saving nearly all the gold. In fact, by this simple process I obtain nearly fifty dollars of gold per ton of dirt; whereas, when run through the stamp mill and over copper plates, I obtain only about ten dollars per ton. The rock I crush in one of the Wilson patent stamp mills, using qnicksilver in the battery, and then running the crnshed matter over the ordinary copper plates. The rock is worth fully ten dollars per ton, but I save only about half of this.

As to working tolerably high grade sulphuretted ores: The best way, if not too far from a shipping point, is to send them to Swansea, England. But if this cannot be done, then erect a common furnace, having the fire surfaces of good soapstone; then, to every 150 pounds of ore, put in one bushel of charcoal and ten per cent. of salt. The ore will readily melt to a slag, and will be pretty well desulphurized. The slag can be drawn off, and when cold can be broken up and worked like free gold ore. A small trial furnace can be built of good fire brick, and an ordinary blackemith's bellows will answer to blow the fire.

As the loss of gold, by the present process of amalgamation, is known to be very great and, in many cases, disastrous to those engaged in mining, it is important, it seems to me, that the different processes which have been found to work the best, by different miners, shonld be made known to the public. In this way much good may be done, and a great industry made more valuable than it is.

A Compliment.—W. H. Bruckner, author of "American Manures and Farmers' and Planters' Guide," Monroe, Michigan, writes: While in Philadelphia, I frequently heard the Scientific Press, of San Francisco, lauded by scientific men who had lived in California. I am pleased to bear witness to the truthfulnees of their statements. That journal (and Pacific Rural Press) reflect no little credit on the publishers.

A Novel Mouse Trap.—The *Evening Mail* "norates" that a mouse in Belfast, Maine, was found, the other day, frozen stiff upon a hammer. Investigation showed, that in picking up something that lay on the iron head of the hammer, the tonge of the monse had frozen to it, and, being unable to get away, it died.

Useful Information.

Good and Poor Varnish.

Good varnish is difficult to get; one trick of the trade is to use but little gum, and putting into the linseed oil, white vitriol and sugar of lead, rendering the oil nearly thick enough for varnish before any gum is added. Another cheat is to make cheap, sticky, worthless stuff by using raw oil without dryers; because, if a black, stiff, worthless article dries quickly (and cracks and scales quickly also), a light colored, limpid, slow drying article must be good.

Twenty years ago we mechanics up here in Vermont made our own varnish and japan; it was the only way by which we could get anything reliable. In the meantime, Mr. Abbott, of New Hampshire, got Moses Bigelow to go up to Concord and make varish for the carriage shops; and then we commenced buying of Mr. Abbott. Since that time, we have had dealings with all the manufacturers in Boston New York, and Newark, and, until the recent war, generally got good varnish; but during the war adulteration found its way into every manufactory, and even to-day a good article of varnish is perhaps, stored in one cask ont of a hundred, and there are two ways to get it. One is to make it, and the other is to eschew dealers and speculators; buy of the maker, pay just what he asks, and, if your custom is worth anything, you will get a good article. Otherwise, doubtful.

The best copal varnish is made as follows, Take three pounds of the best Zanzibar copal gum to every gallon required, pulverize the gum in an iron mortar, and then put it into a copper pot which will hold double the quantity required; fit a cover to the pot with a small hole in the cover, through which to insert an iron rod to stir the gum when melting; heat over a slow fire until thoroughly melted, stirring it constantly during the process. In the meantime, put into another pot and over another fire 1½ pints of raw linseed oil to every pound of gum in the first pot, boiling as usual for ordinary purposes, keeping it hot until the gum is thoroughly melted. Then remove from the fire to a distance of twenty or thirty feet, pour the oil in gardually, stirring at the same time; and while still hot, add sufficient turpentine to reduce the gum to a proper consistency, which can be tested by dropping a little from the end of the rod on a piece of glass to cool in the air.

The gas arising from a hot pot of varnish is very inflammable; and if the steam, by floating around, reaches the fire, it will flash as quick as gunpowder, and the face and hands of the workman will be burned and the varnish set on fire; therefore remove to a distance before adding the turpentine, also have a wet cloth ready to throw over the fire in case of accident. When all is mixed, strain, while quite hot, through and a funuel partly filled with clean flax, through which not a speck of unmelted gum, dirt, or settlings will pass. If flowing varnish is required, add a trifle more oil, with no dryers except a little red lead. If hard or scraping varnish is required, use but half a pint of oil to each pound of gum, and boil hard will plenty of dryers.—*Cor. Sci. Am.*

Difference in the Value of Diamonds.—While many can approximate the value of a diamond, few can appreciate its exact worth. All know it to be the most expensive of all substances (excepting rubies of rare color and size), from its beauty, rarity, and indestructibility. The diamond which first decked some fabulous Indian god would blaze to-day with all its fire if adorning some fair American woman. Not a single aparkle has been dimmed, nor an atom of its weight lost. Where the real difficulty exists is to make the public understand the comparative merits of various gems. In the jeweler's tray many stones may be exhibited. They may be all of good quality, but there is a decided choice. This one may have size and purity of color, yet marred by a single flaw; that one, limpidity, without a flaw, yet defective in shape; while a third, even smaller than the other two, may unite every desirable quality, be in fact almost faultless. Combining, then, every excellence within itself, its value is largely enhanced. The comparison between the price paid for a horse and a diamond is not an inapt one. An animal possessing beauty, health, speed, and docility, commands a price far above another having all these qualities save one. It is precisely the same case with a diamond. A stone approaching perfection possesses a value infinitely above one with a single depreciating quality.

Phosphate Candy.—The restoration of the phosphorus to bread, which has been removed in the bran, as so successfully accomplished in the Horsford baking powders, is well known both in this country and Europe. We now hear of a novel way of turning our national love of candy to similar benefit, by employing phosphorus instead of sulphuric acid in sour drops. Mr. Charles Allen, of the School of Mines of Columbia College, has invented a phosphated candy, which he prepares by combining one or more of the acids or salts of phosphorus with sugar, thus ingeniously presenting an acceptable form of assimilable phosphorus to those who need some repair of the nervous and brain forces. It is a plesent way of taking phosphorus as a medicine, and has been deemed worthy of a patent.

A Method of Observing Vibrating Flames.

A cotemporary gives a description of a simple apparatus for observing the phenomena of vibrating or sounding flames. A disk of white card board is constructed with oblong apertures in a radial direction; this is set upon a spindle so as to admit of rotation at the requisit speed.

To examine the flame of a gas light, for instance (the flames being protected by a glass tube from the disturbing effects of air currents), place the disk in front of the light, so that the eye can see the light through each slit as it comes to the vertical position. If now the speed of the disks' rotation is such that the interval of time between two slits passing the eye is just equal to the period of a vibration of the flames, the flame appears to be motionless; but if this velocity of rotation be reduced, the flames will be observed to pass slowly through its changes of form. If the interval is one-half, or one-third of the period of the vibration of the flame, the illusion of a disk having two or three times the number of real slits will be produced. It is only when the periods of flame-vibration and of the over lapping of two successive slits coincide in time, that the flame and disk appear motionless; when this is otherwise, the disk revolves in one direction or the other.

This plan affords a ready means of counting the number of vibrations of a flame, and by substituting a wire for the vibrating flame, the spiral course of the undulations produced in it may likewise be observed. Mr. Charles Watson, who has described the experiment, has made some very accurate observations upon the times of vibrations of flames within tubes of different dimensions.—*Jour. Franklin Institute.*

Enamel for Copper Cooking Utensils.—A preparation for coating copper vessels used in cooking, especially for cooking acid fruits which attack the copper, forming so-called verdigris, may be made as follows: 12 parts white fluor-spar, 12 parts unburnt gypsum, 1 part powdered borax' all intimately mixed and fused in a crucible. The fused mass is then poured out, and after cooling triturated with water to a doughy paint. The copper vessel is painted inside and put in a warm place, so that the mass dries uniformly throughout. When thoroughly dried the vessels are baked, if small, in a muffel' if large, in an oven, until the mass is fused. On cooling it forms a white, opaque enamel, which adheres very strongly to the copper, and is not removed by ordinary blows or percussion, and protects the vessel from the action of vegetable acids. Vessels thus coated may be used for preparing pickles, sauer-kraut, etc., without danger of copper poison.

Use of Soluble Glass in Painting.—Our exchanges still continue to suggest new application of water glass in the arts; but especially in painting where it appears to furnish a means of applying certain colors to fresh wood or clean iron in a most efficient manner, and at a very slight cost compared with oil. It can also be used advantageously for painting houses, basket ware, decorations for theaters, etc., and is especially suitable in the latter case, as it renders wood incombustible to a certain extent, instead of increasing the danger from fire, as with oil paint. Care must, of course, be taken to use only such mineral colors as are not decomposed by the glass, such as ultramarine, chrome-green. Nuremberg-green, yellow and red earth, ochre, green-earth, terra de Sienna, etc. In coating paper with this paint, a little glycerine may be added to prevent its breaking. Corralline, bonceau, and Vesuvine have also been used to advantage in connection with soluble glass.—*Harper's Magazine.*

To Coat Zinc With Iron.—The objects of zinc are dipped in a warm solution of 150 grammes sulphate of iron, 90 grms. salammoniac and 2½ kilograms of boiling water. The sulphate of iron must be free from copper. They are boiled from one to 15 minutes, taken out and the iron deposited removed with water and a brush. This first operation has for its sole object a thorough cleaning of the zinc. They are again placed in a warm sulphuric bath and afterward heated. They are thus covered with a fresh black coating. Without being washed they are put on a brasier of glowing coals and heated as long as sal-ammonia fumes are given off, which requires but a short time.

Three Methods of Preparing Plaster Casts. First, varnish them over with shellac, and the plaster, when poured in, will not adhere to the sides. Second, let the plaster cast absorb some hot bees' wax, which can be applied by means of a paint brush. Third, oil them with sweet oil till they will not absorb, and let them dry thoroughly before using. Or brush them over with melted white wax, and keep moulds hot, so that all wax is absorbed.

Red or Blue Stamping Ink.—An excellent red or blue stamping ink can be prepared by making a saturated solution of fuchsin or sublime blue with pure glycerine, and adding afterwards for the red color madder cake, and ultramarine for the blue, thickening with enough dextrine to give the desired consistency. This color possesses all the peculiarities which are required for good stamping ink.

Male and Female Voices.—Glashier, an aeronaut, says that the voice of a woman can be heard in a balloon when at the hight of two miles, while that of a man cannot be heard when higher than a mile.

Good Health.

Heat as a Poison.

One of the French journals gives an account of some curious expsriments by M. Clauds Bernard on the effects of heat upon animals. It appears from these that heat, when it attains too high a degree, acts like a poison, and destroys feeling and motion. It seems to act directly on the muscular element; and the loss of muscular power necessarially produces death by arresting the action of the heart and circulation. The degree of heat which must not be exceeded for cold-blooded animals is from 113° to 120° F., for mammalia 128° to 131°, for birds 140° to 145°. In each case the maximum differs by a few degress only from the animal's normal temperature.

There is, then, an inward medium, the temperature of which is kept up by that of the blood—a certain atmosphere of heat, so to speak, which should remain unalterable. The artificial increase of this heat leads to the most serious consequences as soon as it exceeds a very few degrees.

To what particular poisons, then, can heat be assimilated? Those must be sought which have a direct action upon the contractile muscular element, such as the *antiar* (the milky sap of the *Upas antiar*), the *vas*, and the *corwal*, American vegetable poisons. These substances, probably, have the same chemical action upon the blood as heat.

The precise action of heat upon the blood is thus stated by M. Bernard: The blood of an animal killed by heat becomes black, the oxygen it contains is rapidly transformed into carbonic acid, and finally disappears. This is not a true toxical action, but rather an excitement of the vital and normal properties of the red particles. The black blood of the rabbit killed by heat is still living; it absorbs oxygen by contact with the air, and again becomes ruddy, if the experiment is tried in time. Between 107° and 190° F., however, the blood coagulates, loses its vital properties, and cannot again become red.

Heat above a certain degree kills the muscles without killing the blood. The chemical character of this poisoning of the muscles by heat is the most obscure part of the subject. It now remains for chemists to analyze the phenomena which accompany the muscular rigidity and cessation of motion produced by heat, and thus to solve the problem of the precise action of this poison, as they have done in the case of certain others.

Sunstroke.—Dr. George H. Hope, M.D., in his work, entitled "*Till the Doctor Comes and How to Help Him,*" gives the following directions for the treatment of sunstroke until medical aid can be obtained: Sunstroke, is a sudden prostration due to long exposure to great heat, especially when one is much fatigued or exhausted. It commonly happens from undue exposure to the sun's rays in summer, but I have seen the same effects produced in a baker from the great heat of the bake-room. It begins with pain in the head or dizziness, quickly followed by loss of consciousness and complete prostration. Sometimes, however, the attack is as sudden as a stroke of apoplexy. The head is often burning hot, the face dark and swollen, the breathing labored and snoring, and the extremities cold. Take the patient at once to a cool and shady place, but don't carry him far to a house or hospital. Loosen the clothes thoroughly about his neck and waist. Lay him down with the head a little raised. Apply wet cloths to the head, and mustard or turpentine to the calves of the legs and the soles of the feet. Give a little weak whisky and water if he can swallow. Meanwhile let some one go for the doctor. You cannot safely do more than I have said without his advice.

Bisulphite of Soda in Throat Diseases.—Dr. Tyrell, in the *Pacific Medical Journal*, commends, as a new remedy in this class of affections, bisulphite of soda, given in large and continuous doses. Diptheria, inflammation of the tonsils, and quinsy, though local exhibitions, have their source in poisonous fermentations of the blood, the same as scarlet fever and other zymotic diseases. It is held that salt prescribed enters into the circulation and retards putrefactive fermentation. Dr. T. failed of success when he administered it in small doses and in three hour intervals; but when he gave thirty grain doses every hour, day and night, so as to saturate the system with the salt, he was almost invariably successful in removing all the severe symptoms in twenty-four hours. He asks physicians to give this medicine a trial, that the curative effects may have more extended proofs.

Consumption.—The late Dr. Marshall Hall, of England, said: If I were seriously ill of consumption, I would live out doors day and night, except in rainy weather or mid-winter; then I would sleep in an unplastered log house. Physic has no nutriment, gasping for air cannot cure you; monkey capers in a gymnasium cannot cure you, and stimulants cannot cure you. What consumptives want is air, not physic—pure air, not medicated air—plenty of meat and bread.

Scarlet Fever.—A Brooklyn physician considers Turkey figs, boiled in water, so as to make a sort of tea, and mixed with a little fresh brewer's yeast, a specific remedy for scarlet fever. He recommends that this simple preparation be used as food, drink and medicine. Try it.

Prescribing for Infants.

The following sensible hints on this subject are from a lecture by Prof. J. O'Reilly, published in the *American Practitioner* for April 1872: There are two points in the general medication of children to which I wish especially to call your attention. One is the subject of thirst, the other is the intervals at which medicins should be given.

In quite a number of infantile diseases the stomach is very capricious, and to keep it quiet is one of our greatest troubles. This difficulty is often caused by the attendant not understanding the difference between hunger and thirst. The sick child is fretful, and cries and pulls at its mother's breast; and she, willing to do anything that soothes it, permits it to nurse. It sucks, and in a few moments rejects the milk; but cries again, and the mother again yields it to the breast only to have the stomach again reject its contents, and thus the fight goes on until the infant is exhausted. The doctor gives medicine to quiet the irritable stomach, and the mother counteracts its effect by over feeding.

What I wish to express is the fact that the child is not hungry; it does not want the breast; but is thirsty and wants drink. In health the breast is food and drink, but in disease the craving is that of thirst, not of hunger, and the stomach which rejects the milk because it is unable to digest it would be calmed by a cool beverage. In other words, were water given to the child in the place of the breast, the stomach would be relieved, and in many cases the child saved. This difference between thirst and hunger in the infant is a point well worth noting.

Medicine should be given to infants in small but often-repeated doses. The interval should be only half as long as that for the adult. The reason for this is that the digestive organs of the infant act much more rapidly than those of the adult, and a medicine to have its effect kept up must be supplied in accordance with its entrance into and disappearance from the system.

The Limit of Longevity — Information Wanted from California.—Sir Henry Holland, in his interesting "Recollections of Past Life," just reprinted, refers to the question whether there is any trustworthy evidence of any human life longer than a century. He himself believes that there have been well authenticated instances of the kind. In the report of the Irish Registrar-General for the third quarter of 1871, the death of six centenarians are recorded. The Registrar of Cookstown District reports the death of a woman aged 102, and a man 108, and says: "I have made careful inquiry respecting these two cases, and have no reason to think their ages are exaggerated; both are remembered as 'old people' by individuals long past their climacteric." In the Dervock District, Ballymoney Union, the Registrar reports "a death at the advanced age of 105 years, authenticated."

It is stated in several medical journals of recent date that "Harvey Thacker, who died recently in California, was 128 years old at the time of his death." If there is satisfactory evidence of this extraordinary longevity, it would be interesting to know more about it.—*Eastern Exchange.*

Varying Effects of Poisons on Different Animals.—It is a well known fact that what is poison to one animal may be taken by another with entire impunity. In illustration of this proposition, we are informed that strychnine, so fatal to most animals, may be eaten by certain species of monkeys with perfect safety. In the case of an East India monkey, known as the (*Presbytis entellus*), one grain was first concealed in a piece of cucumber, which was eaten by the animal with no apparent effect. Three grains were afterward given, and with the same result. To test the strychnine used, three grains were administered to a dog, which proved almost immediately fatal. Another Indian monkey, known as the pouch-cheek monkey, has been found to be more susceptible than the Lungoor, but not so much as the dog.

It is also stated that pigeons can take opium in large quantities with no injurious consequence; goats, tobacco; and rabbits, belladonna, stramonium and hyoscyamus.

The Hoosac Tunnel, according to recent official report, has up to December 31st, 1861, required an expenditure of $6,335,332, exclusive of interest. When the present contractors assumed the management, 9,341 feet had been opened, and on December 1st, 1871, the work had been advanced by 7,737 feet, making a total of 17,078 feet, and leaving 7,953 feet to be excavated. The central shaft has been finished, and the work is now going on at four faces of the rock; much more rapid progress in the future is anticipated. The tunnel, it is hoped, will be finished by March 1874.

Stag Pills.—Pills "purely vegetable," have been a popular nostrum in this country, but in the Celestial Empire those of a thoroughly animal character appear to be in demand. A Chinese druggist at Ningpo invites the public to swallow "Pills manufactured out of a whole stag, slaughtered with purity of purpose, on a propitious day." The wealthy wholesale druggists are in the habit of purchasing large and handsome stags, which they expose in a pen at the door of the shop until "a propitious day" is selected for the animal's conversion into pills, when he is deliberately pounded entire into pulp, from which pills are made.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4: six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1¾ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 6d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, May 18, 1872

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, May 15, 1872.—Legal Tenders buying, 89; selling, 90. Gold in New York to-day, 113⅛.

Table of Contents.

EDITORIALS—The New Mineral Land Law; Corporate and Individual Mining, 305. About Patents, Page 312.

ILLUSTRATIONS — McDonell's Propeller, 305 Lucher's Vegetable Cutter, 310. Diagram of Chilian Mines, 313.

CORRESPONDENCE—Vein Phenomena — Concluded: San Diego Mines, 306.

MECHANICAL PROGRESS.—Russia Sheet Iron; The Hammer vs. the Rolls; Glass-Lined Water Pipe, 307.

SCIENTIFIC PROGRESS.—The Marvels of Nature; The Reproduction of Eels; The Phosphate Sewage Process; Geological Survey of Montana, 307.

MINING SUMMARY—Reports from mines in various States, Counties and Districts: Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 308-9.

USEFUL INFORMATION.—Good and Poor Varnish: Difference in the Value of Diamonds; A Method of Observing Vibrating Flames; Enamel for Co per Cooking Utensils; Use of Soluble Glass in Painting, 311

GOOD HEALTH.—Heat as a Poison; Sunstroke; Bisulphite of Soda in Throat Diseases; Prescribing for Infants; The Limit of Longevity; Varying Effects of Poisons on Different Animals, 311.

DOMESTIC ECONOMY.—Cooking Eggs; Strawberry Syrup; Workingmen's Dinners; Lemon Syrup; Selected Receipts, 315.

MISCELLANEOUS—The Great Bonanza, 306. The Hot Springs and Geysers of Montana—Concluded: Working Gold Ores in North Carolina, 310. U. S. Mining Laws; New Incorporations, 316.

ENGAGED IN A NEW ENTERPRISE.—W. H. Murray, our long-time correspondent and special agent, whose business connections for the past four years, has made him familiar with the wants of a larger portion of the mercantile men and firms of the Pacific Coast, than any other person of our acquaintance, will be the business manager of a new monthly paper now issuing, "THE PACIFIC COAST MERCANTILE DIRECTOR."

GEOLOGICAL SURVEY.—Messrs. Goodyear and Cooper of the State Geological Survey, are at present engaged in making researches in the vicinity of San Diego, between that place and the Lower California border.

THE town of Wadsworth is said to present a very lively appearance lately. Large quantities of freight are received and the teams are busy, making good times for the merchants.

Wm. Regan was severely injured by a premature blast, recently, in the claims of McKillican & Co., at North Bloomfield.

A LARGE steamship is being built for the Japanese Government in one of the Brooklyn shipyards.

PROFESSOR TYNDALL, it is said, has decided on a lecturing tour through the United States during this year.

N. P. LANGFORD, of Montana, has been appointed Superintendent of the Yellowstone Natural Park.

THE Carson mint coined and stamped gold bars valued at $1,107,163 in April.

ON FILE.—Gold *vs.* Silver Mining, Ophir, Utah.

About Patents.

Much has been recently said about various patent systems, of civilized countries; and the general impression seems to prevail, that the American system with some modifications, is better adapted to promote the interests of science and progress, than that of any other country. We need no better proof of this fact, than the immense number of patents annually granted in the United States.

Many of these patents, doubtless, are entirely worthless, and neither benefit the patentee nor the community; indeed, in many instances, they are a drawback to the progress of particular branches of industry, but this can readily be obviated. A system of taxes on patents, say at the end of the third and seventh years of their existence, similar to that practiced in Great Britain, would, doubtless, "weed out" most of these worthless and unprofitable patents, and leave the field open for improvers. We do not advocate a heavy tax, but on the other hand would make the first cost of a patent as light upon the inventor as possible, and then require a small fee at the end of the third year, and another at the end of the seventh.

As the law now stands, an inventor, in order to protect himself, must procure his patent, and if the invention should prove worthless, that patent holds good for the full term of seventeen years, whether it be worked or not. If a person attempts, during that time, to improve upon the invention, he finds his labor lost, as the worthless patent covers sufficient ground, to entitle the holder to stop the later invention, thus the wheels are blocked, and neither of the patentees derive any benefit from the invention, while the public are deprived of its use. The original patentee, having held his patent for several years, without receiving any benefit therefrom, and knowing that the improver's machine cannot be made or sold without infringing the first patent, will, generally, fix a price upon his patent, equal to what he thinks he should have made out of the invention, if he had controlled a first-class machine.

This difficulty, which we consider the worst feature of our American patent law, can be effectually avoided, by the plan above proposed, as there would probably not be one instance in fifty, in which the holder of a worthless or non-productive patent, would put himself to the trouble and expense, of paying the tax, when it becomes due; and thus, his patent would fall, and the claims be free to be used by the next improver.

Another difficulty, which, in our judgment, should be remedied, is the entire absence from the letters patent issued by the Patent Office, of any indication as to the relation which the invention occupies in the art to which it pertains. In other words, we believe, that the government should endorse upon each patent issued, the numbers, and dates, of all prior patents with which a conflict is shown. For instance: A invents and patents a peculiar construction of steam plow. B afterwards patents improvements upon the same machine, which are worthless without he first acquires the right from A, to use what A has previously claimed. Now, we contend, that B's patent, should be so issued, that it will show upon its face, that it is an improvement on A's machine, and that A's right must be acquired, or privileges obtained from him, in order to admit of the patent being legally worked. This is necessary in order to sustain a good and wholesome reputation for our patented inventions, and to prevent purchasers from blindly buying and paying a large sum of money for a patent covering only improvements on a former patented machine, under the belief, that the patent covers the entire machine. Such transactions tend to bring our patent system into disrepute, and cause our people to look with distrust upon all patented inventions.

Every patent, before it is issued, or even granted, is subjected, or should be, under the law, to a rigid and thorough examination, in order to test its novelty. This examination, it is understood—and we have no reason to doubt its truth—is made by examiners, thoroughly competent to judge of the relation which the case under examination bears to every patent previously granted in that class. Now, this being the case, it will require no extra amount of work, to mark each patent with an abstract of the cases upon which its existence depends. This would not only benefit the inventor, by providing him with a memorandum of previous patents, so that he could avoid infringments, and the consequent lawsuits, but also benefits the entire community who are liable to become innocent purchasers of a worthless patent or a lawsuit.

We commend this idea to the Department at Washington, and believe that if it were adopted it would advance the interest of patents more than any other change or addition which can be made on our present system.

It would be a great advantage as well as a satisfaction to applicants for patents if the Patent Office would send to every applicant whose case is rejected, a copy of the specifications and drawings of the references given as meeting his case. This can be done at a very slight expense since the office commenced to print the specifications and photo-lithograph the drawings, and the advantage to inventors would be immense. It is a well known fact that a large number of rejected cases now laying in the office were in reality patentable at the time that the application was made, and the inventor relying upon the dictum of the examiner and the assertion of his agent, perhaps, allowed the case to lay until it became forfeited; whereas, if he had been shown a specification and drawing of the reference he could have readily pointed out material points of difference upon which a patent would have been granted. Besides, if a case is properly rejected, there is no more convincing argument that such is the fact than to show the applicant the previous patent. In view of the insignificance of the expense, and the immense amount of benefit to be derived by applicants for patents by thus furnishing them with the copies of the patents upon which they are rejected, we certainly think that it ought to be done.

We propose, in the future numbers of the PRESS, to give further views of our Patent Law System, and make such suggestions as appear to us to be greatly needed for the better protection, education, and satisfaction of inventors.

SPECTACLES.—We notice that Mr. C. Muller optician and dealer in the Brazilian Pebble, and all other kinds of spectacles, has removed to 135 Montgomery street, opposite the Occidental Hotel. He makes the fitting of spectacles to the eye, a speciality.

LOS ANGELES DISPATCHES.—La Grange and party have returned from Death Valley and report having organized the Abe Watts Mining District, ten miles from, and the nearest district to, that famous locality.

ACKNOWLEDGMENT.—Hon. Cornelius Cole has our thanks for Congressional publications, including the Report of the Commissioner of Agriculture for the year 1870, and the monthly reports for March and April of 1872.

BOONE'S PATENT TIE.—A sample of Boon'e patent railroad tie, which was illustrated in the SCIENTIFIC PRESS recently, may be seen at our office, 338 Montgomery street.

A DAILY stage line is shortly to be established between Hamilton and Pioche.

A PREMIUM sweet potato in Louisiana weighed sixteen pounds, and measured, in circumference twenty-four inches.

MINERALS, ETC.—We have received from W. C. McDougall, a large box containing a number of interesting specimens. Among them are quite a number of beautiful petrifactions; volcanic sands; pieces of lava and volcanic rocks; quartz crystals; a number of pieces of moss agate; a very beautiful and large specimen of sulphate of lime; a sort of clay which our correspondent thinks will do for furnace purposes, but from the sample shown as having been in a cooking-stove fire, which is cracked, we do not think it would stand much heat; also some rattle-snakes' rattles and a number of geological specimens which are not very rare. Mr. McDougall has also sent us in a small box a live tarrantula in his domicil which is of the most ingenious construction and a description of which we will give with an illustration shortly.

QUICKSILVER.—According to the *Commercial Herald*, the price of quicksilver has advanced £2 per flask, in London, with only about 1,000 flasks in the hands of Rothschilds agents. The price is not likely to be any lower here. The *Herald* has also been informed that a new agency has been established for the sale of the product of the Almaden mines, and that an offer of $50 per flask has been offered and refused, for the total product of the mine.

NEVADA ITEMS.—A dispatch from Hamilton dated the 13th says that the books were opened that day, and all the stock of the Eastern Nevada Railroad subscribed. The bulk of the stock is wanted by a certain banking syndicate and was subscribed for by its agent. The mortgage bonds and all other papers have been perfected and sent forward. The President of the Company goes on to Brussels, on receipt of these papers, in New York, to draw the two hundred and fifty thousand dollars now on deposit awaiting his arrival.

MINERS' STRIKE.—Some 1,500 miners in the Lake Superior Mining District have "struck," driven other men from work and threatened destruction of the mining property and death to the owners, agents and superintendents. The Governor has called out the military to suppress the disturbance.

THE ARCTIC EXPEDITION, under M. Octave Pavy, will leave this city, on the 25th inst., in search of the open Polar Sea. It is proposed to cross Wrangles Land, on sledges, and since M. Pavy has perfect confidence in his plans, a rubber raft will be taken to navigate this sea to the coast of Greenland, where ships will be sent to meet him.

MINING ACCIDENTS.—The *Mountain Messenger* records the death of Walter Fay, who was killed by a cave in the American Company's diggings, at Morristown, last week. He was not taken unawares, but did not think the cave would run so far.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 23D, 1872.

NOZZLE.—Randolph R. Craig and Joseph Craig, Nevada City, Cal.; antedated April 13, 1872.

PHOTOGRAPHIC CAMERA.—Hector W. Vaughn, San Francisco, Cal.

CLASP FOR SIDE-ARMS.—Frederick A. Will and Julius Finck, San Francisco, Cal.

TOOL HANDLE.—Frederick A. Will and Julius Finck, San Francisco, Cal.; antedated April 13, 1872.

CAR-TRUCK.—Samuel N. Norton, Sacramento, Cal.

ORE-CRUSHER.—James W. Cummings, Georgetown, Col. Ter.; antedated April 10, 1872.

SOLDERING-TOOL.—Louis McMurray and Robert J. Hollingsworth, Baltimore, Md.; said Hollingsworth assigns his right to Francis Cutting, San Francisco, Cal.

COMBINED KEY-HOLE GUARD AND BOLT-FASTENER FOR LOCKS.—Charles H. Townsend and Abiather F. Potter, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Eberhardt, South Aurora and Utah Silver Mining Companies' Mines.

[Written for the SCIENTIFIC PRESS by HENRY SEWELL.]

Under the above heading I noticed a letter in the *Mining Journal*, of London, dated Feb. 17, and signed, "A Believor in White Pine Pockets." Having had the management of silver mines in Chilo, in stratified limestone formation, for about eight years, subsequently also for two years in Mexico and Spain, producing precisely the same class of ores as those of White Pine, namely: chlorides of silver, called by the practical miner "horn silver," I believe a few observations and data on the above, may be found useful in furthering the interests of mines in like formations in the United States. For till recently, comparatively speaking, they were not known in this country; while the experience in silver mines in Chile dates back as far as 1808, at which period the mines of Agua Amarga, Province of Huasco, were discovered.

The celebrated mines of El Doctor, in Mexico, likewise in similar formation, were worked for about thirty years, producing some forty millions of dollars. In 1836 an Indian of the name of Juan Godoy, having some Guanacos in the Sierras of Copiapo, in Chile, discovered silver mines. Accidentally losing his way he was forced to camp out for the night, collecting wood for a fire, which he had to keep up, in consequence of the cold blasts from the Andes. He chose, to protect himself, a reef that stood out boldly from the ground, or what is called by miners large croppings. Great was his surprise in the morning at finding large pieces of native silver around the spot where the fire had come in contact with the croppings. It was soon found by those who went out to inspect the wonderful riches discovered by the Indian, that great masses of horn silver lay in the stratified limestone formation, and that the native silver was due simply to the fire, which had come in contact with the ore. These mines were vigorously worked from 1836 to 1848, and kept some twelve mills constantly supplied. The crushing was carried on by so-called Chilian mills, the patio amalgamation being employed. In 1838 Mr. Stevenson, an English gentleman, was the first to make an improvement for working these free milling ores, by inventing the Fina or pan system of amalgamation, which was imported from Chile to California in later years.

Everywhere I have noticed that these formations produce free milling ore at surface and to a depth varying from 50 to 250 feet. In one district alone in Chile, called Chañarcillo, it was ascertained by dues paid by the Government, that the amount of silver produced from these formations, in about twelve years, reached the sum of $20,000,000, and from the free milling ores taken from surface, to depth of 250 feet.

About the year 1849 these ores gave out completely at the above depth, and in a very sudden manner, most discouraging to every mine owner, so much so that the Government granted them leave to "disfrutar" or take out all the arches, or pillars, that the mining laws require to prevent the mines from caving in; this being only granted after the Government Mine Surveyors have officially notified that the mines have ceased to be productive.

Mr. John Sewell, an English gentleman, who had one of the above mines for some years, and having made a large fortune out of the same, was loth to abandon his mine, and determined to solve the mystery. He noticed not only the sudden disappearance of all trace of ore, but a sudden contraction of the vein, from 6 feet to about an inch, and in many places a thin cleavage of not more than ¼ of an inch. For two or three years he continued his explorations; levels, winzes, etc., were driven, but without success; not a trace of silver could be found in the pinched portion of the lode. At a later day the same applied to all the mines in the district.

Sinking was continued till they went through about 280 feet, nearly perpendicular, 832 being the underlie of the lode. At this period of the work Mr. Sewell was absent in Europe, which induced the manager of the mine to continue two months longer, awaiting Mr. Sewell's arrival to abandon the mine altogether.

Within the above short period the narrow cleavage of the lode changed suddenly again to the width of 6 feet as it had appeared before. This event took place in 1851, when the writer, took the management of the mine, continuing therein till 1857. The ores in this new strike changed completely, their composition being mostly ruby silver ores without any trace of the free milling. We have in Chile exactly the same change in copper mines from free smelting copper ores (carbonates and silicates) to sulphurets, under similar conditions of depth.

At the depth of about 600 feet, where the sudden expansion of the lode took place, the writer extracted nine and a half tons of native silver, which produced 90 per cent. of their weight in pure metal, on being melted down in the bar furnace. This kidney of native silver was surrounded by masses of pure ruby silver. Four hundred tons of this ore were shipped in 1851, in the brig Llewellyn, for sale in Swansea, Wales, and the average per ton was $2,000 or $8,000 in all.

Shipments from this district continued for about four years, and the calculations of the value of the ore shipped were about $25,000,000. Up to the year 1857 nothing was sent under 800 ozs. to the ton. This was produced in the second Bonanza in the stratified limestone formation, and "Believer in White Pine pockets" will, I fancy, be somewhat elated at these little pigney items, which may prove useful for future guidance in White Pine.

The sudden transformation from free milling ores to native and ruby silver at a depth of 600 feet induced mill owners to try all manner of experiments, as to roasting and chloridizing. They had graduates from Freiberg, as also practical men well versed in this branch of metallurgy; but all these failed, and in consequence all the ores were shipped to Swansea. It is evident then that these limestone formations created, among the Swansea smelters in Great Britain at that time a great reputation for richness.

The difficulty which arose in Chile in the chlorination of ores, may apply later on to the White Pine districts, when they will have attained the necessary depth, and begin to produce native and ruby silver ores. This difficulty was caused by the heavy percentage of lime in the ore—about 90 per cent—and the amount of salt and iron pyrites required for the complete saturation of the lime before the silver could be chloridized.

As stated above, the richer ores were shipped, and the writer solved the problem for the reduction of the poorer ores (of 200 ozs. to 300 ozs) on which the freight to Europe was too great for shipment. These were smelted in reverberatory furnaces with copper pyrites, and shipped as a *matte*—the former, with their lime, fluxing thoroughly with the quartz and pyrites of the copper. "Believer in White Pine Pockets" must not fear for the future results of the district he is advocating, provided competent practical men, well versed in these formations are consulted as to their peculiarities.

The diagram here shown will illustrate how *every mine* in the Chilian stratified limestone formations, especially in the district of Chañarcillo (where there are some forty odd mines on the *same* lode) were similarly affected by the adjacent stratified and unstratified rock—and at the *same* depth all throughout.

A^1 A^2 A^3 A^4 represents different periods of stratification; in many cases the strata itself is impregnated with chlorides of silver to a thickness of twenty or thirty feet, and dipping sometimes as little as 15 degrees. These latter are quarried out for their ores, on account of their great width, and as they deepen, stone arches are made to prevent the strata from caving together. In the several sections of stratified rock, the lode averaging from 4 to 12 feet in width, with great productiveness throughout every mine, each stratification averages about 300 feet in perpendicular thickness.

C, *C*, *C*, represent three sections of unstratified, hard, compact rock, same thickness as above, unproductive to even traces, throughout the forty odd claims, and pinched to from an inch to one-eighth of an inch in thickness. A remarkable fact was that to a depth of nearly 2,600 feet the fissure when reduced to a minimum thickness, varied hardly three degrees in its underlie. The contraction and expansion of the vein is shown in the perpendicular section at *F*.

E, *E*, *E*, represent the surface undulation. The whole section being divided up into forty mines; the size of each being 600 feet, or a total length of 24,000 feet. A^1 yielded free milling ores. A^2 native silver and ruby ores. A^3 sulphurets and antimonial ores, highly charged with iron pyrites.

As regards "Believer in White Pine pockets," reference to the Utah Silver Co. Limited, its management, peculiar formation, etc., I will reserve for a future article, at a more propitious moment in the welfare of such company. The causes of temporary failure and my conviction of its great success, if properly managed, as to adequate capital, smelting and mining operations. Suffice it to say that until Mr. J. R. Murphy took the management, recently, the greatest depth attained, and in ore from surface, was twenty feet. This will at any rate prove to the *believer*, etc. how some English companies are managed out here. At present, and only since the last two months, the developments in ore, all the way from surface in this company's mines, have only attained a depth of seventy feet, but nineteen feet wide of galena, of sixty-five per cent., and from eighteen to twenty-five ozs. in silver.

Salt Lake City, April, 1872.

Utah News.

Fifteen hundred tons of railroad iron are on the way from the East for the Utah Southern road. A large force of men are at work on the road day and night, and it will reach Utah Lake in about six weeks. From there it is expected a branch road will be completed by August, to the East Cañon and the American Fork mines——The total shipment for the past year from Salt Lake City was 10,800 tons of ore, and 2,370 tons of bullion——It is said that experts believe that in a few years Utah will supply, beside its silver product, all the lead required in the United States——Among the recent arrivals in Salt Lake City is a gentleman who acquired some mining interests there five years since, and which have during his absence developed to an estimated value of $2,000,000——The newly discovered placer diggings in Bingham cañon are yielding as high as 40 cents to the pan, and the common average, according to dispatches is $10 and $15 per day to the hand. Gold nuggets weiging as much as two ounces have been found there——Three new quartz mills and seven smelting furnaces have recently been contracted for to be built at an aggregate expense of a quarter of a million——A number of Eastern capitalists are in Salt Lake City on mining business——The crops throughout the Territory are reported in splendid condition, and there are no fears entertained concerning the grasshoppers——William Nixon, an agent for mining companies, had a difficulty with a miner named Harlow at Little Cottonwood on the 13th inst. which resulted in Nixon shooting Harlow through the heart——A vein of yellow chloride ore 10 feet thick, and worth $100 per ton is reported as having been struck in a mine at Little Cottonwood——Wells, Fargo & Co's agency have refused to give any further information concerning receipts or shipments of bullion, for publication.

Mining Sales.

The Lebanon quartz mine in Genesee valley, Plumas county, has been sold to San Francisco capitalists.

An English company have paid $1,000,000 for the Eureka, Seventy-Six and Rough and Ready mines, according to the Quincy *National*.

The Black Bear mine, in Klamath county, has been purchased by an English company.

The Dillon mine, in Rock Creek district, says the Placer *Herald*, has been sold for $2,800 to the Auburn mining company.

A Helena company have purchased an interest in the following mines, according to the Deer Lodge *Independent*, comprising in all 6,000 feet: Franklin, Stonewall Jackson, Plymouth, Silver Crown, Wyoming, Belle, Regina, Pride of Montana, Miller and Foster, Great Republic, Lilla, Bowling, Readout, Silver Queen and Poor. The mines are all at Philipsburg, Montana.

The Quincy *National* reports the sale of the Hungarian Hill Mining Co. to San Francisco capitalists for about $50,000. The Betterton mine near Mohawk valley, Plumas county, has been sold to Mr. H. C. Bidwell, of Greenville, and some San Francisco capitalists for $25,000.

The Eureka mining company have bought from C. Richardson and others the Mohile ledge which lies north of the Eureka. According to the Grass Valley *Union*, the amount paid was $6,000.

The Monitor and Independence mines, between the Arizona and El Dorado South, in the same vein, near Belmont, Nye county, Nevada, have been sold to San Francisco capitalists. The amount paid says the Reese River *Reveille*, is somewhere near $200,000. A large mill with all the modern improvements will shortly be built by the new owners.

The Quincy *National* says that the sales of mining property in Plumas county during the past three months have amounted to $1,235,000.

The Clipper mill, on Greenhorn creek, better known as the Mason & White property, has been sold for $6,000 to Miles Smart.

The Main lode, in Cherokee Gulch, above the Pelican lode, at Georgetown has been sold for about $100,000.

Domestic Economy.

Cooking Eggs.—It is understood that eggs are more easily digested if "rare" than "well done;" but which portion of the egg resiets digestion—the "White," which is nearly pure albumen, or the yolk? Lately, experiments have beeu made in this direction, with ample opportunity of demonstrating that healthy gastric juice, which the stomach secretes for purposes of digestion, will not act readily on firmly coagulated white of egg, even if cut in pieces not larger than ordinary peas (that is as fine as people usually chew their food !) while it acts with facility upon the more brittle yolk. The reason is that the coagulated albumen is very compact and teuacious, and would need to be "ground to powder" to accept the chemical affinities of the gastric juice. Pour into a basin boiling water sufficient to cover the eggs, put the eggs into the water and let them remain eight or ten minutes, according to circumstauces and your own taste; keep the water nearly up to boiling temperature, but don't boil the eggs. Old eggs will cook more quickly than fresh ones, and of course small ones quicker than large ones. By this process you will find the yolks well cooked, while the white is left in a condition to digest readily.—*Ex.*

Strawberry Syrup.—Take two pounds of nice ripe field berries, all the green ones being carefully picked ont, and put them without smashing into a large bottle with a wide mouth, and at the same time 2¼ pounds of finely pulverized white sugar. The bottle should not be quite full. They are left standing a few days at the ordinary temperature, being occasionally gently shaken up. The sugar takes up the liquid part of the berry, forming a clear, aromatic syrup, while the solid parts shrivel up almost odorless and tasteless, and may be easily separated from the juice by straiuing through a linen cloth. Milk or wine may be poured over the residue to make a palatable dish for the table. The above quantity of berries and sugar make 1¼ quarts of syrup. It may be kept for some time in closely stopped bottles in a cool place. It must not be heated, because the flavor of the berry is very volatile; a loug exposure of the juice to the air is also injurious. The syrup diluted with water makes an agreeable ice; or it may be mixed with some light wine as a drink. Raspberry syrup may be prepared in the same way. The flavor of the raspberry is not injured by heat, and the syrup may be more quickly prepared and with less sugar by placing the bottle a short time in boiling water. This syrup may also be used for ices. As a drink, when diluted with water, it is less piquant than that made iu the usual way by crushing the berries and letting the juice stand for a week.

Workingmen's Dinners. — The series of cheap, palatable workingmen's dinners lately inaugurated in London, have proved a great success. The repast consists of oxtail, mullagatawny, pea and gravy sonps made of Australian preserved meats; also legs of mutton, beef, vegetables, celery, etc. The hearty manner in which the meals are disposed of daily shows that the dinners are appreciated, and that the preserved meats are as agreeable as they are nutritious. The prices at which the dishes are served are extremely low, as will be seen from the following extract from the daily bill of fare: "Gravy soup, 1d. per plate; Irish stew, 2d.; stewed beef, 3d. The cheapness of the preserved meats enables those by whom the dinners were originated to more than pay expenses at the low prices charged. The best kind of benevolence is that which enables the poor to provide themselves with comforts, and if those who are desirous of doing good would try the experimemt of cheap dinners in this country, we think they would find the results gratifying.

How to Mix Mustarn.—Mustard should be mixed with water that has been boiled and allowed to cool; hot water destroys its essential properties, and raw, cold water might cause it to ferment. Put the mustard in a cup, with a small pinch of salt, and mix with it very gradually sufficient boiled water to make it drop from the spoon without beiug watery. Stir and mix well, and rub the lumps well dowu with the back of a spoon, as mustard properly mixed should be perfectly free from these. The mustard pot should not be more thau half full, or rather less, if it will not be used for a day or two, as the mustard is so much better when fresh made.

To Detect the Adulteration of Wines.—The adulteration of wines with cider can easily be detected by filtering and addiug ammonia in excess. The apple juice will immediately deposit crystals on the side of the test tube. Genuine wine sheds a pulverulent deposit which does not adhere to the glass, and is devoid of a crystalline structure. Acetic acid will dissolve either of these precipitates. The deposit from the cider consists of flat crystals with parallel sides; that from wine shows star-shaped formations. The treatment with acetic acid shows the presence of lime and phosphoric acid in both cases, the quantity of lime in the wine being minute.

Lemon Syrup.—When lemons are abundant and chesp, it is a good plan to purchsse several dozen at once, and prepsre them for use in the warm, weak days of spring and snmmer, when acids, especially citric and malic, or the acids of lemons and ripe fruits, are so grateful and so useful.

Press your hand upon the lemou and roll it back and forth briskly on the tsble to mske it squeeze more easily, then press the juice into a bowl or tumbler, never into tin; strain out all the seeds as they give a bsd tsste. Remove all the pulp from the peel and boil in water, a pint for a dozeu pulps, to extract the acid. A few minuets boiling is enough, then strain the water with the juice of the lemons, put a pound of white sugar to a pint of the juice; boil ten minutes, bottle it, and your lemonade is ready. Put a tsblespoonful or two of this lemou syrup in a glass of water, and you have a cooling, healthful drink.

Carbolic Toilet Water.—Crystallized csrbolic acid, 10 parts; essence of mille-fleurs, 1 part; tincture of quillaya ssponaris, 50 parts; wster, 1,000 parts. Mix. The sspoine replaces soap with advantage. The above should be employed, diluted with ten times its bulk of water, for disinfecting the skin, for washing the hands after any risk of contagion, etc.

The tincture of saponine in the ahove is made by taking of bark of quillaya saponsria, 1 part, snd of alcohol (90°), 4 parts. Heat to ebullition, and filter.

Cracked Wheat.—Immedistely sfter breskfast put a kettle of water to boil, with a steamer sbove, placing therein a two-quart tin vessel half full of cracked wheat, a tablespoonful of salt, snd water enough to cover. Allow it to stesm all day (with less time it tastes raw) add hot water occssionally, just enough to keep the cracked whest covered; it will swell double. Allow it to stand till cold, then turn it on a plate; serve at any meal, with cream and sugar. For the sake of hygiene I have, at every meal, cracked wheat, Graham, oatmeal or samp.—*Mono, Titusville, Pa.*

How to Cook Beets.—Beets are very nice cooked in the following manner: Slice cooked beets quite thin, put in a sauce-pan with some vinegar, water and a piece of butter, with sugar enough to make palatable. Any rule is impossible. Taste it, and if any ingredient is lacking, add more of it; salt a very little, and pepper; thicken the whole slightly; serve hot. Beets may be skinned much easier by rubbing over with a cloth immediately in taking them from the water in which they are cooked, thau by usiug a knife and fork.

Rice Pudning.—Try the following receipt: Take one teacupful of soft, boiled rice, one tablespoonful of butter, mixed in the rice while hot; add one quart of sweet milk, one teacup of sugar, the yolks of five eggs, season with lemon; bake until done. Beat the whites of five eggs to a stiff froth, and etir in it five heaping tablespoonfuls of powdered sugar; spread over the custard; return to the oven, and bake a delicate browu.—*T. W. C., Augusta, Ga.*

Cookino Raisins.—It is well to cook raisius before putting them iuto pies, cakes or puddings. Soaking them is not sufficient. Steaming them by pouring a small quantity of boiling water amongst them in a tightly closing dish, and allowing them plenty of time to cook before opening is a good plan. When raisins are rightly cooked before using they are plumper, and more palatable, and can he eaten without injury by most dyspeptics.

Graham Bread.—Stir into two quarts of blood-warm water enough Graham flour to make it about the consistency of pancakes; add half a pint of yeast and a tablespoonful of salt; allow it to stand all night in a warm place; early next morning add two cups of commou molasses and stir in enough flour to make about as thick as for cake—not good if too thick; at ten o'clock put into deep buttered tins (ahout four), set in a warm place to rise; in two hours it will be light enough. Bake one hour.

Orange Salad.—Peel eight oranges with a sharp knife, so as to remove every vestige of skin from them, core them as you would core apples, then cut them in slices, and lay them in a deep dish; strew over them plenty of powdered loaf-sugar, then add a large wineglassful of pale brandy; keep the dish covered close till the time of serving.

Lemon Butter.—One pound of white sngar, one quarter pound fresh butter, six eggs, juice and grated rind of three lemons, taking out all the seeds. Boil all together a few minutes, till thick as honey, stirring constantly; put in small jars or tumblers, covered with paper dipped in white of egg. One teaspoonful is euough for a tart or cheese-cake. This will keep a long time in a cool, dry place.

Chicken Cheese.—Boil two chickens till tender, take out all the bones and chop the meat fine, season to your taste with salt, pepper, and butter; pour in enough of the liquor they were boiled in to make it moist, put into whatever mould you wish, and when cold turn out and cut into slices.

Ginger Cookies.—Take three cups of molasses, one cup sugar, one cup hot water, oue cup butter, one tablespoonful ginger, two teaspoonsfuls saleratus; add flour enough, and knead them so that they will roll well, and they will be found good.

Salt Mines in Southern California.—The Los Angeles *News*, of April 21st, has the following mention of a California manufacture:

Southern California has but few manufacturing industries to boast of, but the few it has are, as a rule, paying enterprises. One of them is that of salt making. San Diego and Los Angles counties have each got works wherein the salt consumed in the Southern counties, Arizona and the Owens river country is manufactured. The article is obtained from the sea water by means of natural evaporation. The Pacific Salt Works, owned by J. B. Trudell, are located on the coast of the north side of San Pedro Point about ten miles north of Wilmington and seventeen miles southeast of this city. The sal tworks are located on a small lagoon, about 200 yards long by 50 broad, situated in a hollow, a quarter of a mile from where the surf breaks on the sandy beach. A ridge of sand hills protects it from the ocean wind and waves, while the rising ground inland affords it some shelter on that side. The mountain on San Pedro Point is an effectual barrier to the southernly gales which occasionally visit the coast. The lagoon is thus securely wind proof, and its placid surface is seldom ruffled by the slightest ripple. The lagoon is the source from which the water for salt is obtained. It is itself fed by springs of both fresh and salt water, some of them rising in its very center. The valley, or hollow, extends for nearly a mile, and two artificial ponds for salt making have been constructed at the south end of the lagoon, each being about 300 feet in length, 150 in breadth and a uniform depth of ten inches.

Quartz Mining.—We learn from parties interested in mining on the ridge, that very little is being done in quartz mining this season. The gravel mines are doing spendid throughout the whole county, but the quartz mining interest needs reviving. We are informed that there are a number of quartz ledges on Diamond creek which would pay handsomely if there was a mill haudy to crush the rock. A custom mill would do well there. The owners of these mines generally, are working men, without means enough to erect mills and machinery sufficient to work the ledges, consequently they have to lie idle. All that is needed to bring the quartz mining interest up, on the ridge, is capital. We hope ere long to hear of moneyed men taking hold of things in that direction.—*Gazette, Nev.*

Amono the Mormous busiuess is carried ou on the co-operative system and in the name of the Lord. "Holiness to the Lord, with an All-seeing eye is painted on their signs, which occasioned the remark from an Irish immigrant that there were a great many eye doctors there.

The richest sugar planter in Cuba is said to be Barros, who has 6 factories and an income of $4,000,000 per annum. Another planter, Poey, has a plantation, called Los Soanas, two leagues from Havana, with seveu hundred slaves.

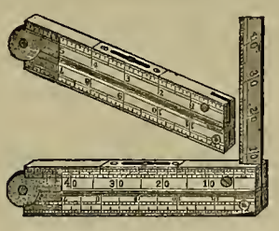
Catalogues sent on application.

A. CARR,
48 Cortlandt Street, New York.

AGENT WANTED for Pacific Slope. 7v23-1y-eow

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.



ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.

The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.

In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and NEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.

"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*

SHEET IRON PIPE.
THE
Risdon Iron and Locomotive Works
Corner Howard and Beale Streets,
Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.
All kinds of CAR WHEELS, AXLES and RAILROAD WORK made to order. Standard sizes of Wheels constantly on hand. Wheels bored and pressed on, Axles turned, etc., at Reasonable Rates.
☞ All kinds of Machinery made and repaired.
24v22-3m JOSEPH MOORE, Superintendent.

RICHARD H. STRETCH, Civil Engineer,
City and County Surveyor.
Office—Room 16, City Hall. 11v24-3m

Hydraulic Miners, Attention!

LITTLE GIANT.

If you wish to keep up with the times, buy a LITTLE GIANT or a DICTATOR. These are fully protected by Letters Patent, and Infringe on no others.

Manufactured of any size to suit. Are in use under all pressures, from 445 feet down.

WILL DISCHARGE FULLY TEN PER CENT. MORE WATER than any other, under the same circumstances.

An injunction from the U. S. District Court is now in force against HYDRAULIC CHIEF, and parties using the same will be duly prosecuted.

I fully guarantee my customers against all damages for alleged infringement.

Send for Particulars and Testimoniale

To WILLIAMSON & CORY, Marysville; J. H. NASH, Placerville; F. SMITH, at Locke & Montague's (San Francisco Agents); or to

R. HOSKIN, Dutch Flat, Cal.,

Sole Licensee and Manufacturer, under Allenwood's, Masey's, Rice's, Craig's, and Hoskin's Patents.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

THE TANITE COMPANY,
STROUDSBURG, PA.,
Sole Manufacturers of
THE TANITE EMERY WHEEL,
And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $118 each.

Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

U. S. Mining Laws.

From the Daily Alta, May 15th.

LAWS TO PROMOTE THE DEVELOPMENT OF THE MINING RESOURCES OF THE UNITED STATES.

SEC. 1. That all mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners, in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States.

SEC. 2. That mining claims upon veins or lodes of quartz or other rock in place bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits, heretofore located, shall be governed as to length along the vein or lode by the customs, regulations, and laws in force at the date of their location. A mining claim located after the passage of this act, whether located by one or more persons, may equal, but shall not exceed, fifteen hundred feet in length along the vein or lode; but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located. No claim shall extend more than three hundred feet on each side of the middle of the vein at the surface, nor shall any claim be limited by any mining regulation to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights existing at the passage of this act shall render such limitation necessary. The end lines of each claim shall be parallel to each other.

Sec. 3. That the locators of all mining locations heretofore made, or which shall hereafter be made, on any mineral vein, lode, or ledge, situated on the public domain, their heirs and assigns, where no adverse claim exists at the passage of this Act, so long as they comply with the laws of the United States, and with State, Territorial, and local regulations not in conflict with said laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes, and ledges throughout their entire depth, the top of apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of said surface locations: *Provided*, That their right of possession to such outside parts of said veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward as aforesaid, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of said veins or ledges: *And provided further*, That nothing in this section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another.

Sec. 4. That where a tunnel is run for the development of a vein or lode or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel, on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel, and while tha same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of said tunnel.

Sec. 5. That the miners of each mining district may make rules and regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located, by reference to some natural object or permanent monument as will identify the claim. On each claim located after the passage of this Act, and until a patent shall have been issued therefore, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the passage of this Act, ten dollars' worth of labor shall be performed or improvements made for each one hundred feet in length along the vein until a patent shall have been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim. And upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be open to re-location in the same manner as if no location of the same had ever been made: *Provided*, That the original locators, their heirs, assigns or legal representatives, have not resumed work upon the claim after such failure and before such location. Upon the failure of any one of several coöwners to contribute his proportion of the expenditures required by this Act, the coöwners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent coöwner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication, such delinquent should fail or refuse to contribute his proportion to comply with this Act, his interest in the claim shall become the property of his coöwners who have made the required expenditure.

Sec. 6. That a patent for any land claimed and located for valuable deposits may be obtained in the following manner: any person, association, or corporation authorized to locate a claim under this Act, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this Act, may file in the proper Land Office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States Surveyor-General, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted as aforesaid, and shall file a copy of said notice in such Land Office, and shall thereupon be entitled to a patent for said land, in the manner following: the register of the Land Office, upon the filing of such application, plat, field-notes, notices, and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to said claim and he shall also post such notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter within the sixty days of publication, shall file with the register a certificate of the United States Surveyor General that $500 worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during said period of publication. If no adverse claim shall have been filed with the Register and Receiver of the proper Land Office at the expiration of the sixty days of publication, it shall be assumed that the applicant is entitled to the patent, upon the payment to the proper officer of five dollars per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent shall be heard, except it be shown that the applicant has failed to comply with this Act.

Sec. 7. That where an adverse claim shall be filed during the period of publication, it shall be upon oath of the person or persons making the same, and shall show the nature, boundaries and extent of such adverse claim, and all proceedings, except the publication of notice and making and filing of the affidavit thereof, shall be stayed until the controversy shall have been settled or decided by a Court of competent jurisdiction, or the adverse claim waived. It shall be the duty of the adverse claimant, within thirty days after filing his claim, to commence proceedings in a Court of competent jurisdiction, to determine the question of the right of possession, and prosecute the same with reasonable diligence to final judgment; and a failure to do so shall be a waiver of his adverse claim. After such judgment shall have been rendered, the party entitled to the possession of the claim, or any portion thereof, may, without giving further notice, file a certified copy of the judgment roll with the Register of the Land Office, together with the certificate of the Surveyor-General, that the requisite amount of labor has been expended, or improvements made thereon, and the description required in other cases, and shall pay to the receiver five dollars per acre for his claim, together with the proper fees, whereupon the whole proceedings and the judgment roll shall be certified by the Register to the Commissioner of the General Land Office, and a patent shall issue thereon for the claim, or such portion thereof as the applicant shall appear, from the decision of the Court, to rightfully possess. If it shall appear from the decision of the Court that several parties are entitled to separate and different portions of the claim, each party may pay for his portion of the claim, with the proper fees, and file the certificate and description by the Surveyor-General, whereupon the Register shall certify the proceedings and judgment-roll to the Commissioner of the General Land Office, as in the preceding case, and patents shall issue to the several parties according to their respective rights. Proofs of citizenship under this Act, or the Acts of July 26th, 1866, and July 9th, 1870, in the case of an individual, may consist of his own affidavit thereof, and in case of an association of persons unincorporated, of the affidavit of their authorized agent, made on his own knowledge or upon information and belief, and in case of a corporation organized under the laws of the United States, or of any State or Territory of the United States, by the filing of a certified copy of their charter or certificate of incorporation; and nothing herein contained shall be construed to prevent the alienation of the title conveyed by a patent for a mining claim to any person whatever.

Sec. 8. That the description of vein or lode claims, upon surveyed lands, shall designate the location of the claim with reference to the lines of the public surveys, but need not conform therewith; but where a patent shall be issued as aforesaid for claims upon unsurveyed lands, the Surveyor-General, in extending the surveys, shall adjust tha same to the boundaries of such patented claim, according to the plat or description thereof, but so as in no case to interfere with or change the location of any such patented claim.

Sec. 9. That sections one, two, three, four and six of an Act entitled "An Act granting the right of way to ditch and canal owners over the public lands, and for other purposes," approved July 26, 1866, are hereby repealed, but such repeal shall not affect existing rights. Applications for patents for mining claims now pending may be prosecuted to a final decision in the General Land Office; but in such cases where adverse rights are not affected thereby, patents may issue in pursuance of the provisions of this Act; and all patents for mining claims heretofore issued under the Act of July 26, 1866, shall convey all the rights and privileges conferred by this Act where no adverse rights exist at the time of the passage of this Act.

Sec. 10. That tha Act entitled "An Act to amend an Act granting the right of way to ditch and canal owners over the public lands, and for other purposes," approved July 9th, 1870, shall be and remain in full force, except as to the proceedings to obtain a patent, which shall be similar to the proceedings prescribed by Sections six and seven of this Act for obtaining patents to vein or lode claims; but where said placer claims shall be upon surveyed lands, and conform to legal subdivisions, no further survey or plat shall be required. And all placer mining claims hereafter located shall conform as near as practicable with the United States system of public land surveys and the rectangular subdivisions of such surveys, and no such location shall include more than twenty acres for each individual claimant; and where placer claims cannot be conformed to legal subdivisions, survey and plat shall be made as on unsurveyed lands; *Provided*, That proceedings now pending may be prosecuted to their final determination under existing laws, but the provisions of this Act, when not in conflict with existing laws, shall apply to such cases: *Provided, also*, That where by the segregation of mineral lands in any legal subdivision a quantity of agricultural land less than forty acres remains, said fractional portion of agricultural land may be entered by any party qualified by law, for homestead or preëmption purposes.

Sec. 11. That where the same person, association or corporation is in possession of a placer claim, and also a vein or lode included within the boundaries thereof, application shall be made for a patent for the placer claim, with the statement that it includes such vein or lode, and in such case (subject to the provisions of this Act and the Act entitled "an Act to amend an Act granting the right of way to ditch and canal owners over the public lands, and for other purposes," approved July 9th, 1870) a patent shall issue for the placer claim, including such vein or lode, upon the payment of $5 per acre for such vein or lode claim, and 25 feet of surface on each side thereof. The remainder of the placer claim, or any placer claim not embracing any vein or lode claim, shall be paid for at the rate of $2 50 per acre, together with all costs of proceedings; and where a vein or lode, such as is described in the second section of this Act, is known to exist within the boundaries of a placer claim, an application for a patent for such placer claim which does not include an application for the vein or lode claim shall be construed as a conclusive declaration that the claimant of the placer claim has no right of possession of the vein or lode claim; but where the existence of a vein or lode in a placer claim is not known, a patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof.

Sec. 12. That the Surveyor-General of the United States may appoint in each land district containing mineral lands as many competent surveyors as shall apply for appointment to survey mining claims. The expenses of the survey of vein or lode claims, and the survey and subdivision of placer claims into smaller quantities than one hundred and sixty acres, together with the cost of publication of notices, shall be paid by the applicants, and they shall be at liberty to obtain the same at the most reasonable rates, and they shall also be at liberty to employ any United States Deputy Surveyor to make the survey. The Commissioner of the General Land Office shall also have power to establish the maximum charges for surveys and publication of notices under this Act; and, in case of excessive charges for publication, he may designate any newspaper published in a land district where mines are situated for the publication of mining notices in such district, and fix the rates to be charged by such paper; and, to the end that the Commissioner may be fully informed on the subject, each applicant shall file with the Register a sworn statement of all charges and fees paid by said applicant for publication and surveys, together with all fees and money paid the Register and the Receiver of the Land Office, which statement shall be transmitted, with the other papers in the case, to the Commissioner of the General Land Office. The fees of the Register and the Receiver shall be five dollars each for filing and acting upon each application for patent or adverse claim filed, and they shall be allowed the amount fixed by law for reducing testimony to writing, when done in the Land Office, such fees and allowances to be paid by the respective parties; and no other fees shall be charged by them in such cases. Nothing in this Act shall be construed to enlarge or affect the rights of either party in regard to any property in controversy at the time of the passage of this Act, or of the Act entitled "An Act granting the right of way to ditch and canal owners over the public lands, and for other purposes," approved July 26, 1866, nor shall this Act affect any right acquired under said Act; and nothing in this Act shall be construed to repeal, impair or in any way affect the provisions of the Act entitled "An Act granting to A. Sutro the right of way and other privileges to aid in the construction of a draining and exploring tunnel to the Comstock lode, in the State of Nevada," approved July 25, 1866.

Sec. 13. That all affidavits required to be made under this Act, or the Act of which it is amendatory, may be verified before any officer authorized to administer oaths within the land district where the claims may be situated, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, shall have the same force and effect as if taken before the Register and the Receiver of the Land Office. In case of contest as to the mineral or agricultural character of land, the testimony and proofs may be taken as herein provided on personal notice of at least ten days to the opposing party; or if said party cannot be found, then by publication of at least once a week for thirty days in a newspaper, to be designated by the Register of the Land Office as published nearest to the location of such land, and the Register shall require proof that such notice has been given.

Sec. 14. That where two or more veins intersect or cross each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection: *Provided, however*, That the subsequent location shall have the right of way through said space of intersection for the purposes of the convenient working of the said mine: *And, provided also*, That where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection.

Sec. 15. That where non-mineral land not contiguous to the vein or lode is used or occupied by the proprietor of such vein or lode for mining or milling purposes, such non-adjacent surface ground may be embraced and included in an application for a patent for such vein or lode, and the same may be patented therewith, subject to the same preliminary requirements as to survey and notice as are applicable under this Act to veins or ledges: *Provided*, That no location hereafter made of such nonadjacent land shall exceed five acres, and payment for the same must be made at the same rate as fixed by this Act for the superficies of the lode. The owner of a quartz-mill or reduction-works, not owning a mine in connection therewith, may also receive a patent for his mill-site, as provided in this section.

Sec. 16. That all Acts and parts of Acts inconsistent herewith are hereby repealed: *Provided*, That nothing contained in this Act shall be construed to impair, in any way, rights or interests in mining property acquired under existing laws.

[Approved May 11, 1872.]

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

COLUMBIA SMELTINO AND M. Co.—May 9. Location: San Diego county. Capital stock, $5,000,000, in 50,000 shares. Trustees—W. Meeks, J. W. Tripp, John Whalen, D. Fredemich, G. Ivancovich, H. Coward, R. Tiernan.

HEYDEN HILL M. Co.—May 9. Location: Heyden Hill M. District, Lassen county. Capital stock, $5,000,000, in 50,000 shares. Trustees—A. W. Blair, Samuel Fair, George M. Pinney, S. A. Raymond, H. S. Brown.

EUROPA M. Co.—May 9. Location: Gold Hill Mining district. Capital stock, $2,000,-000, in 20,0000 shares. Trustees — H. C. Wheeler J. H. H. Williams, C. H. Kingsley, O. Coats and S. K. Thornton.

MARION S. M. Co.—May 9. Location: Lincoln district, Nevada. Capital stock, $3,000,-000, in 30,000 shares. Trustees—M. J. McDonald, B. E. Connor, Charles M. Leavy, C. F. Hamilton, and George W. Blake.

MOJAVE CONSOLIDATED M. Co.—May 9. Location: Wallapai M. district, Mojave county, Arizona. Capital Stock, $3,000,000 in 30,000 shares. Trustees—M. G. Gillett. F. G. Berry, R. Denoon, C. P. Hall and Richard Wheeler.

PACIFIC CORDAGE Co.—May 9. Object: the manufacture of Cordage of all descriptions. Capital stock, 200,000, in 200 shares. Trustees—John Parrott, Oliver Eldridge, James Otis, Jabez Howes and J. D. Farwell.

PACIFIC COÖPERATIVE FURNITURE FACTORY.—May 10. Object: manufacture furniture. Capital stock, $100,000, with the right to increase the same to $250,000. Trustees—W. C. Powell, G. W. Dent, F. De St. Germain, W. Henry, F. O'Neill, Jacob Strahle and J. Rolland.

NATIONAL M. Co.—May 10. Location: Bristol district, Nye county, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—J. B. Haggan, Julius Ordway, Joseph Clarke, J. S. Doe and B. B. Minor.

FANSHAW CREEK IRRIGATION AND CANAL Co.—May 10. Object: To supply a canal already constructed in Fresno county, with water from Fanshaw creek, to be used for irrigating and many acturing purposes. Capital stock, $100,-000, in $10,000 shares. Trustees—F. C. de Wolt, Edward B. Perrin and Robert Perrin.

COLUMBIA M. Co.—May 11. Location: Virginia M. district, Storey county. Capital stock, $1,000,000, in 40,000 shares. Trustees—R. H. Graves, John Mallon, F. S. Weinsinger, E. Patten and M. D. Townsend.

CHAPMAN No. 2 S. M. Co.—May 11. Location: Ely M. District. Capital stock, $3,-000,000, in shares of $100 each. Trustees—J. B. Higgin, H. C. Kibhe, Charles E. Elliott, John P. Jones and J. S. Wall.

HOWARN M. Co.—May 11. Location: American Flat, Gold Hill District. Capital stock, $4,-800,000, in shares of $100. Trustees—George D. Roberts, John A. Stanly, G. D. Hall, H. C. Howard and James Lincoln.

CEDERBERG FIRST NORTHERLY EXTENSION G. M. Co.—May 11. Location: Greenwood M. District, El Dorado county. Capital stock, $2,400,000, in shares of $100. Trustees—A. J. Morrill, G. A. Hunter, W. A. Buckman, G. A. Cederberg, G. W. Simpers and G. W. Johnson.

HUNGARIAN M. Co.—May 11. Object: Gravel mining business. Capital stock $1,000,000, in shares of $50 each. Trustees—Clinton Gurnee, John D. Goodwin, Gcorge Hearst, Geo W. Bearer and Wm. Bollenger.

GREAT BLUE GRAVEL RANGE M. Co.—May 11. Location: Placer county. Capital stock, $5,-000,000, in shares of $100 each. Trustees—Wm. Higby, Winslow Hale, C. H. Dewey, E. S. Peck and J. M. Thompson.

RED JACKET G. AND S. M. Co.—May 11. Location: Gold Hill. Capital stock, $5,200,000, in shares of $100 each. Trustees—George D. Roberts, John A. Stanley, G. D. Hall, H. C. Howard and Jonas Lincoln.

ECONOMICAL GAS MACHINE Co.—May 11. Object: The manufacture and sale of carburetors for air and gas, under the letters patent issued by the United States. Capital stock, $10,000, in shares of $20 each. Trustees—Louis Marks, Rudolph Wichelhausen, Louis Porep, H. Burkheim and H. A. Seigfried.

DUNDERBERG M. AND M. Co.—May 14. Location: Mono county, California. Capital stock $5,000,000, in $5,000 shares. Trustees—J. P. Tones, A. H. Rose, Geo. Munckton, E. B. Rail and O. H. Boyd.

THE BAR ASSOCIATION OF SAN FRANCISCO.—May 14. Trustees—John W. Dwinelle, Henry H. Haight, Joseph W. Winans, W. W. Cope, Thomas I. Bergin. Joseph P. Hoge, President of the Association, is, by virtue of the constitution and hy-laws adopted April 27th, ex-officio a member of the Board.

The following companies have filed certificates of Incorporation at the office of the Secretary of State, Sacramento:

SOMERSET M. Co.—Location: Grass Valley District, Nevada county. Capital stock,$1,200,-000.

NORTH COMSTOCK G. & S. Co.—Location: Truckee Mining District, Storey county, Nev. Capital stock,$200,000.

AMAZON S. M. Co.—Location: Ely Mining District, Lincoln county, Nev. Capital stock, $3,000,000.

SWANSEA M. Co.—Location: Kelsey Mining District, El Dorado county. Capital stock, $3,-600,000.

ORIGINAL GOLN HILL G. & S. M. Co.—Location: Gold Hill, Nevada. Capital stock, $3,-000,000.

PROVIDENCE G. & S M. Co.—Location: California. Capital stock, $3,000,000.

BISMARK S. M. Co.—Location: Humboldt county, Nev. Capital stock, $5,000,000.

IMPORTANT MINING BOOK.

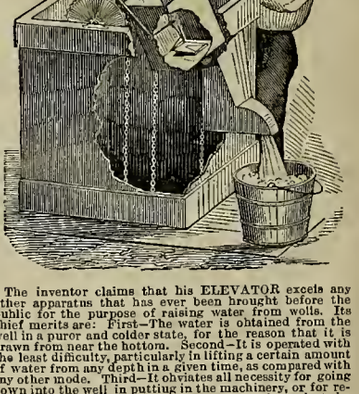
Mines, Mills, and Furnaces of the Pacific Statea and Territoriee; An Account of the Condition, Reeources, and Methode of the Mining and Metallurgical Industry in those Regions, Chiefly Relating to the Precioue Metals. By Roesiter W. Raymond, Ph. D., Vice-President Am. Inat. of Mining Engineers; Editor "Engineering and Mining Journal." Author of "Mines of the West," "American Mines and Mining," etc. J. B. Ford & Co., 1 vol. 8vo. 468 pp. Ex-Cloth. Sold by DEWEY & Co., publishers Scientific Press, San Francieco, at publishers' rates, $3.50.

Thie volume will ecarcely need to he recommended to those who are acquainted with the "Mineeof the West," "American Minea and Mining," and other profeeional publicatione of ita author. The preeent work ia in no eenae a repetition of Mr. Raymond'e former onee. It contains a full and comprehensive account of the condition of the gold and eilver mining industry of tha United Statea, with practical recommendstione of great importance to those engaged in it. The chapter on tha treatment of auriferous orea in Colorado ie the heat account of the stamp-mill procesa ever published in thie country; and the general diecuesion of smelting processes for silver oree supplies an instant want. The eeriee of volumee, of which thie forme the third, which have proceeded from the rapid but careful pen of Commissioner Raymond, are recognized in thie country and in Europe as profeeeionally authoritative and popularly interesting to a remarkable degree. To he techuically accurate, but not technically abstruse, ia their salient and acknowledged merit.

Endless Chain Elevator,

FOR RAISING WATER FROM WELLS.

BALL & CRARY, Patentees.



The inventor claims that his ELEVATOR excels any other apparatus that has ever been brought before the public for the purpose of raising water from wells. Its chief merits are: First—The water is obtained from the well in a purer and colder state, for the reason that it is drawn from near the bottom. Second—It is operated with the least difficulty, particularly in lifting a certain amount of water from any depth in a given time, as compared with any other mode. Third—It obviates all necessity for going down into the well in putting in the machinery, or for repairing the same, as such labor can be performed at the surface. Fourth—It can be easily taken out of one well and transferred to another. Fifth—It is less liable to get out of repair—but when repairs are necessary they can be easily made by any one; the action made by the Endless Chain and buckets keeps the well properly ventilated; there is no possibility for the person operating it [nor for a child] to fall into the well.

For circulars and particulars address

JOHN A. BALL,
20v24awhplm Grass Valley, Nevada Co., Cal.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Ingomar Silver Mining Company.—Location of Works: Ely Mining District, Lincoln County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the second day of April, 1872, the several amounts set opposite the names of the respective Shareholders as follows:

Names.	No. Certificate.	No. Shares.	Am't.

And in accordance with law, and an order of the Board of Trustees, made on the second day of April, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, Room 21, Hayward's Building, 419 California street, on Friday, the thirty-first day of May, 1872, at the hour of one o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

CHAS. S. NEAL, Secretary.

Office, Room No 2, Hayward's Building, 419 California street, San Francisco, California.

Stockholders' Meeting.—A meeting of the Stockholders of the Silver Cord Mining Company, San Francisco, Cal., will be held at the office of the company, 418 California street, on Monday, the 27th day of May, 1872, at 3 o'clock, for the election of Trustees for the ensuing year, and for the transaction of any other general business.

W. J. WILLIAMS, Secretary.
m18-2t Per order of the President.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are recognized as the perfected regulator. They are manufactured by Messrs. Gordon & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enterinto a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects sought to be utilized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of Steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co, Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK OF FINISHED Governor is desired. *,*THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

Alleghany Consolidated Gold Mining Company—Location of works, Alleghany, Sierra County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of April, 1872, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, 37 New Merchants' Exchange, California street. Any stock on which said assessment shall remain unpaid on the third day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, No. 37 (third floor), New Merchants' Exchange, California street, San Francisco. ma4-1t

Eagle Quicksilver Mining Company---Location of works, Santa Barbara County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 8th day of May, 1872, an assessment of $40 per share was levied upon the mines of said company, payable immediately in gold coin of the United States, to the Secretary at his office, room 5, No. 302 Montgomery street, San Francisco, California.

Any shares upon which said assessment shall remain unpaid, on Thursday, July 11th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, July 13th, 1872, for sale at public auction, unless payment shall be made before, will be sold on Monday, the 15th day of July, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office—Room 5, No. 302 Montgomery street, San Francisco California. ma.11.

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

M., to take into consideration and decide upon the propesition to increase the capital stock of said Company from one hundred fifty-three thousand and five hundred dollars, divided into six hundred and fourteen shares of two hundred fifty dollars each, the present capital of the Company, to three millions of dollars, to be divided into thirty thousand shares of one hundred dollars each.

J. TH. HELMKEN,
J. F. EGGERS,
JACOB HAHN,
F. SCHUMACHER. } Trustees.

Tecumseh Gold, Silver and Copper Mining Company.—Location of works, Gopher District, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1872, an assessment of Five ($5.00) dollars per Share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, F. J. Herrmann, at the office of the company, No. 634 Washington street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 29th day of May, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 17th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. J. HERRMANN, Secretary.
Office, 634 Washington street, San Francisco, Cal. Office hours from 11 A. M. to 2 P. M. ma4-4t

Union Gold Mining Company.---Location of works, Howland Flat, Sierra county, State of California.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment (No. 5) levied on the 11th day of April, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. shares.	Amount.
Mahoney, Denis	45	100	$100.00
Mahoney, Denis	47	50	50.00
Mahoney, Denis	62	75	75.00
Mahoney, Denis	63	100	100.00
Austin A. G	65	15	15.00
Hale, William F	129	50	60.00

And in accordance with law, and an order of the Board of Trustees, made on the 11th day of April, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, Room No. 22, Merchants' Exchange Building, California street, San Francisco, California, on Monday the 3d day of June, 1872, at the hour of 1 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ALFRED K. DURBROW Secretary.
Office—Room No. 22, Merchants' Exchange Building, California street, San Francisco, California. myl9-4t

Washington Mining Company---Location of works and mines, Mariposa County, State of Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of May, 1872, an assessment of $3 per share was levied up the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary at the office of the company, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 11th day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 29th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ma11-4 T. B. WINGARD, Secretary.
Office—Room No. 1, second floor of No. 318 California street, San Francisco. ma.11-4

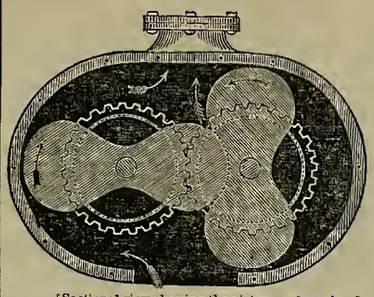
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

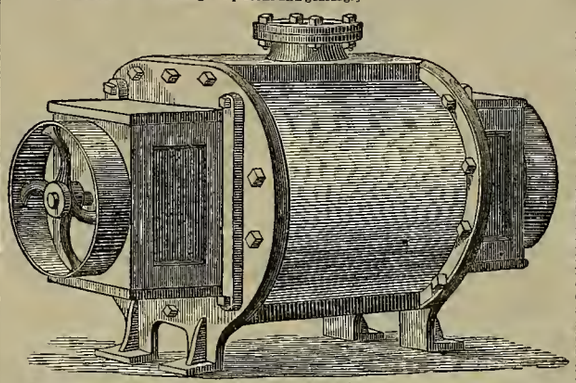
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may he seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gonld & Curry and Savage S. M. Co.'e, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchesers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of thegenuine article. **Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.**

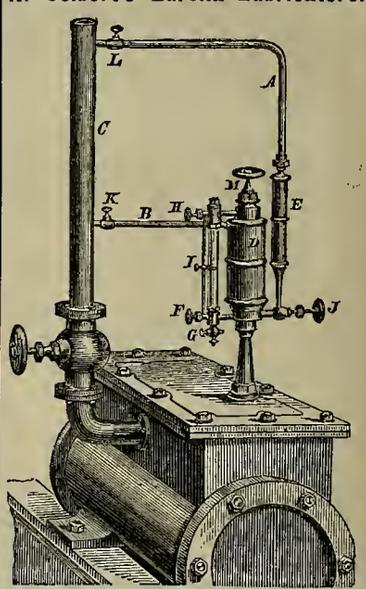
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged hy all engineers to he superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under tho oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tuhe I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured hy California Brass Works, 125 First street, S. F. 24v23tf

---

Notice is hereby given, that the copartnership heretofore existing hetween A. J. Severance, Charles W. Randall and J. Gus. Burt, nnder the firm name of "Severance, Holt & Co.," is this day dissolved hy mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as hefore, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.

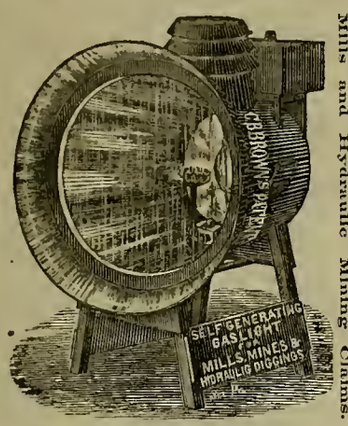
BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

For further particulars address

C. B. BROWN,
7v24-t Placerville, Cal.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco.

DEWEY & CO'S
Scientific Press Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.

PACIFIC RURAL PRESS—Agricultural.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Engraving on Wood, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

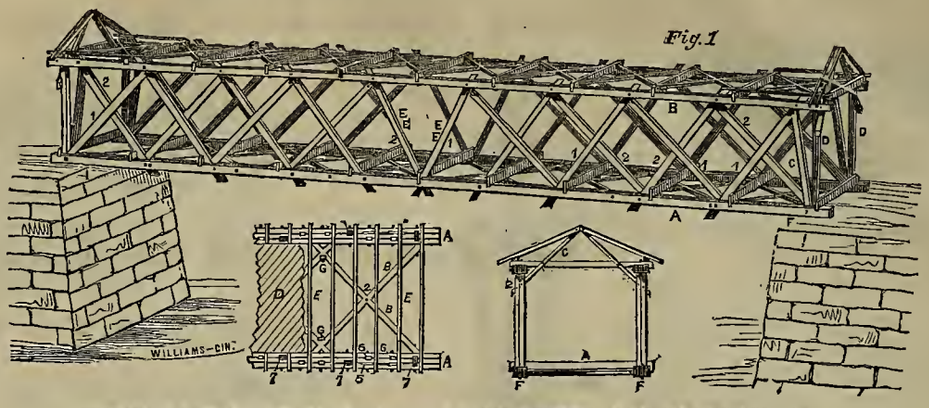
Office Desks and Book Cases
On hand and Manufactured to Order, by
JOHNSON & BEST,
No. 311 Pine street, opposite the Pacific Bank,
18v24-6m San Francisco.

PACIFIC BRIDGE COMPANY,



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable Length of Span.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular
GIANT POWDER, A NO. 2 GIANT POWDER,
Somewhat slower in its Explosion, which we recommend for
BANK BLASTING, COAL MINES,
AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

THE FREAR STONE COMPANY
OF CALIFORNIA.
Office, 638 Market Street.

OFFICERS:
James Gamble, President. | L. A. Booth, Treasurer.
EXECUTIVE COMMITTEE:
N. W. Spaulding George C. Potter, N. P. Perine.

This Company will contract to furnish or put up the heaviest, strongest and most elaborate and elegant Fire-proof Stone Fronts, of any design, and every style of Plain and Ornamental Door and Window Caps, Keystones, Sills, Water Tables, Coping Ashlars, Plain and Ornamental Stone Work of every description. Fire-proof Buildings and Bank Vaults, Cemetery Work, Curbing Stones, Fountains, etc., all at prices far below native cut stone, and equal, in all respects, as to strength and durability.

Architects and Builders, before letting their contracts for Stone Work, are requested to call at the office of this Company, and examine certificates, specimens and photographs of buildings already constructed of Frear Stone in Chicago and other Eastern cities.

For further information apply to N. P. PERINE, 638 Market street. [19v24-3m

SAN FRANCISCO, SATURDAY, MAY 25, 1872.

VOLUME XXIV. Number 21.

Whelpley & Storer's Pulverizing Mill.

A few weeks ago we called the attention of our readers to this invention and promised to give a full description and illustration at some future time. This we are pleased to do in the present issue.

The machine is, as its name denotes, for the purpose of pulverizing all materials that are capable of such reduction, and its range is very great, operating with equal facilities upon quartz and all other ores, foundry facings, salt, paints, cement, manganese, bone dust, drugs, chemicals, and spices. It has been thoroughly tested in the Eastern States, where its merits are beginning to be recognized, and after some delay the agent of Messrs. Whelpley & Storer (Mr. G. D. Wyman), has erected works in this city upon Main street, between Howard and Folsom, where the machines are running constantly and our statements can be verified. The cut shows the upper half of cylinder thrown back to show the revolving paddles and the fan. The ore or other material is first broken by a machine so that it will pass through a screen, the meshes of which are about one inch. It is then fed into a hopper at the right, and by an automatic and easily regulated feed is delivered into the drum, where it is caught and instantly reduced to a powder, the fineness of which depends upon the amount of air admitted with it, and consequently upon the draft by which it is carried through the machine. The fan is situated upon the same shaft with the paddles, and at the end opposite the feed opening, and it discharges the powder through a pipe into a dust room.

The machine as it is described consists of three parts or elements. The *first* is an automatic feed which furnishes a regular and constant supply of the material to be pulverized.

The *second* is a series of paddles revolving in an iron drum or cylinder, and generating vortices of air which reduce gravel or sand into dust, by causing a mutual attrition of particles.

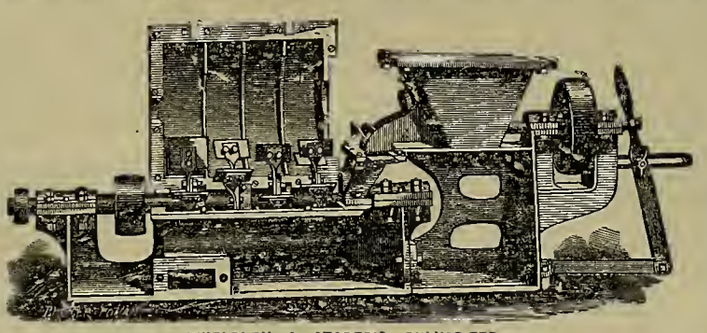
The *third* is the fan-blower, which is the continuation of the pulverizing cylinder, and separated from the pulverizing chamber by a diaphragm with central opening, through which the dust is drawn from it by exhaust as fast as it is produced.

For most applications it is necessary to have a chamber, or series of chambers or hoppers, to receive and collect the dust produced by the pulverizer. These are variously constructed, to suit the nature of the material which is to be reduced, and the conditions under which it is to be collected.

Pressure of air upon the interior of the dust room, and consequent back pressure upon the column issuing from the pulverizer, is prevented by a pipe leading from the extremity of the chamber back to an opening in the pulverizer, close to its feed hopper, thus inducing a constant circulation of the air.

How the Work is Done.

The mere statement of the facts in the case at first appears singular. Had any person, who never saw or heard of this contrivance before, been asked to give his opinion as to what could be the result of feeding ore into such an apparatus, he surely would not have predicted the results actually obtained. It would have been natural to expect a little splintering of the ore, and the speedy clogging of the pulverizing chamber, or perhaps the destruction of the whole machine in its efforts to clear itself of its contents. But as the truth is quite otherwise, we may well ask by what kind of action is the ore reduced to powder? *It is not ground*, for the machine *is expressly constructed to avoid a grinding action*, the paddles being in no case nearer to the walls of the cylindrical shell than half an inch; and the ore does not seem to be comminuted altogether by splintering against the iron surfaces, for although such action undoubtedly takes place at first impact, yet when it has reached a certain stage, and that by no means near the ultimate one, it cannot seemingly continue to any material extent. The only explanation occurring here, and that not at all satisfactory, is, that in the powerful commotion produced by the swift rotation of the paddles, the particles clash fiercely together and triturate each other—a view confirmed in some measure by the appearance of the dust under the microscope.



WHELPLEY & STORER'S PULVERIZER.

But whatever the mode, it is certain that the ore is pulverized to an extreme degree, so that from the open end of the pipe it floats away in a dense cloud.

The function performed by this machine is a double one; it pulverizes the ore and delivers it without loss by a single and indivisible operation. This it will be seen is of vital importance. It would otherwise be useless for metallurgical operations.

The quantity of dust furnished by this machine depends upon its size, upon the degree of movement that is communicated to the air and material, and upon the amount of material which can be kept in movement at one and the same time.

The machine which we examined will yield from one, to one and a half tons of dust per hour, according to the character of the ore or material.

Power Required.

As there is never in the machine but a few pounds of ore, at any one time, the quantity of power required to keep the machine in motion at full velocity is but little—enough to overcome the friction of the journals, rigidity of belting, and the slight resistance of air in the cylinder.

The power used in running them is expended on the *work* of the machine.

Endurance of Wearing Parts.

The principal wear is upon the upper edge of the paddles which are made of chilled iron. When a set of paddles are worn nearly down to the bolt heads they are reversed, and used until the second edge is worn, when they must be replaced by a new set, which may be done by any ordinary mechanic, in an hour.

To convey to our readers some idea of the actual wear, it may be sufficient to state that the *small* machine of which we spoke in our former article, has been running in this city constantly, for the past *five months*, having pulverized during that time several hundred tons of different materials and has worn out but two sets of paddles the cost of which was one dollar and fifty cents per set.

Through the courtesy of Mr. Wayman, we were invited to witness the different operations at the works, and the machines show a simplicity and completeness which promise them a wide field of usefulness in the future of our State for the purpose of ore reduction; while not the least of their merits is their adaptability to the feeding of fuel to the furnaces. For this purpose any coal screenings may be employed and these are reduced to a powder by the pulverizer, and this powder is lead directly into the furnace together with air enough for a most perfect combustion, thus doing away with most of the dirt, and ashes, while the amount of steam carried can be minutely regulated.

PATENT DECISION.—Our readers will recollect that a few months ago we published the decision of the Board of Examiners in full, in reference to the case of Overend vs. Dunn—an interference between the parties on certain claims for a type-casting machine. From that decision Dunn appealed to the Commissioner of Patents who has affirmed the decision of the Board of Appeal. This virtually settles the matter in favor of Mr. Overend who will now receive his patent.

The San Francisco Microscopical Society.

This society held its regular semi-monthly meeting at the rooms, 649 Clay street, on the 17th inst. Dr. A Kellogg and N. G. W. Harford were elected associate members, and Joseph Beck, of London, the celebrated manufacturer of microscopes, and Dr. Harkness, of Sacramento, were elected corresponding members. Mr. Attwood exhibited a number of specimens, among them, sections of porphyritic rock from the Sutro Tunnel; a piece of ore from the deepest shaft near Virginia, taken out by the Diamond Drill; a section of metamorphic slate from Shady Run, near Dutch Flat. A specimen of encysted hydatids was sent to the Society for examination.

Mr. Hanks showed a small piece of meteoric iron found in El Dorado County, by H. G. Freeman. Under the microscope the specimen, which had been subjected to the action of nitric acid, showed the usual characteristics of meteoric iron. Mr. Hanks also exhibited some of the residue which was left after treating it with nitro-hydrochloric acid; it showed both schreibersite and silica. Dr. Stout exhibited the crystallization of the chloride of gold and a set of fine French slides. Dr. Kellogg gave to the Society a twig of laurel bawthorne, the leaves and stems of which were covered with a peculiar "scale insect" and which he stated are propagated to apple and other fruit trees, seriously injuring them. This was a very interesting object. The new certificates of membership were exhibited and accepted by the Society. They are very neat and simple, and unlike such things usually are, are printed in plain type with no extra flourishes. The Society is getting on finely, and are evidently causing already an increased interest in this useful and interesting branch of science. The names of officers for this year we gave in a recent issue.

LONE PINE.—Dispatches from Los Angeles state that the earthquake shocks in the vicinity of Lone Pine still continue, and that a number of old craters are emitting steam and hot gases. One 15 miles northeast of Little Lake sends forth a column of steam incessantly. Professor Whitney, of the State Geological Survey, who is at present in that neighborhood investigating the causes and effects of the late great shocks, will have a fine opportunity of experiencing their effects at least, and will doubtless give us his experience as to the accompanying explosions, etc.

THE VIENNA EXPOSITION.—Congress has authorized the President to appoint one or more Commissioners on the part of the Government of the United States to the International Exposition to be held in Vienna in 1873.

MCCONES' Foundry, at Silver City, Nevada, was destroyed by fire last week; loss $150,000.

CORRESPONDENCE.

Ophir District, Utah.

Eds. Press:—Some time ago I promised to give you a letter touching on the mines of thie district; hut perhaps for no very exensible reason, I have deferred it until the present time. I will give you eome facts relative to the mines now being worked

On Lion Hill.

The Tiger, euperintended by Mr. Daly, is employing 18 men. The ledge is eaid to be improving; it has heen drifted in various directions and shows a heavy body of valuable ore. The Lion, Mr. Smith, Superintendent, is being worked by only a few men at present. Three shafts have been sunk on this mine, and drifts rnn. The ore has the reputation of averaging the highest of any in the camp. The Silver Exchange, Mr. Mills, Superintendent, is yielding very rich ore. The Sunnyside, Capt. Pierson, Superintendent, ehows a better body of ore now than ever before. The Virginia, Mr. Gray, Superintendent, is employing but four men just now. The Lizzie owners are waiting for the enow-water to dry from the shaft, when it is to be worked. This mine is down 47 feet, and has two drifts of 15 and 20 feet respectively; it has a perpendicular granite wall, and I should say three feet of good ore. The Hawkeye tunnel has got in about 300 feet, the design being to tap the large body of ore which is eupposed to be the feeder to the Lion.

On Silver Hill

We first come to the Peoria, now being worked by ite owners. This is across the gulch and south from the Lion, and shows a good hody of medium grade ore. Aro und to the south side of the hill are the Little Pem and Mary Francis, from both of which ore is being extracted that will aesay far up into the thousands. But few mines on this hill are being worked at the present time.

On Chloride Hill

The San Joaquin is being worked. Just above it a ledge of soft, rich yellow ore hae recently been uncovered, and ie now fast heing filled into sacks. Next ahove is the Carthagenia; the ore in sight is very rich hut limited in quantity. Next, the Jas. Fisk Co. are sinking down and leaving the ore on the wall. Next ahove is the Chloride Gem, Mr. Bradley, foreman. This has recently hecome the property of our local English Co., and from all appearances will prove a remunerative mine, as its ore is rich and a large body is in sight. The Los Angeles, lately opened, presents a flattering appearance. All of the ahove mentioned mines rnn on the same parallel, and are a similar character of ore. The Annie is yielding a first class ore, assaying $140, and there is a plenty of it in sight. The Gray and Ward Beecher are being worked. The Sphynx is being worked, and, it is said, turning out to the eatisfaction of the owners. The Cricket is looking well. These two mines are the property of the Egyptian M. Co. The Potosi M. Co. are rnnning a 35-foot level from their 70-foot shaft on the Chrysopolis. The ore is rich in quality but not in quantity. Below this is the "Strnck It," in 50 feet, and on which they have sunk 35 feot. This is nine feet between walls, but a "horse" fills over six feet of it. They think they will be under the horse eoon; and, judging from the rich stains now coming out, I should say they were about getting pay. Below the San Juan, on Office Hill, ie tho Live Yankee, a lead with two walls seven feet apart, presenting a good appearance.

The Velocipede, Shield, and Miners' Delight mines, Mr. Willard, foreman, are being worked by the English Co., some 15 men being employed. A vast amount of ore ie being taken out, and the mines are said to be improving. On the easterly elope of

Treasure Hill

ie the McCullum mine, owned by Messre. Tiernan & Haswell, which has been looked upon as worthless; but these men were persistent—and, not unlike the discoverers of the thin seam leading to the Emma, were indomitable—and their assiduity is being rewarded. Mr. Haswell, took it upon himeelf to euperintend the mine, and a sharp incline of 140 ft. hae beeu driven through solid lime-rock and they now behold what may prove a second Emma. The Fairview (a little east) has three inclines, one heing 73ft.; this mine continues to yield a good quality and quantity of oro. A little distance north is the Poorman, with a 30 ft. incline; this is qnite an encouraging prospect. Close by ie the California, with a 50 ft. ehaft. Up the hill, north from the McCullum, is a splendid mine called the Red Pine, which has a sharp incline of nearly 50 ft. and 20 tons of good ore on the dump. All of the last mentioned minee, with the exception of the English Co's. carry smelting ore. At the top of the hill ie the famous Hidden Treasure mine, Mr. Smiley, Superintendent. In consequence of litigation this is being worked by a few men only; all are aware however that this is a very massive deposit. Below the Hidden Treasnre is the Chicago, a fine large mine with a 60 ft. tunnel. About 200 ft. west is a solid body of galena filling a cut 10 ft. high by 6 ft. wide. On the west elope and on the

Dry Canon Side

Of the hill is the Fourth of July, owned by Jacobs & Co., T. Mack, Foreman. This mine has an incline tuunel of eighty feet; coming back within twenty-five feet of the mouth they have drifted off, in ore, some 128 feet. On the dnmp are about 300 tons of ore, and the Company are about constructing a tramway down into Dry Cañon. Near by are a number of promising prospects. On

Snow Storm Hill,

Is the Calcutta, in twenty feet, ehowing a fine hody of ore. Lawrence Bros. have several claims here, one of which ie in ahout 100 feet, and has ahout seventy-five tons of ore out. Tho Mountain Chief hae heen nncovered to some extent and presents a large face of ore. Snow Storm tunnel is idle.

Shoo Fly Hill

Is attracting considerable attention, the Alahama and Kearsarge having become the most noted; the former, including the Iris, is eupposed to be a very valuable mine. The Jennio may prove a far better mine, as it is extending its jaws, and how much of the other interests it may swallow, I would not like to predict; in fact, it is a first class mine now.

Mr. Jones is superintending the Rip Van Winkle mines, and is employing eighteen men.

The future prospects of this district are favorable, although the two mills, and two of the smelters, are closed down. Four of the arastras are in operation aud doing good work. Miners are in demand, and have been for several days. I have made mention of most of the mines with which I am acquainted, but owing to the usnal crowded state of the Press, I have made *mention* only. Ludlow.

Gold vs. Silver Mining.

Eds. Press:—Years of close investigation has convinced me fully, that one of the greatest errors in mining ie, the idea that gold is so readily amalgamated, and silver so difficult, for, in the result, directly the opposite is the fact. Experience and statistics prove that a much higher percentage of silver is obtained than gold, and the eooner this fact is admitted and acted upon, the sooner will our gold mines receive their just rewards, and the fewer will be the failures. Gold of gravity enough to deposit itself is saved—but what becomes of the millions of atoms as fine and finer than flour, which really make up the great wealth of all of our gold-bearing lodes. Were the silver miner to be as careful of his chlorides—were he, in fact, to show such utter disregard for the fine metal, as is displayed by our gold miners, ruination would be the inevitable result.

One reason why the perceutage of metal eaved in silver mining is greater, is, that the idea that gold is so "readily amalgamated" has caused a system of carelessnese and wastefulnese and has drawn into the pnrsuit, too often, inexperienced men; while the idea, that silver is eo difficult, has called for more skillful manipulatione. To save an eqnal percentage, as much care is required in one as the other. California gold miners must imagine that the law of gravity is overcome in this special branch of mining—that gold must deposit itself, in spite of a sluice head of water and is therefore "readily amalgamated." But the law holds good, to the eorrow, too often, of the miner.

Gold mining in California can be made as inviting and profitable, to capital and labor, as silver mining in Nevada or eleewhere; but to do it they have got to stop this hurrying businese and get a proper percentage of the metal.

Almarin B. Paul.

San Francisco.

Mines at Alder Gulch, Montana.

Editors Press: Snmmer has at last opened with us, and in taking a etroll np the far-famed Alder gulch, I thought a few mining items from there might be interesting to you.

Flumes and Ditches.

The first thing attracting attention iu ascending the gulch is the drain ditch of A. M. Hart & Co., just above town. They have been over a year, with four men, in putting it to bed-rook, hut now have it about completed, and will shortly commence taking out eome big pay. Next above is the drain of Mat. Roberts & Co., who will probably not get bed-rock before next July; it will then be 1,300 feet long, and from all reports they have plenty of good ground.

Then comos A. M. Conghill, who is hydraulicing on the Belgium bar, and will, judging from last year's clean-up, gather enough of the golden sands to make any one man happy.

At Parker & Co.'s Flume they aro making preparations for a hard eummer's work, in preparing side ditches and putting in new riffles, and will be in readiness for the miner's festival—"High water."

The Highland Flume Company are getting everything in good ehape, and intend doing big work, if one may judge by the preparations they are making, repairing side ditches, putting np hydraulics, etc. A part of tho company are drifting, and have been all winter, bnt with what sncess I do not know.

Fred. Gage & Co. have some as good ground as there is left on the gnlch. They took out about $5,000 with two men last summer, and intend, they say, doubling the amount this eummer. I do not think they have set it too high.

On onr way we called at Captain Southmaydes, who showed us his late work, which wae putting in a hed-rock flume in winter. They have run a tunnel some 500 feet, and set the finme in it. They are now sinking a shaft at the head of it, which they will ground-eluice down. It has often oocnrred to me that this is the proper way to put in bed-rock flumos, particularly in this gnlch, where our season is limited, both to time and water.

Gravel Mines.

Above them is Schenk, Rossiter & Co., who have everything in shape, anxiously awaiting the coming of the water. Their ground paye well—two or three ounces to the hand on bed rock—and this season they thiuk they have better ground than ever before.

A. C. Hall was the firet man in 1866 to take any money out of the gulch by fluming. Last year he put in a second flume and worked off considerable gronnd with, as he eays, flattering reeults. Hemust have had good ground, I jndge, from the fact of hie having bought out his partner, and paying $17,000 for the undivided one-half of 1,800 feet or thereaboute. Work with him, has hardly as yet commenced, for winter has not let up its grip. Summer does not commence there nntil about the first of June, and the working seasons, including Sundays, only average about 125 days.

Ahove this claim Tim. Rush & Co., and Reed & Co. are drifting and taking out dirt for snmmer washing, with good prospecte.

The Harris boys are etill working in Eagle hill, and piling up the dirt for summer washing, and I expect we shall hear of some big clean-ups, and nuggets the size of eggs by and by, as that ground has been famous for chispas of no ordinary size.

Quartz Claims.

John How is still working away upon the Oro Cache, and with good reeults. Ed. Covely is taking rock out of the Keystone that he will have crnshed as eoon as the roads are in condition for hauling it to the mill, bnt I apprehend that Col. Postlewaithe nearly cleaned that bunch out.

Geo. Batee & Co. have done well in working some ground upon the Oro Cache the past winter, and have considerable rock on the dumps. They have assorted their rock and a conciderable of it has run as high ae $100 per ton.

A Suggestion.

In concluding my remarks upon quartz, permit me to offer an improvement upon Profeesor Hank's method of separating the iron chips from the dies and ehoes that are gathered in the amalgam from cleaning up the hattery in quartz mills. In a paper published some two months ago in the Soientifio Press he mentioned floating it off as the hest means to he adopted. I think a magnet is the quickeet and moet practical way of removing it, or rather, that is the method ueed here.

In conclusion of this long letter, one word about our chances for water. I am happy to eay they are favorable. There is more enow at the head of thie gulch than has ever been there since the advent of the whites. The letters of yonr traveling correspondent, Murray, are highly appreciated here. Rough Diamond.

From Our Correspondent—L. P. Mc.

Schell Creek Mines.

Eds. Press:—As many of yonr readere may not know the exact locality of the above named mines, I will state that they lie 75 miles east of Hamilton, White Pine, on the edge of White Pine County, Nevada, and about the eame distauce south of Battle Monntain Station on the Central Pacific R. R.

Col. O'Connor Sidney, of London, hae pnrchased and taken posseesion of the Silver Wreath and the McMahon minee, and is pntting on a large force of men. The Colonel is a pioneer quartz miner of this coaet, and hae the confidence of nearly all the heavy capitalists in London. From his well known energy we may look for lively times in that district during tho coming eeason.

White Pine District.

This district has beon really in the background for some time, and for no apparent reason, other than that a largo majority of its dividend-paying mines are in the hands of English capitalists; and as their principal offices are in London, but little is known to us of the amounts of bullion taken out, although the English papers contain full reports of meetings, eto. I think that from the fact of some of the heavy San Francisco capitalists having been chosen as Trustees of some of the mining companies in this district, you will hear of more extensive developments and livelier times shortly, as the followiug will show:

The Trustees of the Original Hidden Treasure mine are: Alvinza Hayward, W. B. Bourne, R. Sherwood, Jos. De la Montanya, J. H. Crocker, S. Pinkham and Walter Laidlaw. The Suporintendent is Capt. Wm. Boyle, one of the oldest and most successful miners in that section of country—holding the position of Superintendent, in addition to the above, of the San Juan Del Rio, a very promising mine, the Pennsylvania, and two others. The enow has nearly disappeared, the roads are open, and the mills will shortly (if they are not by the time this is in type) be running to their full capacity, thousands of tons of rock being now ready for crushing.

The Refuse of Grapes.—In Europo the refuse of grapes, from wine mannfacture is utilized in the following manner: The refuse is first buried in a trench, covered with boards, on which stonee are laid. After some time the must is taken up and treated with hoiling water, which extracts almost all the argol—crude tartar, which will not dissolve in wine—iu the must, the press cake is then dried and placed in the retort for gas making.

The gas evolved is eaid to give a higher illuminating power than ordinary coal gae, while the coke, quenched with water, may be used ae a coal for filtering or to prepare "Frankfort black." Tho water used for quenching the coke may be evaporated, and from it a good quality of potash obtained. To prepare the "Frankfort black" the coke is treated with cold concentrated hydrochloric acid, and then washed with water. The substances thus dissolved out of it form an exceedingly rich fertilizing material.

SCIENTIFIC PROGRESS.

Relations of Calorific Power of Combustibles to Composition.

During the last session of the New York Lyceum of Natural History, a discussion arose on the above subject, in which the present writer startled most of the members present by announcing his conviction of the total fallacy of the prevalent mode of calculating hypothetically the calorific value of a coal or other combustible, from its elementary constitution. He claimed that, in believing that the same elements in a complex mixture, as well as in a homogeneous compound, even when present in the same centesimal proportions, must needs give the same heat on complete combustion, we ignore all the well-founded and accepted views of molecular dynamics and thermo-chemistry. As the products of complete combustion of carbo-hydrogen materials were always molecularly identical—that is, carbonic acid and water—the materials themselves must have had identical molecular constitution originally, in order to exert the same amount of internal disturbance, while falling into the same new molecular arrangement. He cited many known facts to support his views, which gave rise to some discussion, and aroused especial opposition from the distinguished President of the Lyceum, Dr. Newberry, who remarked that if Professor Wurtz believed he could substantiate these revolutionary ideas, he should not pause, night or day, but devote himself exclusively to the task, the importance of the subject being unsurpassed by any other in the range of science!

With this preamble, we introduce the following extract from a report of a recent communication of Scheurer-Kestner and Meunier to the Academy of Sciences, on the Heat of Combustion of Lignites:

"Lignite, the authors found, is distinguished from coal also in this particular—that the later emits a far greater quantity of heat than that due to the combustion of its elements (carbon and hydrogen). Attention is again called to the fact that it is impossible to judge of the value of a fuel according to its elementary composition; all calculations based upon such data are quite fallacious, and the authors prove this conclusively by referring especially to one of the samples of lignite they investigated."—*American Gas-Light Journal.*

CARBONIZED SEWAGE.—Mr. Hickey is engaged in India, says *Engineering*, in testing the efficacy of his invention of preserving sewage by carbonization. The main features of Mr. Hickey's plan are that he collects the gases evolved during carbonization, which he proposes to make available for town illumination, while the coke which remains has been found to be a most excellent deodorizer, and, mixed with the ammoniacal liquors collected from the gas retorts, it also forms a valuable manure. The production of gas for lighting purposes by the carbonization of ordure is not a novelty, but dates as far back as 1686. But whether it will ever be found practicable to illuminate towns with gas produced from their sewers is very doubtful. Mr. Hickey's experiments show that gas and coke can easily be made by his process, but the pecuniary success of the manufacture is not yet settled. The gas has an illuminating power of only 2½ candles.

TRANSMITTED RADIANT HEAT.—The question whether equal areas at different points of the solar surface, transmit equal energy towards the earth has not been satisfactorily answered. The author of *Mechanique Celeste*, finding by observation that equal areas do not transmit equal energies (the central regions transmitting, in opposition to his reasoning, much greater intensity than those near the border) explains the matter by showing that the solar atmosphere retards the passage of the rays causing a great diminution of the energy of the radiant heat projected towards the earth. Capt. John Ericsson, in a series of ingenious experiments with incandescent spheres, described in full in *Engineering*, shows the inaccuracy of this theory.

FAT FOUND IN BEER YEAST.—In an article by Dr. Vogel, read before the Academy of Science, in Munich, after referring to the fact that all cereals contain a larger or smaller quantity of fatty matter, which is an essential constituent of the grain, the author describes at length his experiments made for the purpose of extracting, by the means of ether, the fat contained in beer yeast, an oil boiling at about 200° Centigrade, specific gravity equal to 0.901; decomposed when heated above 300° Centigrade, and yielding acrolein. The quantity of this oil found in one liter of the yeast amounts to from 0.2 to 0.3 drams. It appears that this oil is, in most respects, similar to the fatty matter in barley.

EFFECT OF EXTREME COLD ON SNOW.—Dr Kane, the arctic explorer, recorded the very striking and suggestive fact that snow, at a temperature of forty degrees below zero, F., loses much of its anti-fractional quality. He found it nearly as difficult to draw a sledge upon such snow as upon sand.

DISCOVERY OF A NEW PLANET.—Prof. James C. Watson, of Ann Arbor, Mich., writes to the *Journal of Science*, that he discovered a new planet, on the night of April 4th, in the constellation Virgo. The planet shines like a star of the eleventh magnitude.

PRESERVATION OF WOOD.—Gen. Haupt contributes to the May *Van Nostrand*, a review of the chief processes proposed for the preservation of wood, and adds some deductions of his own. From his experiments and investigations he concludes:

1. That so long as the cells of wood are occupied by air and moisture, no preservative solutions can be introduced, and the expulsion of air and moisture must be the first step in any effective process for preserving timber from decay.

2. That water can be expelled by a long continued application of heat, but air only by expansion in a vacuum, and the combination of heat and vacuum will secure the most rapid expansion of both water and air.

3. That the preservative fluid must be introduced while the cells are empty, consequently the process must be carried on in vacuo.

4. That no pressure, however great, applied externally to the surface of timber, can force any fluid into the interior so long as air or water is contained in the cells. When air alone is present there may be penetration to a limited extent superficially, but water is practically incompressible. If, however, the pressure is applied at one end only of a stick, as in the Boucherie process, a fluid may be forced through and exude from the other end.

GEOLOGICAL SUCCESS.—An instance of complete success in search founded on geological indications has just occurred in Sweden. An extensive coal bed of unusual depth in Europe, and of excellent quality, has been discovered at Raus, in Schonen, by boring on the strength of evidence afforded by the lithological formation existing there. At first the promises were not satisfactorily fulfilled. Eleven strata of coal, indeed, were pierced by going down 566 feet; but none of these were more than a foot or so in thickness. Five feet further a bed was penetrated over eight feet thick. Other borings prove the existence of coal of great extent. The shares of the company at once rose 700 per cent above their par value.—*Ex.*

PERUVIAN ANTIQUITIES.—The Geological museum of the University of Rome has received from King Victor Emanuel a magnificent collection of Peruvian antiquities, comprising a number of silver vases, some extremely curious musical instruments, a colored garment made from the bark of trees, and some arrows and lances. These last are notched, ornamented with feathers, and have wooden heads, showing that they belong to the period when the use of iron was unknown. The whole of these articles were found in a bed of guano, and evidently date from the earliest antiquity.

BOILER INCRUSTATION.—Experiments have been tried with favorable results, it is said, at Vienna on Bérenger's plan of treating feed water for boilers. The water is softened by a solution of lime and forced through a particular kind of filter, which retains the generated precipitate. There is no necessity for waiting for the settling of the precipitate. From 10 to 15 filters, each of 0.1 cubic metre capacity, soften about 410 cubic metres of water per day.

ART MONUMENTS.—M. Demetrio Salazaro, the Inspector of the National Museum, at Naples, is about to publish, in thirty parts, at fifteen shillings each, a series of photographs and chromo-lithographs of the Art Monuments of Southern Italy, from the fourth to the thirteenth century. This is the first great attempt of its kind, and is intended to show the growth and development of Italian art from its earliest rise.

THE vacancy at the British Geological Survey office, caused by the death of Sir Roderick I. Murchison, has been filled up by the appointment of Professor Andrew Cromhie Ramsay, L.L.D., F.R.S., as director-general. Professor Ramsay has for many years been director of the Geological Survey and Professor of Geology in the Royal School of Mines.

A REMARKABLE MINERAL.—A. Frenzel writes of a mineral, which forms in the winter in the Himmelfahrt mine at Freiberg, but vanishes in the spring, when the weather begins to grow warm, or damp, though it forms 334 metres below the surface. An analysis gave

Magnesia	16.53
Sulphuric acid	32.62
Water	50.81—99.96

THE Spectroscopic Association of Italy is the title of a new society, the main object of which will be "to enrich science, by the aid of the spectroscope, with new discoveries upon the physical constitution of the sun." The first number of the *Memoirs* of the Society has already been published.

XYLONITE, which is prepared by the action of nitric acid on woody fibre, is made into a sheeting or tissue impermeable to water, which may be used as a substitute for india-rubber in the manufacture of all water-proof articles.

REPEATED spectroscopic measurements made last year by Professors Zollner and Vogel, in Germany, show that the velocity of rotation of the sun on its own axis is at the rate of six hundred and sixty miles an hour.

CANE-SUGAR when exposed to light in sealed tubes is converted into grape-sugar or glucose. The solution should be as concentrated as possible.

MECHANICAL PROGRESS.

Economy of the Hot Blast.

The first practical application of the hot blast was made in 1828 or 1829 by J. B. Neilson, an Englishman. Mr. N. and his colleagues after determining the great value of the invention for smelting ores, expected to see it generally employed for all furnace operations; but the result has been that practically, it is almost exclusively confined to smelting the ores of iron.

The earliest carefully recorded experiments with the hot blast were made at the Clyde Iron works, with the following result:—

For the year	1829	1831	1833
Temperature of blast	Cold	458° F.	612° F.
Coal used per ton of iron	As coke.	As coke.	In raw state.
For fusion, cwt.	133	86	40
For heating air, raw coal	nil	5	8
For blowing engines, coal	20	7	11
	153	98	59
Cwt. limestone per ton of iron	10½	9	7

From this it would appear that heating the air with 5 cwt. of coal had saved 47 cwt. of fuel in the furnace, and 8 cwt. similarly applied had been followed with an economy of 93 cwt., or above 69 per cent.

Besides this advantage the make was increased by more than one-third, and a blowing engine, which only supplied three furnaces with cold blast, was equal to four when the air was heated.

The iron trade hesitated somewhat in crediting that the heat generated from 8 cwt. of fuel burnt outside the furnace, should be able to perform the duty of a very much larger weight burnt inside. Some writers on the metallurgy of iron, when speaking of the advantages of Neilson's system, have not perhaps been sufficiently careful in drawing a distinction between the saving directly due to its application and that arising in a collateral manner from its use. Looking at the question, however, in its commercial sense, the figures and language quoted from the work of Dufrenoy justified the character he gave to it.

Puddling Steel Rails.

The Flushing and North Side Railway Company with its leased roads will have laid, by the 1st of July next, 40 miles of steel track. The rails are of puddled steel, with partly iron flanges and vertically piled.

The advantages claimed for these rails are:—perfect safety against breaking, not a single rail of this kind having been broken during twelve years' use in Germany and four years use in this country, greater strength and endurance than can be obtained from steel-capped rails.

The value of the worn-out puddled-steel rails is higher in proportion to first cost than that of cast-steel rails, or iron rails with cast-steel caps, which cannot be re-rolled, but must be recast.

The only disadvantage of the puddled-steel rails is that a percentage of them may give out in the weld after a wear about equal to that of the life of three common iron rails. This is only a disadvantage in comparison to full steel or ingot rails, which have no welds, and therefore cannot fail in the same manner. Setting aside the greater safety of the welded steel rails, the question of economy in the use of either chiefly depends on their respective first cost, on their wearing qualities, and on their market value as scrap when worn out. The solution of this question will depend more or less on the individual experience of the consumers, especially of those who have tried the different kinds of steel rails.

RAILROAD IMPROVEMENT.—A Pennsylvania engineer, named Wilder, has recently hit upon an idea which, if carried out as it deserves to be, will do much toward increasing the efficiency and enhancing the economy of railroads. It provides for the laying of two narrow gauge tracks, side by side, with a space between the inner rails equal to the ordinary gauge of four feet eight inches. Thus three possible gauges will be furnished on the same line, all of which it is proposed to use. For freight, the narrow gauge will be used at a safe rate of speed, while for passenger travel, and a high rate of speed, the broad gauge will be used, the cars being mounted on four lines of wheels. This, he contends, will prevent oscillation, thereby increasing safety. He calculates by this system, and the increased weight of engines, it will permit of a rate of speed being attained as high as a hundred miles an hour.

No doubt a greatly increased speed may be attained by such a device, but when a train of cars is made to travel a hundred miles an hour, the material of which they are constructed and their manner of construction must be somewhat modified from their present material and form.

PUDDLING BY PETROLEUM.—It is asserted by the French technical journals that the experiment of using petroleum as fuel in the puddling furnace which has been in progress in a large iron producing establishment during the past three months, has proved itself to be very successful. In point of convenience, efficiency and in the superior quality of the iron produced, it is asserted that petroleum affords the best fuel that has yet been employed.

Burnt Iron and Steel.

W. M. Williams has given the result of some inquiries into the causes of this phenomenon, to the Chemical Society of London. After some remarks upon the physical characteristics of iron and steel so damaged, he asserts that he found in all the samples of burnt *iron* which he has subjected to examination, particles of black oxide more or less abundantly distributed throughout the mass. These are, however, absent in burnt *steel*. The method which he suggests of quickly detecting such damage, is to take a small quantity of fresh borings or filings from the subjected metal, cover them with diluted nitric acid. As the iron dissolves, the free oxide separates and remains suspended in the liquid, rendering it dark in color. These particles shortly disappear, and are thus to be distinguished from separated carbon. No such discoloration takes place with good iron.

The cause of the burning of iron he explains as follows: As soon as the small quantity of carbon is removed from the heated mass by oxidation, this process extends to the iron itself—not only upon the surface, but into the interior. The higher the temperature, and the longer the exposure, the greater is the quantity of carbon necessary to protect the iron. The best iron is that in which carbon is brought to the lowest possible proportion, without oxidation of the iron.

Burnt steel the author considers to be steel which has, by reheating, lost some of its carbon by oxidation, and by sudden solidification has had the resulting carbonic oxide imprisoned in the interior of its mass. The well known permeability of iron for certain gases renders such a process not difficult to understand.

The structure and properties of "burnt iron and steel," are therefore "caused by the presence of intermingled particles of combustion products breaking the continuity of the metal. The carbon is burnt in the case of the burnt steel, the iron itself in the burnt iron.

THE TURBINE PROPELLER.—As a gun recoils when fired, or as the progress of a rocket is kept up by the recoil arising from the efflux of the gases generated by the ignition of the composition with which the rocket is filled, so the progress of a vessel driven by the turbine propeller is kept up by the recoil arising from the efflux in a sternward direction of a stream of water, kept up by the action of a centrifugal pump or turbine, driven by a steam engine, drawing water from the sea and discharging it sternwards, in a continuous stream, through a bent pipe or nozzle, at a high velocity.

The turbine propeller was invented some years ago, and attracted sufficient attention to secure a competitive trial by the British Government in 1867, with screw propellers. Although the turbine did not equal (although not much behind) the screw, yet its performance at so early a stage cannot but be considered as very promising. Mr. A. Murray has lately brought up the subject again in the *Jour. R. U. S. I.*, and urges further trials and investigations. It is claimed that the turbine affords a higher per cent. of utilized power than the paddle or screw, which last, all admit, lose a large amount of power, say 40 to 50 percent. at least, while centrifugal pumps of 40 to 50 horse-power, for raising water, have been found to utilize even as high as 80 per cent., varying from that down to 50. But to determine this point satisfactorily further experiments are needed.

Other points of superiority over the screw or paddle wheel claimed for the turbine are: the power of rapidly stopping the way of a vessel; great power over a heavy leak; freedom from the chance of internal injury or of fouling; utility when the vessel is being driven by sails at the rate of 10 knots or more, (when the paddle or screw would be of little or no service,) thus obtaining a greater speed than ever yet realized on the ocean; assistance rendered to the vessel's steerage; not being affected by the pitching or rolling of the vessel; non-interference with any desired form of the ship for insuring good sailing properties; facility of bringing into action or discontinuing its use, etc.

PRESSURE IN STEAM BOILERS.—The question as to whether the pressure in a steam boiler was equal or different at top and bottom, concerning which their seems to be some difference of opinion amongst engineers—though it is difficult, from the simplicity of the facts involved in considering the question, to see how a difference of opinion should exist—has nevertheless been experimentally determined by the Messrs. Hunter, at their establishment in this city. An elbow was attached to the end of the blow-off pipe which entered the mud-drum; into this a plug was screwed, and tapped to receive a half-inch pipe; to this a steam gauge was attached and the cock opened. On comparing the indications of the gauges attached at top of boiler and to the top of drum, as above described, it was found that the pressure was greatest at the bottom, by a pound and a half, proving, as might readily have been predicted, that the pressure upon the bottom of a boiler is equal to the steam pressure indicated above, plus the weight of a water column equal in hight to the difference in level between drum and surface of water in boiler, and in diameter to that actually on the gauge.—*Jour. Franklin Institute.*

UP to 1870 there were seventeen steel works in Great Britain. There are now nine steel-rail mills in the United States, while two others are building at Chicago and Springfield, Ill., and four others are projected at St. Louis, Milwaukee, Omaha, and two on the line of the Pacific Railroad.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned

California.

ALPINE COUNTY.

M. & N. W. Co.—Alpine *Miner*, May 11th: The main tunnel is to be pushed with vigor.

NATIVE SILVER is reported as having been found in one of the drifts of the Schenectady yesterday.

ORE at several points in the M. & N.W. mines is looking well. No. 6 drift is looking better than for some time, and No. 7, just started, is already in ore.

AMADOR COUNTY.

KENNEDY.—Jackson *Dispatch*, May 18th: The prospects in this mine are more flattering than ever before.

RICH.—Jackson *Ledger*, May 18th: As work progresses in the Phœnix, the ledge increases in width until it has reached full 20 ft. in thickness, the whole body heing first class rock. Several thousand tons of valuahle rock is upon the dump, ready for milling.

BUTTE COUNTY.

BULL CREEK MINES.—Oroville *Record*, May 18th: The Cook Co. claim cleaned up last week, after a 4 days' run, and took out 19¼ oz. Four hands are employed, which would give $25 a day to each.

CALAVERAS COUNTY.

WEST POINT.—Calaveras *Chronicle*, May 18th: The 8 stamp mill on the Zacetara is running on some very rich rock from the mine.

Some rock from the Bartolo recently treated, yielded $64 per ton. The ledge is nearly 2½ ft. in width, and works easily.

In the Harris mine the new machinery has completely freed the mine from water, and the owners are heing rewarded hy some excellent rock.

The Steger mine has temporarily suspended operations, owing to an influx of water, at 60 ft.

In theWoodland, Mr. Wood proposes to open a second tunnel to intercept the ledge about 100 ft. helow the present one.

In the Ohio Con., work is heing pushed with vigor. The tunnel is in nearly 150 ft., and is designed to cut 3 very rich veins of quartz.

NEW QUARTZ MILL.—A new quartz mill has recently heen erected in the vicinity of Campo Seco for the purpose of prospecting some of the leads in that vicinity.

EL DORADO COUNTY.

LUCKY STRIKE.—Placerville *Republican*, May 16th: Two miners on the Diamond Springs divide, found a lump of gold worth ahout $2,000, last week.

INYO COUNTY.

BULLION.—Inyo *Independent*, May 11th, May 1st. Hiskey & Walker shipped 6,459 ozs., valued at $4,000.

CERRO GORDO.—The furnaces at Cerro Gordo and Swansea are in constant operation.

MONO COUNTY.

BENTON.—Inyo *Independent*, May 11 th: The foundations of the new 10-stamp mill are heing lain, and the work hids fair to he rapidly pushed to completion.

NAPA COUNTY.

QUICKSILVER.—Napa *Reporter*, May 18: The mines near Oakville, including the Whitton, are heing vigorously worked, and are yielding well.

COAL.—Woodland *Democrat*, May 11: Mr. Beuj. Ely, of Buckeye, is one of the propietors of a coal mine recently discovered 4¼ miles southeast of Knoxville, which promises to be a good thing. The vein was discovered by a Mr. Walton, and near the surface showed a seam less than an inch wide. At 8 ft. the vein is three 3 ft. thick and widening as it goes down.

NEVADA COUNTY.

STARTED.—Nevada *Transcript*, May 15: The Providence Co., on Deer creek, have got their mill in good running order, and commenced crushing yesterday. They have out between 250 and 300 tons of splendid quartz.

NORTH BLOOMFIELD G. M. Co.—They will commence immediately to sink 8 shafts, and will give employment to 150 additional men.

WILLOW VALLEY.—The Montana Co., are fitting up hoisting works and expect shortly to be in active operation.

The Buckeye Co., have out over 100 tons of quartz, and will commence hauling it on Monday to the Oriental mill to have it crushed. The rock shows considerable free gold and is rich in sulphurets.

GRANITEVILLE MINES.—The Erie is turning out splendid rock. The Amshaw has a fine looking ledge. A large numher of men were to work on this last week. The old Scotchmen's Tunnel cement diggings are to he opened np immediately. The Black & Young is taking out better rock than ever before. The gravel diggings are being worked extensively. The claims of Morris, Quinu and Mitchell, on the north fork of Poor man's Creek are turning ont fiuely.

MOUNT AUBURN.—Nevada *Gazette*, May 18: Hoisting works are heing erected on this mine, and will soon he completed, when work will be pushed forward.

FRENCH CORRAL.—The Big Slide Co. have erected a new quartz mill—10 stamps. Ahout 150 tons of good rock is heing crushed, and the mill is heing run night and day.

GOLDEN GATE LEDGE.—G. V. *Union*,May 15: The shaft is down ahout 130 ft. and at the hottom is a well defined ledge 2 ft. thick.

PICAYUNE CO.—The Co., working in gravel on Randolph Hill, has very fine prospects ahead. The gravel will pay from $10 to $12 a day to the hand for drifting.

PLUMAS COUNTY.

LARGE YIELD.—Quincy *National*, May 11: Ferguson & Wagner, of Dutch Hill, on the North Fork, recently shipped about $5,000, the result of their Spring's run.

GREEN MOUNTAIN.—Work at this mine, near Cherokee, is progressing finely. They have completed their raise up to the surface, and a shaft will be sunk immediately.

STRUCK IT.—Mr. Carman, who has an eastern extension on the Betterton ledge, near Mohawk Valley, has struck the ledge, and obtained some fine prospects.

SAN DIECO COUNTY.

THE MINES.—San Diego *Bulletin*, May 9th: The Golden Chariot Co., San Felipe Cañon, have out about 225 tons of ore, which they expect will yield about $30,000 with which they intend to put up a mill.

SAN BERNADINO COUNTY.

RICH.—Los Angeles *News*, May 11: 60 tons of ore from Chatfield & Knights mine, Clarke dist. yielded $1,600, per ton.

SIERRA COUNTY.

GOOD YIELD.—Downieville *Messenger*, May 11: A clean up in Henry Backer's claims at Eureka, resulted in nearly 200 oz. of fine looking gold.

GOOD HAUL.—100 oz. of gold was brought down the other day from Hughes diggings at Rattlesnake, picked up from the bedrock.

HIGH COMMISSION.—This mine continues to produce splendid rock.

LIVELY.—It is confidently anticipated that we shall have a large number of capitalists among us this Summer, looking for a chance to profitahly invest their means.

SISKIYOU COUNTY.

LITTLE HUMBUG.—Yreka *Union*, May 11th: Dad Rider and Commodore Jones are running 2 sluices in their claim and are realizing from $14 to $15 to the hand. Love & Shadreau's claim is paying from a half ounce to an ounce a day to the hand. The claim of Parker & Parson is yielding from $12 to $15 per day to the hand.

TRINITY COUNTY

THE BIG DITCH.—Weaverville *Journal*, May 18th: The prospects are decidedly favorable for the construction of the Steuart Fork Ditch this Summer.

TUOLUMNE COUNTY.

GRAVEL CLAIM.—Sonora *Independent*, May 18th: Mr. Richards has made the discovery that the sheep-pen, near the slaughter yard of Vickery & Goodwin, a short distance from Springfield, is on a rich deposit of auriferous gravel, and that the prospects are good.

DAVID HUGHES' TUNNEL.—This tunnel, located in Bald Mountain, is to be worked on the hack channel.

YUBA COUNTY.

BROWN'S VALLEY.—Marysville *Appeal*, May 17th: Considerable prospecting for quartz is going on in that vicinity. The Wisconsin Co., and Jeffard & Co., are husily engaged in prospecting for extensions to the old ledges.

Nevada.

EUREKA DISTRICT.

PHOENIX AND JACKSON.— Eureka *Sentinel*, May 14th: In the Phœnix operations in the main are confined to the Adams and Farren shaft. The machinery for the hoisting works, is all on the ground and rapidly heing put in place. The Adams & Farren shaft is down 350 feet. The ore has steadily improved iu width and richness from the surface. The Jackson has attained 110 feet. The shaft will he continued 40 feet deeper, when a drift will he started south for the ledge.

LEMON MILL.—Yesterday the Lemon Mill started up, the White furnace for some time under process of construction having been completed. The capacity of the mill, when all the stamps are in motion and hoth furnaces running, will he 20 tons per day.

FREIBERG.—A smeltiug furnace of 40 tons capacity has been erected and will soon he in successful operation. There are upwards of $1,500 tons of ore on the dnmp ready for use at the furnace.

NEWPORT.—The main shaft is down about 130 feet, at which point a cross drift is heing run. This drift has heen run east and west 32 ft in low grade ore the entire length. Greater depth, it is believed, will develop higher grade ore in immense qnantities. The work of sinking will he resumed as soon as the west wall of the ledge is reached with the drift.

STRIKE.—The owners of the Hannah, in New York Cañon, have struck water at 160 feet. This is an important i'em in the history of our dist., as it has always heen argued that in limestone formation water does not exist.

ELY DISTRICT.

LOCAL RECORD.—Ely *Record*, May 12:

BULLION.—During the past week W. F. & Co. shipped $141,063.94; the previous week the shipment was only $124,332. 70.

HUHN & HUNT. — Enough ore is in sight to warrant us in the assertion that from $250,000 to $300,000 worth could be taken ont in a very short time.

ELLEN GOODSPEED.—Assays from this mine run from $86 to $310 in silver. Assays from the Eliza Sutter nearly gave $125 in silver and $8 in gold.

CHIEF OF THE HILL.—Since our last mention the west winze has heen sunk 80 ft. from the first level, and shows 3½ ft. of good ore in the bottom. Assays of ore taken from 6 different places in the mine gave an average of $103.50.

CONDOR.—Work on the old shaft has been vigorously prosecuted, and a depth of over 100 feet has heen attained. Ahout 140 ft. below the old shaft, a new one, intended to he used as the main working shaft, has just heen started and is down 8 ft. The vein of ore in this shaft is already 18 inches in width, and looks extremely well.

MOCKING BIRD.—The shaft is down 12 ft., with the ledge the full size of shaft, 6x4¼. Average assays from the ore takeu out are $98.

ORLEANS.—Work was resumed on Friday last, and will be pushed vigorously ahead. The shaft has a depth of 65 ft., from which point a contract to sink and drift 100 ft. has been let.

SPRING MOUNTAIN TUNNEL.—The tnnnel is in 180 feet; ledges have heen cut in going ahead, one at 31 feet from the mouth and the other 143. At the point wherc the first ledge was struck a drift was run 16 ft and a chamher 14x12 was opened. Here a winze was sunk to 100 ft, on ledge matter all the way, and at 55 ft a large body of ore was struck into. The second ledge struck carries a fine body of ore in sight: assays from it have gone as high as $3,000.

HUMBOLDT.

BULLION.—Unionvillo *Silver State*, May 28th: Amount shipped from Arizona since our last issue, was $5,849.

REESE RIVER.

PROGRESS.—*Revielle*,May 11th: Mr. Wreu is working the Progress and has strnck a hody of rich chloride ore ahout 10 inches in width about 10 ft from the surface. The ledge is about two feet wide.

JEFFERSON CANON.—The incline upon the Sailor-hoy is down ahout 25 ft, all the way in porphyry. The ledge is ahout 4½ feet in width, ahout 18 inches of which is first-class ore. Assays taken promiscuously from the pile range from $1,000 to $1,500 per ton.

Two inclines are heing sunk on the Prussian Ledge one of which is down 20 and the other 15 feet.

The Rappahannock Ledge has heen stripped 100 ft showing a fine hody of ore all the way averaging 2½ ft in width.

A fine body of ore 2ft wide has heen struck at the 35 ft level in the Hillside.

Ahout 7 tons of ore that will work up iuto the thousands, has been taken from the Summit Ledge.

WASHOE.

BULLION.—Reno *Crescent*, May 11th: The shipment for the week ending May 10th was 18,317 pounds, from the Crown Point and Belcher mines principally.

LOCAL SUMMARY.—Gold Hill *News*, May 18th: Succor—New shaft down 68 ft. and very good progress heing made.

CROWN POINT.—Daily yield 580 tons, from the 1,100 and 1,200-ft. levels, where all the ore hreasts are looking splendidly. The amount of rich ore in sight is immense, with no definite houndaries or extent, but embracing the whole mine at the lowest depths.

BELCHER.—Daily yield, 300 tons, from the 1,100-ft level.

BUCKEYE.—Daily yield ahout 50 tons of good paying gold ore. Drifting both north and south is heing energetically carried forward. The south drift at the 100-ft. level is in excellent ore. The drift south at the 300-ft., or lowest level, has cut into a fine hody of ore.

SOUTH OVERMAN.—This Co. are about to commence sinking a new working shaft.

KENLUCK.—Daily yield increased to 49 and 50 tons per day. A 5-stamp mill in addition to the Devil's Gate mill has heen started, crushing ore from this mine.

CHOLLAR-POTOSI.—Daily yield ahont 200 tons. Average assays $40.

UTAH.—The work of sinking the new shaft is being continued night and day.

DANEY.—North drift at the 500-ft. level in 193 ft. on the vein, following excellent indications.

HALE & NORCROSS.—For the past week the average production of ore has been 120 tons.

YELLOW JACKET.—Daily yield 30 tons. The ore streak at the 1300 ft. level, near the Kentuck line, is of too low grade to be worth extracting.

CON. VIRGINIA.—On the 500-ft. level of the new shaft they are drifting sonth in the vein along the west wall.

IMPERIAL EMPIRE.—The rumored strikes of good ore in drifts from the shaft, so prevalent during the past few days have no foundation in fact.

SAVAGE.—Daily yield about 200 tons. Night before last the winze from the 1400-ft. level made connection with the main south drift of the 1500-ft. level, giving a fine circulation of pure air.

OPHIR.—The main drift west at the 1300-ft. level is discontinued and running north substituted with good progress and prospects. The main drift west will be resumed shortly. At the 1100-ft level the main drift west is in 383 ft., and the south drift 220 ft.

UNION CON. S. M. Co.—S. F. *Stock Report*, May 15: This mine is located in the Virginia Mining District. The incorporation consists in the consolidation of the United States M. Co's and the Union Co's ground, which embraces all the ground lying hetween the Ophir and the Sierra Nevada, including several parallel ledges east and west of the Comstock, amounting to about 12,000 ft. Mr. Lee, the Sup't of the Co., informs us that they have a shaft down 130 ft., and on a line and several hundred ft. north of the Ohir Co's new shaft. It is in three compartments and in good condition, which they intend to erect machinery on immediately, and continue sinking the shaft and develop their mines at a greater depth.

WHITE PINE.

EAST SHEBOYGAN.—W. P. *News*, May 11: There is a marked improvement in the appearance of the ore body in the different openings since last mentioned.

WARD BEECHER.—Making preparation to commence breasting out in the open cut. There are upward of 5,000 tons of fair milling ore in sight.

NORTH AURORA.—The ore body in Lady's Chamher has increased in qnantity and improved in grade since last noticed. The drift running south is pushed ahead rapidly, extracting 65 tons daily.

Arizona.

MINES AND MINING.—Prescott *Miner*, May 4th: At 90 ft. from the surface the El Pasco lode is thicker and richer than it has heen at any point in the shaft above that depth.

In Mohave Co. Mr. Coover's furnace is running, and it is thought that Mr. Elder's will he runuing by tho 10th of the month.

Colorado.

CARIBOU.—Central *Register*, May 1: The Eureka lode, 300 ft. south of the Caribou lode, bids fair to prove one of the best mines in the dist. At 18 ft. the owners are taking out silver glance which assays $2,756.75.

GIBSON GULCH.—Work is soou to he resnmed on the "Clifton." The "Veto" has been worked under lease, and a fine body of mineral has been raised. Ahout 50 tons of ore is on the dump, ready for shipment, supposed to be worth abont $200 per tou. Work is actively progressing on the Queen lode. Work will bo resumed on the Franklin lode, as soon as the Co's mill at Masonville is completed.

BOULDER.—Caribou *Post*, May 3: Tommy Scott has honded his interest in the Star of the West lode, in Suowy Range Dist., to St. Louis parties for $10,000.

Idaho.

LOCAL RECORD—IDA ELLMORE.—Owyhee *Avalanche*, May 4th: Tho 7th lovel drifts aro being run with energy.

MINNESOTA.—The shaft is down 230 ft. from the bottom of which 3d level drifts are running north and south. Thoy aro hoisting about 15 tons of ore daily, estimated to be worth from $40 to $50 per ton.

MAHOGANY.—45 miners are employed in this mine. They are down to the 5th level, a distance of about 425 ft. from the surface, and have drifted some 50 ft. each direction from the shaft. Stoping is going on between the 3d and 4th lovels, and the main drifts in the 4th lovel aro being run fast.

EMPIRE.—Thoy have only worked out a portion of the first lovel, tho ore of which yielded large profits, milling $154 per ton. They have about 50 tons ou the dump at the mine.

CATALOW & Co. intend to resume work on the Blue Jacket, on the hill east of town, in afew days.

Montana.

TRINITY.—Helena *Herald*, May 2d: Bob Steele has recently discovorod now placer diggings in Trinity gulch, which pay $8 per day to the hand.

"7-30 LODE."—This is the name of a very rich silver lode recently discovered on Clancy Creek. Mr. McMurphy showed us yesterday a fine silver button taken from an ounce of ore. The assayer says it will yield at this rate $600 por ton. A shaft of 35 ft. has been sunk and considerablo ore takon out. The vein is 10 inches wide.

UNIONVILLE.—Cor. same: The National Co. have struck excellent quartz in their new mine ou the Owyhee, and will put on additional men the first of next month. They are moving their hoisting works from the old mine to the new one, and are fitting up their mill ready for crushing.

The Columbia Co. are sinking on No. 3, Union East, and are down 200 ft.

At Grizzly, McGarity & Co. have a good body of quartz.

Constans is findiug good quartz in his lode.

"Norwegian Pete" is also taking out good rock from the discovery on the Evelyn lode.

The "Spanish Boys" are taking out rock on the Shaker, at the head of Nelson, which runs at the mill nearly $100 per ton.

Judge Turnley is running $30 rock at his mill, taken out of the Park lode.

The Harvey mill starts. up on Monday next, crushing quartz from Tucker Gulch and "float" rock from the Park.

QUARTZ GULCH.—Unionville *Pioneer*, April 27th: Mont & Tag, at the mouth of the gulch, oleaned up from their bedrock flume in 20 days' work, with 4 hands, $1,200. Loutzenheiser & Co. are doing remarkably well. Richards, Duboise & Silverson, on No. 18 in the upper dist., are cleaning up from $15 to $20 a day to the hand.

QUARTZ.—Virginia *Montanian*, May 2d: Mr. Poznainsky, on the True Silver in Brown's Gulch, has tapped a splendid body of ore with his tunnel.

John How, on the Oro Cache at Summit, keeps his force of hands busily taking out ore, while the mill is pounding away with good results.

Tom Harper and Dr. Ellis, from the Iron Rod and other leads at Silver Star, were in town Tuesday with 260 ounces of retort.

At Jefferson and Boulder there are over 50 discoveries being developed, and some 400 mbn are busily employed in quartz.

The furnace of Marsh & Starrett, of Jefferson, having already made two successful runs, started up a new charge Tuesday morning.

Utah.

BLACK JACK GULCH.—S. L. *Tribune*, May 11th: Parties are preparing to erect a 10-stamp mill at the junction of Black Jack and Butterfield cañons, and have already made a good road from the mines to the site.

STRIKE.—At 45 ft. a 10 ft. vein of yellow chloride ore was struck last Friday iu the Lexington mine, Little Cottonwood. The oro is worth $100 to the ton.

CAMP FLOYD.—Cor. same: The Sparrow Hawk mill, at the lower end of Lewiston, is nearly completed.

MINING SALES.—The Orleaus Company bave sold their quartz ledge at Gold Flat, Nevada County, to some San Francisco capitalists for $15,000.

Two important sales of mining property in Camp Floyd and Tintic districts took place on the 20th. One transaction amounts to $100,000 cash, and another to $400,000 in four monthly installments.

San Francisco Stock and Exchange Board.

THURSDAY, MAY 22.

Tho sales at the Stock Board for the week ending May 15th, were $4,617,900, and make a total since January of $106,294,000. Tbo *Bulletin*, in a tabulated statement for eacb week, sums up as follows: Week ending January 10, $3,000,000; week ending Jan. 17, $3,482,500; week ending Jan. 24, $4,540,200; week ending Jan. 31, $4,208,600; week ending Feb. 7, $8,015,000; week ending Feb. 14, $7,682,900; week ending Feb. 21, $4,950,000; week endiug Feb. 28, $3,377,000; week ending Mar. 6, $3,867,600; week ending Mar. 13, $4,072,300; week ending Mareh 20, $4,309,000; week ending Mar. 27, $4,014,700; week ending April 3, $4,308,000; week ending April 10, $7,183,700; week ending April 17, $8,494,400; week ending April 24, $11,203,300; week ending May 1, $8,579,900; week ending May 8, $6,357,200; week ending May 15, $4,617,900; total, $106,244,800. These figures show an averago of $5,500,000 per week, or $286,000 per annum. Prior to last year the heaviest sales at the Board were in 1868, wbon they amounted to about $116,000,000. The sales for 1869 were $69,000,000, and for $1870 were only $51,000,000. Tho monthly averago this year bas been about $23,000,000.

The stock market has fluctuated considerably during the week, and Monday they fell heavily. Everbody was anxions to sell and nobody to buy. The whole amount of business done on that day was very small and a very general decline of prices occurred. On Friday the 17th the market was irregular but some kinds advanced a little. On Saturday stocks received a heavy blow, and everything fell considerably. Monday was worse still and the expected reaction did not occur. Tuesday morning it was weak and some kinds were lower than they have been for four or five months, but they rallied at the afternoon session. On Wednesa general advance was experienced although at the afternoon session prices were lower than in the morning. The sales this morning showed an advance in prices over last evening hut were irregular.

Tbe new shares of the Crown Point Co. are ready for distribution. The Company has filed a certificate of increase of capital stock from $10,000,000 on 100,000 shares. The amount of stock paid in is $3,000,000, and there are no debts against the Company. The Best and Belcher Company have increased their capital from $448,000 tq $2,240,000. The Consolidated Virginia have increased their capital stock from $5,800,000 in 11,600 shares to $7,080,000 in shares of $300 eacb. The Pocahontas Company will meet June 28 to consider a proposition to increase their stock from $120,000 to $1,200,000. The Buckeye Mine produced last week 150 tons of ore, averaging $16.22, and the Chollar-Potosi 1,055 tons, averaging $34 28. Th latter shipped $16,300. The Raymond & Ely Mine has sent down on May account $198,940. The Hale & Norcross took out last week 875 tons of ore and there are on the dumps 2,685 tons. The Savage took out last week 1,180 tons, assaying $27.80 per ton. The Eureka Consolidated Mine produced last week 1,100 tons of ore. The bullion product of the mine for the month thus far is 432,795 lbs and they have 1,035 tons of ore on hand. The yield of the Crown Point last week amounted to 3,000 tons of ore, valued at $111,000. The Meadow Valley Mine has sent down on this month's account $58,600.

MINING ACCIDENTS.—A miner working in the Caledonia shaft was very severely injured, on the 16th inst., while endeavoring to lower a cage wheel which had stuck in the main shaft. The *Territorial Enterprise* says that the cage generally used was broken, and an old one which did not fit was put in its place. Thirty feet from the bottom it stuck fast and considerable cable was paid out on the roof. The miner went down to loosen it and instead of having the slack cable raised jumped on the cage, which gave way and fell with him to the bottom of the shaft. His right arm was broken, he received a severe cut on the head, and one eye was badly injured.

The Pioche *Record* says that Jacob Ackerly, employed by the Meadow Valley Co., jumped from a ladder on to some picks, which he had previously thrown into the drift, and ran the point of one into his foot, inflicting a painful wound.

Joseph Purdy was caved on in the claim of Holman & Co., accordiug to the Weaverville *Journal* of the 18th, hut was dug out without serious injury.

IN Wurttemberg, in a triangular section of land, with corners at Rottenburg, Göppingen and Gundelsheim, there are three million fruit trees in 1,050 square miles (English). With a population of 430 persons to the mile, there comes 6¼ trees per head, with an average yield of nearly three hundred weight of fruit.

Pacific Coast Products, and Their Future Market.

[By Prof. E. S. Carr—Written specially for the Pacific Coast Mercantile Director.]

California, with but little more than 500,000 inhabitants, or one and one-half per cent. of the National population, ranking in this respect as the twenty-fourth State in the Union, in the amount paid to the support of the government as *income tax*, ranks as the fourth. The assessed value of property owned in 1870, was: real estate, $176,527,180; personal, $93-116,908. Total, $269,644,088. On an actual value of $394,517,784 real, $234-270,233 personal, or a total of $628,788,017.

In estimating the prospective development of California we must add to the factors natural wealth, population and property—what carefully gathered facts show concerning the variety of her industries, and the characteristics of her people.

What is California Producing?

Answering this question as briefly as possible, and somewhat retrospectively, we have first, *gold*, of which in the last twenty-five years she has produced more than all the rest of the world. Though it is estimated that seven-eighths of the gold now in use in the country has come from her mines, these vast tributaries to the world's progress are by no means exhausted.

The actual decline in the gold product, and the depreciation of the value of mining property is owing to the discovery of valuable deposits of treasure in neighboring States, which have attracted the roving mining population, and to the diversion of labor and capital into other channels, rather than to impoverishment. The value of the gold produced in California in the year 1870, as reported by the leading newspapers, was $23,000,000; of silver, (exclusive of that counted as part of the gold yield), $1,000,000; of quicksilver, $1,500,000; of coal, $1,000,000; miscellaneous minerals, $500,000, making an aggregate of $27,000,000, or fifteen per cent. of the total annual value of the Industrial products of the State. Besides this we exported ores, *which ought to have been smelted here*, to the value of $1,064,671. The export of treasure this year, for the quarter ending April 1st, exceede that of last year by a million of dollars, not including any of that which goee east by rail directly from the minee.

Total for 1871	$3,979,278.19
Add duties, net	1,528,864.48
Net	$5,508,142.57
Total for 1872	$4,833,684.02
Add duties, net	1,137,810.01
Net	$6,031,494.03

This treasure finds its market as follows:

China	$1,747,245.00
Central American Ports	196,223.09
England	878,640.31
Japan	1,337,757.43
New York	1,052,816.19
Peru	500,000.00
Mexico	10,000.00
East Indies	170,000.00

The Japanese Government which took only $20,590 from ue last year, is requiring a large amount for its mint, and will not complete its re-coining for several years to come.

The destination of the quickeilver and copper exported during the laet quarter, is taken from the oommercial statistics of the port of San Francieco.

Quicksilver.

	Flasks	Value
New York	502	$39,119
Mexico	335	21,110
Australia	200	13,005
China	6,300	84,062
Callao	300	19,508
Total	2,737	$195,804

Copper Ore.

Great Britain	585	$35,257

Increase over same quarter 1871, $14-620.

Forty-five per cent. of the total annual value of California's products is derived from her *agriculture*.

After a careful compariecn of the report of the Federal Commission of agriculture 1868-9, with that of the State Surveyor General, and with the receipts of domestic produce at San Francisco from July 1st, 1869, to April 3d, 1870, compared with the same period of the previous harvest year, the value of these in 1870 was estimated at $89,000,000, classed as follows:

Cereals (33,788,418 bush. at from $1 to $1 05 per bush.)	$33,080,860
Hay, (388,133 tons at $15 per ton)	5,821,990
Potatoes, peas, beans, and root crops	1,500,000
Kitchen vegetables, sweet potatoes, and all products of that class	5,688,270
Fruit trees and vines	8,250,000
Domestic animals (increase and produce of	15,346,000
Improvements on farms by agricultural labor	20,000,000
Total	$89,000,000

In the years 1868-9, there were 2,132,150 acres under cultivation, and 4,463,127 acres enclosed. In the year 1870, there was more than 1,000,000 of acres *sown to wheat*; in 1871, 1,478,891 acres, yielding 17,288,544 bushels.

The unfavorable character of the last two seasons has temporarily depressed the wheat growing interest, which during the next few years must assume enormoue proportions, because it will continue to yield the largest return upon the amount of investment both in capital and unskilled labor which it employs. The available wheat lands of California now amount to five and a half millions of acres, which will without doubt be increased by reclamation, railroad facilities, etc., to 13,000,000 acres. It is a reasonable expectation that wheat growing will be developed to one-half ite ultimate capacity in the next twenty years mostly by the plaiu farming hitherto employed which gives an average return of 17 bushels to the acre. Our best resulte as showu by *country* statistics fall twenty per cent. below the average yield in England. Wheat *culture* worthy of the name, would double these figures.

What Does this Great Staple Cost?

By careful estimates made in the San Joaquin valley, where the best facilities for culture exist, the cost of putting in and harvesting one thousand acree may be stated thus: Ploughing, $395; sowing, $25.60; harrowiug, $58.28; heading, $232.38; threshing, $220; sacks, $1,950; hauling, $375; machinery, $150; seed, $1,000. Total, $4,406.26. A crop of twenty bushels to the acre, (which is a low estimate for that district in a good year) would give a yield of 20,000 bushels.

Mr. Moseley of Stockton estimates the wheat product of the San Joaquin valley counties as far south as Tulare for this year at 13,500,000 bushels, at an average of twelve bushele to the acre. Another eetimate of twenty-three counties with the San Joaquin valley with wheat at $1.00 per bushel and barley at 75 cents, gives the value of the two crops thus, wheat, $28,000,000; barley, $7,354,500. Total, $37,054,500.

Friedlander's estimate is that we shall have 12,000,000 centals or 20,000,000 bushels of wheat for export, worth at $1 per bushel, $20,000,000 in cash, enough to tax our facilities for transportation to the utmost.

In the year 1870 the United States exported to foreign countries, as shown by the Annual Report on Commerce aud Navigation, 36,584,115 bushele of wheat, worth $47,171,229. Also 3,463,333 barrels of wheat flour, worth $21,169,593.

The annexed table will show where the great markets of the world for this staple are to be found and their relative importance.

Amount of wheat and wheat flour exported from the United States in 1870, acoording to the Annual Report of Commerce and Navigation, is as follows:

	WHEAT		WHEAT FLOUR	
Names of Countries.	*No. Bush.*	*Value.*	*Barrels.*	*Value.*
To Australia	78,398	$82,182	62,260	$308,007
To China, Hongkong and Singapore	51,805	55,395	169,991	782,557
To Japan	14,470	15,178	20,014	104,284
To Sandwich Islands	987	886	8,557	42,620
To England	21,779,373	28,024,755	932,808	5,190,881
To Scotland	2,308,300	3,053,868	297,520	1,759,439
To Irelsnd	3,699,935	5,225,061	58,623	351,568

What Does it Cost to Move this Crop.

From San Francisco to Liverpool, before the opening of the railroad, the cost was estimated at 40 cents, in gold per bushel. For the entire wheat region of the State to San Francisco it may be put at 20 cents a bushel, including handling, warehousing, and all other expenees. From the field to the English dock, one year with another, it costs 60 cents per bushel, and brings in that market 30 per cent. higher than any other American. The cost of transportation from Iowa to Liverpool is $1.25 per bushel. Our wheat costs in the English market nearly the same as the best Russian, the only grain which equals it in excellence. The cost of eending our grain to China, is $3 per ton.

Barley and Other Products.

California ie the first barley-producing state in the Union. The last official report showed 696,001 acres sown, producing 9,570,321 bushels. Of other grains there were oats, 113,269 acres, producing 3,714,480 bushels; rye 3,692 acres, producing 20,-795 bushels; corn, 57,364 acres, producing 1,434,317 bushels; buckwheat, 803 acres, producing 13,479 bushels. Of minor farm products, peas, 94,106 bushels; castor heans, 682,325 pounds; potatoes, 3,092,177 bushels; sweet potatoes, 173,-405 bushels; peanuts, 193,304 pounds; beans 503,201 buehels. Of hay, 460,018 acres, producing 685,446 tons.

Taking the exportatiou for the quarter ending March 31st, 1872, as a basis, Mexico is the largest foreign consumer of our barley, the Sandwich Islands and British Columbia of our oats. Both China aud Japan are increasing their demand for these staples.

Hop Culture has been very profitable in California owing to failuree of the crop in the Eastern Statee and Europe. Eastern buyers have shipped 3,000 balés overland during the past year. Japan will prove an excellent market for all the hops which we can raise.

Flax Culture has been steadily increasing with us. From the demand for flax straw for bagging purposes, 7,376 acres were planted last year producing 760,700 pounds of seed, which finds its present market in mills of San Francisco.

Beet Culture may hereafter be considered as one of our most important industries, as it will relieve an immense drain upon our resources. The average annual importation of eugar into the port of San Francisco is something more than 50,-000,000 pounds, worth, dutiee paid, about $5,000,000. Should the euccess of the Alvarado Beet Sugar Co., who manufactured one and one-quarter millions of pounds of sugar of the finest quality last year, (worth $150,000 in San Francisco), inspire our farmers to co-operate in the production of this important luxury, we can easily retain the value of 300,000 acres of wheat which goee out of the State to purchase an article in no respect superior to our own. For thie product our market is at our own door.

Dairy Products.

The late shipmeut east of 60,000 pounds of choice table butter is one of the most significant indications of progress iu California. The produce of last year was estimated at 4,419,627 pounds of butter, and 5,488,266 pounds of cheese. One-third of this is made in Marin county. Shasta county, one of the best dairy countiee in the State, is not included in the above report. There can be no doubt that dairy farming is destined to become one of the most profitable eources of wealth to the State.

The Product of Our Vineyards.

The raising of grapee and manufacture of wine and brandy hae been brought to a degree of perfection, which places the present and prospective value of this industry beyond cavil. Our wines have received the highest encomiums from competent judges both in the Eastern States and in Europe, and their reputation is uow beyond injury from liquor speculators, or unskilled manufacturers. They have to compete in our home market with "traveled" winee, which we are childish enough to import at a cost to ourselves of more than $550,000 dollars, while wo eend one-half of our own product to the Eastern States, and our own champagne manufacturers are unable to supply the Eastern and foreign demand. Last year we produced eix million gallone of wine, worth $3,606,000, and one hundred and fifty thoueand gallons of brandy worth, dutiee unpaid, $112,500. This year we ehall produce from eight to ten million gallons of wine, worth at least, $4,500,000, with not lees than 200,000 gallons of brandy worth $150,000.

Our markets will be the following pointe, named in the order of their commercial importance: New York, (which took from one firm in the years 1871-72, 476,814 gallone, costing $375,520), Central America, British Columbia, Russian Asia, Mexico, Japan, China, Honolulu, Liverpool, Tahiti, Australia and New Zealand.

Wool.

It was not nntil 1854 that the breeding of fine wooled eheep commenced in California, ever since theu the quality of this product has been becoming more valuable, until at present the finest pasture ranches in the State are covered with flocks. In 1860 there were 900,000 sheep in the State, there are now 3,178,671. The censue returns ehow that the largeet proportional increase of the wool product of the country has beeu here, the last clip amounting to 17,565,935 pounds. Nearly all our manufactured wool finds a market in the Eastern States; its value last year amonnted to $2,000,000.

The present prospect is that our spring and fall wool clips will yield 30,000,000 pounds, and that the average value in gold will be about 40 cte. per pound, (that now coming in from the southern counties is selling at 41 cts.) making its aggregate value $12,000,000. The fruit and grape crops promise abundantly. It has been computed that the aggregate agricultural and horticultural products of 1872, uot countiug beef, pork, butter and cheese, will be worth not less than $53,000,000, of which $35,000,000 will be exported.

According to the estimates of 1870 before referred to, our manufacturee repreeent 40 per cent. of our prodnctione. During that year we exported lumber, ehingles and other foreet products, bricks, brooms, blankets, billiard tables, glue, cigare, machinery and iron work, barrels of flour, bread and crackers, with emall quautities of miscellaneous articles to the value of $2,202,205, also fish, to the value of nearly or quite $100,000. The product of the soap root, used as a substitute for horee hair was valued at $100,000.

I have already exceeded the limits proposed to myeelf in this article. Of the United States imports for 1871 from foreign countries, $13,099,687, went to pay for productione which California can grow and manufacture with unequalled facility. The sugar, butter, wine, raisins, etarch, olive oil, tobacco, eoap, imported to this State should have been produced at home. We are consuming 300,000,000 pounds of rice, with excellent rice lands undeveloped. Our ores should be reduced, our wool and leather ehould be manufactured here. The machinery for our minee, railroads, steamships, and the shipe themselves ehould be made here. All these things are needed to make us the eommercial centre of the Pacific countries.

Iron and Steel.

The immense advance in the price of all kiuds of iron within a comparatively short space of time, has taken part of the commercial world by surprise; hut it could not have hcen entirely unexpected by any one who had watched the current of events. For the past ten years, the influcnce predominaut in the commercial world aud in the social state of Europe, have heeu tendiug slowly hut surely in this direction. The immense development of the manufactures of which the raw material is iron, the extension of its consumption over vast regions where it was but hitherto little used, the rise iu wages and in general prices, and the result of the competition amougst the producers of pig iron, have all concurred in bringing ahout the present high prices. The construction of the Crystal Palace in Londou in 1851, having all the frame-work of iron, suggested a new use for that metal. Since then it has heen used extensively as a material for house-huilding, for supporting pillars, stairways, etc., for sidewalks and bridges. And siuce then, the railroad system of the world, which ahsorhs such au immense quantity of iron, may he said to have heen laid down. And new uses are heing found for it every day; the steamships of the world are now heing built of it. Then, duriug the last thirty years, the cousumption in the United Statcs has increased in a tenfold degree; where a thousand tons was used, six thousand is now used, and in this city, one house imports as much as the whole eight did, ten years ago. Then the iron trade of England with Australia. Southern Africa and India has grown up siuce. Thousands of milcs of railroad are constantly in course of construction in the latter country, as the cost of labor is next to nothing, and hundreds of ships leave England for it, freighted with iron, every year. Egypt has lately ahsorhed large quantities; Persia is heginniug to ahsorb foreign iron, and the quantity taken hy Russia from England for the great railway system, is simply enormous. Wages and the prices of necessaries of life have arisen greatly during the decade, and the competition hoth between producers and sellers of iron has heen excessive. Hence, during 1871, the workmen in Europe came to the conclusion of ceasing to work at the rates at which they had heen previously employed, aud notified their masters to that effect. The latter promised them an advance after the new year, and that promise has heen kept. The stocks have heen low, as the manufacturers did not feel justified in keeping them up, on account of the unsatisfactory state of the market, at least this is what is alleged; certaiu it is that stocks are low, that they have been purposely kept so, and that orders are now high and cannot he satisfied.

The Largest Stove Foundry.—The stove foundry of Jewett & Root, Buffalo, is said to he the largest in the world. The great stove warehouse is 100 hy 150 feet, and has seveu floors, all, except the grouud floor and sample floor, heing piled with ever dcscription of stove. (They have 250 distinct sets of patterns.) The foundry gives employment to 450 men, consumes from 40 to 55 tons of pig iron every day, and turnes out ahout 60,000 stoves a year.

Gas.—In 1860, there were 810 gas companies in England aud Wales, 141 in Scotland and 64 in Ireland. The average price charged was $1.80 per 1,000 cu. ft. Iu 1863, there were 433 gas companies iu the United Statcs, the price charged per 1,000 cu. ft., varying from $1.50 in Pittsburg, Pa., to $12.50 at Marysville, Cal.

Still Burning.—It is said several large coalpiles in Chicago have never heen extiuguished since the great fire.

Useful Information.

Ventilation—A Field for Invention.

We have made little progress in this country in the art of ventilating dwellings and public edifices. If a contract is given out for the construction of a costly house, it is as ten to one that the builder will make no provision whatever for ventilation, and if he follows his own notions he will not even secure the advantages of a good light. Now and then an architect of advanced ideas insists on ventilation and tolerable acoustic advantages for public edifices. It is estimated and we believe truthfully, that 35 per cent. of the diseases of cities are caused by improper trapping of waste pipes in houses, and of bad or altogether neglected ventilation in bed-rooms and sitting-rooms. Proximity of parlors and dining-rooms to the cold and damp ground underneath is also a prolific cause of household disease among women and children. The perfect dwelling is an invention rather of the future than of the present. It will have perfect ventilation for every room, cross lights will be avoided, the warming apparatus will be something else than close stoves, and the kitchen will be so isolated or otherwise arranged that the odors of that department will not pervade the whole house.

Sanitary considerations will have the first place, from the choosing of a site to the driving of the last nail. A house without proper drainage will be avoided as little more desirable than a pest house.

It is an open question whether the model house of the future will be furnished with gas-lights or carpets. If gas is tolerated, it will be of some standard quality, and there will be such perfect combustion that books and pictures will not be ruined. Carpets will either go by the board or the score of health, or will appear in the modified form of mats which are removed or changed every day. It may be a long way to the attainment of all these improvements. It ought not be a long way to a perfect system of house ventilation.—*Bulletin.*—

How to Make a Cheap Cellar Bottom.

In sections of the country where there is an abundance of cobble-stones, collect a few loads of them about four or five inches in diameter, grade the bottom of the cellar, lay the cobbles in rows, and ram them down one-third their thickness into the ground, so that they will not rock nor be sunk below the line of the rows by any heavy superincumbent pressure. The bottom of the cellar should be graded so that the outside will be at least two inches lower than the middle. A mistake sometimes occurs by grading the cellar bottom in such a manner that the center will be two or three inches lower than the outside. When this is the case, should water enter from the outside, it will flow directly towards the middle. A straight edged board should be placed frequently on each row of stones as they are being rammed, so that the upper sides may be in a line with each other. After the stones are laid and well rammed down place a few boards on the pavement to walk on; then making a grouting of clean sand and water lime, or Rosendale cement, and pour it on the stones until all the interstices are filled. As soon as the grouting has set, spread a layer of good cement mortar one inch thick over the top of the pavement, and trowel the surface off smoothly. In order to spread the mortar true and even on the surface, lay an inch board one foot from the wall on the surface of the pavement, stand on the board, and fill the space with mortar even with the top of the board; after which, move the board one foot, fill the space with mortar, and trowel it off smoothly. Such a floor will cost less than a board floor, and will endure as long as the superstructure is kept in repair.

A floor made in the foregoing manner on the ground in the basement of a barn, a piggery, or a stable, would be rat proof, and would be found cheaper and more serviceable than a plank floor.

A Mammoth Aquarium.—Dr. Anton Dorhn, in a letter to Professor Agassiz, writes that he has matured a plan of establishing a large laboratory for marine zoölogy in the Mediterranean. He has obtained permission of the authorities of the city of Naples to construct a large building, at his own expense, in the Villa Reale, at Naples, close to the sea containing a large aquarium of the public, and extensive rooms for naturalists of every country. Dr. Dohrn, with two or three other German zoölogists, will settle there, and conduct the administration of both the aquarium and the laboratories. He wishes information regarding this proposed laboratory to be widely extended, and earnestly invites all who may visit Naples to visit the aquarium. An annual report of the work done and the progress made at the zoölogical station will be published. A committee has already been formed to give further dignity and importance to this project, consisting of Messrs. Helmholtz, Dubois-Reymond, Huxley, Darwin, Van Beneden, etc, and, in America, Professor Agassiz.—*Once a Week.*

A Flying Dragon.—Among the remains discovered last year in Kansas by Professor Marsh and party were bones of the flying dragon. Professor Marsh judges that the dragons, to whom these fragments of bone belonged, must have measured, from tip to tip of their extended wings, some twenty feet.

Light, Heat, and Electricity from Motion.

The celebrated Jacob Perkins when in London, in 1837, exhibited at the Adelaide Gallery the phenomena produced by the contact of soft iron with steel in motion, which he described at the time as follows:

"The action of a soft iron disk upon hard steel, such as a file, is exhibited four times a day. This has been regularly kept up for three years, yet it has undergone very little wear. I am of opinion, in fact, that if the file had never been held upon it until it had attained its full velocity, there would not have been any loss of metal. I do not know to what extent the combustion of steel by soft iron may have been carried in the United States, but our experiments are so brilliant as to excite the highest admiration, and to induce numbers to repeat their visits to the Gallery. Our disk is a foot in diameter and an eighth of an inch thick. It requires about a three-horse power to drive it, and revolves about 6,000 times in a minute. It is very accurately fitted up with friction wheels. The blaze of light, which rises about twelve inches, perpendicularly, from the point of contact, is so vivid that few persons can look steadily at it even at noon day. The stream of light is about an inch and a half thick at the distance of a few inches from the point of contact; and at the distance of seven or eight feet, it spreads out to about ten inches. The sparks not unfrequently touch the ceiling, which is about twenty feet high; a ring of fire is seen all around the disk, appearing like a band of light about five-eighths of an inch wide. Of what does this light consist? It is manifestly different from that of the sparks, which all fly off in a tangent. In operating with the disk, it never becomes warm; the file, however, has to be held at least two inches from the sharp end, as it becomes highly heated. The whole appearance, in fact, is very interesting, and when fully investigated, I am well convinced that some of the phenomena will no feund to depend upon electricity."

Origin of Lager Beer.—The German words lager beer signify stock beer—i. e., beer that has been stowed away. The story, as told in Germany is an old one, and runs thus: Many years ago, a shoemaker near Bamburg, sent his apprentice to get a bottle of Bamburg beer, which was sold at that place; but the boy not knowing this, went to the city itself. On returning he met an acquaintance of his who told him that when he would come home his boss would whip him for staying so long. The poor boy who was frightened at this, thought it better no to go home at all, but took his bottle, buried it under a tree, and ran away. He went among the soldiers, where he distinguished himself so that in a short time he became an officer. When one day his regiment was quartered in this little town, the officer thought it proper to pay a visit to his old boss, but not before he had got the bottle of beer which he had buried some years before under the tree. When he entered he said, "Well, sir, here I bring you your bottle of Bamburg beer that you sent me for." The shoemaker not knowing what this meant, was told by the officer all about it. The bottle was opened, and the beer was found to be of superior quality. When this fact was made known, some of the brewers built deep vaults, where they put their beer, and called it after it had lain some time, lager, which did not mean anything more than lying. The officer afterward married the daughter of the shoemaker, and drank a good deal of lager beer, receiving in his occupation the assistance of his father-in-law.

An Ancient of the Earth.—An almost entire human skeleton, fossilized, has been found in Hungary, together with a stone hammer, in a geological formation, indicating that the living man existed long before the mammoth age. The contemporaneity of man with the mastodon had before been pretty well established by discoveries in the lacustrine deposits and bone caves of Europe, including a tolerably well carved image of the mammoth on a piece of bone. All recent researches establish for man an antiquity so remote that the period in years cannot be calculated. The evidences on this score that have been accumulated in California are particularly numerous and convincing, and will astonish the world when collectively presented.

Plumagery.—The most skillful use of plumagery there is any record of, seems to have been practiced in Canton, China, long before that country was well known to outside barbarians. Bird's feathers were woven into cloth which was called, in the native vernacular, goose-velvet. The foundation of the fabric was silk, into which the feathers were skillfully and ingeniously woven, on a common loom, and it seems to have made the most elegant appearing cloth for a garment ever produced. We saw a sample of it some years ago, in the hands of a missionary, who was informed that its manufacture had been discontinued many years before.

Household Utensils of Paper.—In Pearl street, New York, there is a mill which makes from paper such articles as milk-pans, cups, bread-pans, wash-bowls, etc., which are said to be superior to wood or metal. The paper after being pulped, is pressed into shape, dried, enameled, and subjected to a heat that would destroy some utensils of the kind. The material is light and easily handled, and does not rust, shrink, leak or easily break.

Good Health.

The Cause of Hunger.

When the system begins to need nutriment, it sends a fluid from every portion of the body toward the stomach, where it accumulates in little reservoirs, the distension of which causes the sensation of hunger; the fuller they become, the more hungry are we. This fluid not only gives notice that food is needed, but it has the power of dissolving it, as water dissolves sugar, and thus prepares it for yielding its nutriment to the system. If, therefore, a person eats without an appetite; without being hungry, there being none of that dissolving fluid in the stomach, the food is not dissolved, does not undergo any healthy change; on the contrary, being kept up to the stomach heat of about a hundred degrees, it soon begins to ferment, to decay, to rot; if meat, it literally becomes carion; if vegetable, it sours; in either case, generating gas and wind, causing unseemly belchings and noisome eructations, or these gases, being confined, distend the stomach, causing pressure against the nerves, originating various pains and discomforts more or less distressing, to last sometimes for hours or half a night, preventing refreshing sleep, to be followed by a day of general discomfort and unfitness for business. Sometimes the stomach becomes so distended with wind that it crowds up against the lungs, preventing them from receiving their proper amount of air, and there follows a distressing feeling of impending suffocation. These same effects follow when too much food is eaten, more than there is fluid in the stomach to dissolve.—*Dr. Hall.*

Education and Health.—It is impossible that the mass of men can be healthy, and so moral and successful, without some knowledge of their structure, and of its laws, which they must obey or suffer. How can a young woman be called educated who is ignorant of physiology, of her duties as a mother, of the divine art of nursing? How many men know anything of the relations of waste and supply in the nervous economy? Why, not one man in a hundred knows even what the stomach is made for, and the other ninety-nine are constantly transgressing rules they have never learned. We may take the old parable of the apple in the garden as an illustration of the way men's stomachs make havoc with their moral sense. Not one man in a hundred knows or suspects that God made the air to be breathed. Every part of his house may be reeking with miasma, the cellar full of all evil, the partitions clotted with dormant mischief, and he never dreams of it, but goes on nailing down his windows and listing his doors. If we could only see the air we have once breathed over! Even the architects of our public halls and theatres and churches have the crudest notions of ventilation.—*Henry Ward Beecher.*

Sleeplessness and the Remedy.—The best anodyne is a liberal amount of muscular activity out of doors every day. Persons who sit around the fire and lounge on the sofa, or read or sew a great part of the day, need not expect sound sleep; only the laboring man can taste it in all its sweetness. Many fail to sleep at night because they will persist in sleeping in the day time. It is just as impossible to healthfully force more sleep on the system than the proportion of exercise requires, as to force the stomach to digest more food than the body requires. Rather than court sleep by industrious activities, many persons resort to medicine, and every new drug which is heralded as a promoter of sleep becomes at once immensely popular, even though it is known to possess dangerous qualities. Chloral hydrate has had a great run, and even young men are known to be purchasing it at the drug stores, to be used in promoting sleep; it should never be taken unless advised by the family physician, for the medical journals are constantly publishing cases where serious harm and even fatal results attend its habitual use.—*Journal of Health.*

Dark Rooms — Sunshine.—Windows were originally intended to let in light and air. Modern housekeepers, however, from the mansions of the wealthy to the cabins of the very poor, vie with each other in shutting out the blessed sunshine and pure air. Windows are studiously curtained, double, dark, and very generally closed. Let the shades run up easily on rollers attached to the sash, and the sash always dropped an inch or two.

Sunlight is an element of life. It decomposes and scatters, in connection with pure air, these death seeds. When fevers are epidemic, in large cities, or in wards of hospitals, the sunless rooms and sides of streets report a much larger number of deaths than ever found where sunshine can enter, even for one hour a day. Is it from indolence or ignorance, or sheer thoughtlessness, that the people seem to study how to shut out the sunshine? Blinds and vines, curtains and draperies, are used to bar the entrance of the life-preserving sunshine. Death lurks in darkness. Even the potato vine cannot thrive in a sunless cellar.—*Journal of Health.*

Heat of the Body.—Warm weather is coming; we need less internal heat; and as this internal heat comes from the food we eat, we do not need as much food: hence, like a watchful mother, Nature takes away our appetite, so that we may not eat so much as before, to burn us with fever.—*Dr. Hall.*

How to Cure Stammering.

Lute A. Taylor, of the La Crosse (Wis.) *Leader*, who has been an inveterate stammerer, writes as follows about the way to cure the habit: "No stammering person ever found any difficulty in singing. The reason of this is that by observing the measure of the music—by keeping time—the organs of speech are kept in such position that enunciation is easy. Apply the same rule to reading or speech, and the same result will follow. Let the stammerer take a sentence, say this one—'Leander swam the Hellespont'—and pronounce it by syllables, keeping time with his finger, letting each syllable occupy the same time, thus: Le—an—der—swam—the—Hel—les—pont, and he will not stammer. Let him pronounce slowly at first, then faster, but still keeping time, keeping time with words instead of syllables, and he will be surprised to find that, by very little practice, he will read without stammering, and nearly as rapidly as persons ordinarily talk or read. Then practice this in reading and conversation until the habit is broken up. Perseverance and attention is all that is necessary to perform a perfect cure."

Warm Bath in Insanity, and in Burns.—Dr. Wilkins, in his *Report* to the California Legislature, on Insanity, refers to the warm bath as a favorite treatment in Italy and in some parts of Holland and France. He often saw a dozen patients in one bath-room with their heads alone in sight, the bathing tub being covered except a hole for the head. There they usually remain from one to three hours, in some instances six to eight hours, and occasionally for days at a time. Dr. Guddeu, of Zurich, kept a man thus immersed for five days, on account of a high state of excitement connected with bed-sores. The patient is represented to have slept well a portion of the time, and to have been cured of the sores. No exhaustion or ill consequences followed. A case is related of a man scalded by steam, and not insane, who was placed by Hebra in a tepid bath and kept there for three weeks, until a new cuticle had formed over the entire surface. This patient recovered without inconvenience. The water was kept at the temperature most agreeable to the patient. Thus employed it is said to relieve effectually the extreme pain from the burns.

Decay of the Teeth.—The acids which cause the decay of the teeth are conveyed in the secretions of the gums and the mucous membrane of the lips and cheeks; and the usual points of attack are in the interstices and the groove in the facial walls of the teeth. The calcularly nature of the saliva is antagonistic to the acids and preserves the teeth from their dilapidating influence. Teeth are protected from this disease by the following conditions: Their irregular shape and order that the situations for the deposit of acid be as few as possible; the conservation of the teeth from noxious influences by constant brushing; the healthy structure of the tooth itself and of the mouth generally. Heider observed that the yellowish white teeth are less subject to the attacks of caries than those of a bluish shade, the enamel of the former being much harder; and the molars have been found to contain more mineral substance than the incisors.

Sunshine and Sleep.—Sleepless people—and there are many in America—should court the sun. The very worst soporific is laudanum, and the very best, sunshine. Therefore, it is very plain that poor sleepers should pass as many hours as possible in sunshine, and as few as possible in the shade. Many women are martyrs, and yet they do not know it. They shut the sunshine out of their houses and their hearts, they wear vails, they carry parasols, they do all possible to keep off the subtlest and yet most potent influence which is intended to give them strength and beauty and cheerfulness. Is it not time to change all this, and so get color and roses in your pale cheeks, strength in our weak backs, and courage in our timid souls? The women of America are pale and delicate; they may be blooming and strong, and the sunlight will be a poteut aid in this transformation.

Embalming.—The art of petrifying the human body is said to have reached a high state of perfection at the hands of the Italian professors. They can render the body like stone, or by immersion in certain liquids it seems only to be asleep. Gozini, of Genoa, has a curious museum of humanity petrified, well worth seeing. The ancients mummified, but that changed the appearance, while this process leaves the subject life-like in appearance. The body of Mazzini is to be so preserved.—*Ex.*

The art of embalming has probably been brought to as high a state of perfection in this city as ever at any time at any part of the world. The process here employed leaves the body in a perfectly natural state—the color upon the cheeks and lips, and and even the delicate pink upon the finger nails is brought back, after death, almost, or quite as natural as in life.

Eating.—It is a great mistake to suppose that the more one eats the stronger he becomes. Gourmands are not giants. We gain in strength in proportion as the food eaten is digested, assimilated and converted into new and perfect material. Intemperance in eating is only more common than intemperance in drinking; but, according to the Latin proverb—"*Plures crapulâ, quamgladious*—"Gluttony kills more than the sword."

Scientific Press.

W. B. EWER.....Senior Editor.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Advertising Rates.—1 *week.*	1 *month.*	3 *months.*	1 *year.*
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 8d. Large advertisements at special rates.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Saturday Morning, May 25, 1872.

Gold and Legal Tender Rates.

San Francisco, Wednesday, May 22, 1872.—Legal Tenders buying, 89; selling, 90. Gold in New York to-day, 114.

Table of Contents.

Illustrations—Whelpley & Storer's Pulverizing Mill, 321. Brown's Paten Fire Hydrant, 329.

Editorials—The San Francisco Microscopic Society. 321. Iron and Steel, 326. Mining as an Investment; Congressional Affairs; Utah News, 328. The Frear Artificial Stone, 329.

Correspondence—Ophir District, Utah; Gold vs. Silver Mining; Mines at Alder Gulch, Montana; From Our Correspondent L. P. Mc., 323.

Mining Summary—Reports from mines in various States, Counties and Districts: Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory. 324-5.

Scientific Progress.—Relations of Calorific Power of Combustibles to Composition; Carbonized Sewage; Transmitted Radiant Heat; Preservation of Wood; Peruvian Antiquities, etc., 323.

Mechanical Progress.—Economy of the Hot Blast; Puddling Steel Rails; Railroad Improvement. Burnt Iron and Steel; The Turbine Propeller; Pressure in Steam Boilers, 323.

Useful Information.—Ventilation—A Field for Invention; How to Make a Cheap Cellar Bottom; An Ancient of the Earth; Light, Heat and Electricity from Motion; Origin of Lager Beer; Plumbagery, 327

Good Health.—The Cause of Hunger; Education and Health; Sleeplessness and the Remedy; Dark Rooms—Sunshine; How to Cure Stammering; Warm Bath in Insanity and in Burns; Decay of the Teeth; Sunshine and Sleep; Embalming, 327.

Domestic Economy.—Mushroom Catsup; Rules for Washing Dishes; Helpful Hints for the Household; Wood Fires; Porcelain Wash Tubs; Something New in the Kitchen. 331.

Miscellaneous—Pacific Coast Products and Their Future Market, 326. New Incorporations; Meetings and Elections; Mining Accidents; Patents and Inventions, 332.

British Columbia Items.—On Williams Creek the Cariboo Company are at work, and the Ballarat and Forest Rose companies are idle, but will resume work shortly On Harvey Creek all the companies are preparing for summer work. News from the new Omineca is meagre, but it is expected that the camp will he very lively this summer and $7 per day is expected to be paid for labor. Some of the claims are making expenses, but with the exception of a strike made a few miles above Germansen, which paid two ounces to the hand, and only two feet to bed rock, nothing big has been struck. Provisions are high.

Nevada Borax.—The borax fields of Nevada are at length attracting attention abroad, and parties in Europe have recently been making inquiries in regard to them. It is stated that there are at least 3,000 acres in Esmeralda county, the deposits on which vary from half an inch to three feet in thickness.

Railroad Party.—The train containing the Directors of the Pennsylvania Central Railroad arrived here on the 17th instant. The excursion is under the direction of J. Couthony, of the Pullman Palace Car Company. The excursion is one of pleasure only, and the party will visit Yosemite Valley, the Big Trees, and other points of interest in the State before their return.

The members of the American Society for the advancement of Science are expected to arrive in this city about the first of August.

Mining as an Investment.

It is unfortunate for the mining interests of the Pacific Coast that the difference between mining with the pick, gad and shovel, and mining with certificates of stock is not more generally recognized. The fascination of gaining sudden wealth in "stocks" is very great, especially to those of small means who fail to see why they have not an equal chance with the capitalist in proportion to their investment. Those who are familiar with the ways and means of mining capitalists, "rings" and brokers could tell them why; but a deaf ear is turned to all advice and remonstrance. A good many think they have "reliable information," supposed to be known to the favored few, but they show their stupidity hy not being aware that this "reliahle information" dodge is one of the most powerful tools used by "mining sharps" to rid themselves of stock about to fall. The temptation of large returns for small investments is alluring although the man of business recognizes the fact that high interest and bad security go hand in hand.

The dangers incident to stock speculation should be seriously considered by small operators, for it is a business in which advantages of any kind may he taken by dealers, since it has become by popular consent and custom to be looked upon not only as honorable, but, since in our day success is the criterion of merit, the capitalist who has notoriously amassed his wealth hy sharp practice and at the expense of hundreds of others, is regarded, like Merdle in "Little Dorrit," no matter what his social characteristics may be, as one who has shown marked ability, and whose acquaintance should be cultivated. This speculative mania has wrought a pernicious influence in the community, while the mines that have been its objective point have neither been injured or improved by the reputation which the value of their stocks have given them.

The Business of Mining

Legitimately conducted, is one peculisrly suited to the people of this coast since it promises large returns and embraces so wide a field. If we can only succeed in awakening a deeper interest in it *as a business* among our capitalists, it will not only realize extensive returns to them but afford employment and profit to the industrious laboring classes. By this we mean mining—quite apart from any speculstive operations in stock, for while we desire to encourage legitimate mining enterprises, mere speculation should be discouraged.

The question will be asked by some who have been victimized in large companies, why are there so many failures, and why are so small a proportion of the mines called at the Stock Board dividend-paying? If the men who ask these questions were interested enough to take a trip through a few districts where hard-working miners are developing their own claims, and then return to San Francisco and get a few points concerning the management of large companies, the conclusion they would he compelled to draw would answer the questions satisfactorily. Moreover, the proportion of amount of dividends and assessments should he taken into consideration before any rash assertions are made. This month, for instance, 11 assessments so far have been made, and only five dividends have heen paid by mining companies called at our Stock Boards. The five dividends amount in the aggregate to $1,067,000, and the eleven assessments amount in the aggregate to $351,750, leaving a clear gain in favor of stockholders of $715,250. When the two sides are represented in figures, which are matters of fact, even now when mining is seemingly in disgrace because stocks are low, the account balances very favorably.

The great mistake has been that quartz mining has been considered as an exception to general business rules, but hard experience has proven that it has its definite business restrictions like everything else, which cannot be disregarded without failure. The extravagance that has prevailed has chiefly originated in the inflated notions which have existed respecting the richness and inexhaustible quantity of ores attainable, which it is always presumed will increase in both quautity and quality with depth. This delusion is not yet fully dissipated. Existing local circumstances, geological formation, width, ore supply, etc., must he taken into consideration before such conclusions are adopted. Superficial bonanzas which do not "go down" are frequently mistaken for veins of illimitahle depth, mills and hoisting works erected, and expenditures made heyond all reasonable hounds—and failure the result. It will not do to huy everything and anything which the owners call a ledge, or hy supposing it rich enough to invest $40,000 or $50,000 in machinery, etc., hefore it is known whether there is any ledge or not. Such a course ignores common sense and prudence, and exerts a disastrous influence on all legitimate mining operations.

Some of the Mistakes in Mining.

It has been the object in past days to get the greatest possible amount of money in the shortest possihle time, and the consequence of this mismanaged proceeding has been seriously felt. Millions of wealth have been made inaccessible by this thoughtless work and reckless thirst for gain. We have had, unfortunately, altogether too much amateur mining. People have gone into it blindfold and come out with their eyes very forcibly opened. In many places where the mines were unquestionably rich, and which in England, or any other country, where they are worked with care and systematic economy, would have paid handsome dividends, this smateur mining has made the companies bankrupt. Many instances are known where expensive mills have been erected in a good agricultural and grazing country, fitter for the plow than the pick, 15 or 20 miles from timber or a good supply of water, and further off still from any mine that by any geological or metallurgical possibility could be made to pay.

There is no business iu which men exercise so little judgmeut or foresight as they do in buying mining property, and in which the simplest rules are so eompletely ignored. If the business were entered into with the same precautions that are generally shewn by those who engage in commercial and mechanical pursuits, it would present less hazard, and he attended with less failure than any other. The history of mining camps is continually repeating itself without the examples being heeded. Surface ore comes cheaply and gives speedy returns, hut with the increase of depth the difficulty and expense of mining increases and the quality of ore often changes requiring more capital and more extensive machinery. In large companies, when the value of ore depreciates, the supply is kept up by extracting an amount that ought to take years instead of months to get out, the mine is ruined by had timbering and bad hasty work. More ore is taken out than the milling facilities require, which in our large mines, well supplied with mills, is seldom judicious.

Mills are always considered an immediate and absolute necessity without the probable permanency of the lead being inquired into. Heavy and expensive machinery is frequently shipped great distances before 10 tons of mineral-bearing rock are in sight. The estimates are invariably too small and assessment after assessment is levied before the mill can be finished; and, if more hy luck than management, the company pay a dividend, it is but the precursor of more assessments. No money is spent in actual development of the mine but is rather consumed in unnecessary expenses. It is better to first hegin to develop a lead before talking ahout working the rock from the first honanza struck, for the ore is just as safe on the dumps or in the mine until enough is in sight to at least pay for a mill. Still stockholders invest, generally, with the expectation that the mine immediately declare dividends, and if a mill is not erected very shortly and money forthcoming, they draw out. They begin backward, get the mill first and the mine afterward; instead of developing the claim, they only partially prospect it and then put up a mill. The mines should he properly opened, not gouged out, and a judicious superintendent will only extract as much rock as is necessary to carry it on. Many mines are upheld and salaries paid not by the proceeds of the mines but by direct calls on the stockholders in the shape of assessments.

The vicious constitutions of many of our companies are not always, however, to be attributed to design, but from undue haste and a want of knowledge, while defects have led to irregularities. Perhaps fraud would be a more fitting term in some instances where dividends have heen declared on borrowed money and an assessment levied immediately after to pay the loan. Such things are monstrous business ahsurdities. Stockholders have shown little or no discretion as to who should manage, and the consequences have fallen not only on them, but, if the same capital had heen properly expended it would foster and establish mining as a staple industry instead of what some suppose it—a rock to be avoided. It is of little use to point out instances as heacons to guide the unwary, for while stockholders show the apathy in the management of their mines that they do, it is difficult to protect them from the snares of designing men. It is a business which demands superior skill, judgment, education, and experience to insure profitable development, even with rich lodes. Mining engineers of sufficient attainments can generally tell whether the ground is ore hearing and can prepare sufficiently accurate estimates of cost, expenditure, etc., to warraut owners to go on or abandon the work.

[Concluded next week.]

Congressional Affairs.—A bill was introduced in Congress by Mr. Sargent, immediately after the passage of the Mining Bill, given in our last issue, which provides that land shall not he excluded from entry under the homestead or pre-emption laws, unless it is shown that *bona fide* mining claims exist upon it. This is This is intended to overcome the difficulties experienced since the Department of the Interior issued the "numerical land order" last year.

A bill has been introduced by Senator Casserly granting right of way and ten sections of land to a company to aid them in constructing a ditch from the Mountain Lakes of El Dorado County to a point in Sacramento County. Said ditch to carry 5,000 inches of water.

The Senate Committee on Mines and Mining have reported an amended bill to incorporate the Utah Railroad, Mining and Land Company. The Company proposes to incorporate with a capital of $5,000,000, and a right to increase it five-fold, to develop the resources of Utah by the erection of works, construction of railroads, working of mines, etc., in different counties, so as to connect the mineral districts with the adjoining railroad. A number of English capitalists are to he interested.

Utah News.—A dispatch from Salt Lake City states that a great body of ore, running to thousands of dollars per ton, has been struck in the 400-ft level of the Emma mine. Nearly $200,000 in silver bullion were received in Salt Lake City last week, and another car-load from Butterfield Cañon has arrived, weighing ten tons, and valued at $8,000. An effort is heing made to obtain a futher reduction in freight on ores for the East. Numhers of strangers are in the city, and the stages to the mining camps are all crowded with passengers. A dispatch of the 21st states that Judge Strickland delivered a decision on that day iu the Flagstaff mining suit refusing the injunction. It is understood that the plaintiff will file a new hill, praying for a restraining order, and also institute proceedings to set aside the patent. The struggle for this valuable property is creating considerable excitement in mining circles. There has heen another heavy snow slide at Little Cottonwood, in which several miners were buried, but were rescued uninjured, except one, who had his leg broken. A dispatch dated Salt Lake, 20th inst., states that on that day mining property in Tintic and Camp Floyd Districts to the amount of $500,000 was disposed of. A number of Pittsburgh capitalists are in Salt Lake City negotiating for mines.

Labor Strike.—The great lahor strike in New York last week for the eight-hour system was participated in by a large number of persons of many different trades. The proceedings of the meetings are said to have beeu conducted in an orderly mauner and no trouble occurred. The strike seems to have been entirely successful, employers having conceded to the terms imposed, hut whether it will be lasting or only temporary remains to be seen.

The Frear Artificial Stone.

The attention of the scientific world has for some years past been directed to the importance of devising some method for the production of an artificial building stone, which may be furnished at a low price, and at the same time meet all the conditions required for building purposes.

The very great expense of quarrying and dressing natural stone, and the unsightly, inartistic appearance of brick structures, operates as a very great drawback to the permanent and solid growth of many of our cities; or at least these difficulties lead to the erection of cheap wooden structures, or those of mixed material, which soon perish from natural disintegration, or from the conflagrations which are invited and fed by their combustible nature.

The grandest prize yet awarded to inventive genius awaits the one who will produce an artificial stone which shall be composed of elements easily attainable, which shall be durable, impervious to moisture, and capable of being easily shaped into architectural and artistic designs, and which at the same time can be afforded at a price which, while it will enable the wealthy to erect mansions and public buildings of elaborate and costly designs, may at the same time be brought within the means of the less wealthy, whose only ambition is to put up cheap, durable, fire-proof structures, at about the cost of ordinary brick.

Many processes have from time to time been suggested and a large number of patents have been secured, both in this country and in Europe, for meeting the conditions required. The records show that 28 different patents for the manufacture of artificial stone have been taken out in this country, alone, within the past fourteen years—not more than three or four of which have stood the test of practical application. Among those which seem to have met with a most decided approval we may mention that obtained a few years since by Mr. George A. Frear, of Chicago, and which after four years of practical trial, and of final crucial test in the great Chicago fire, is now presented by its proprietors in the fullest confidence that all requirements have been fully and fairly met.

A large number of massive and elegant structures have been put up with this material, now known as "Frear stone," in Chicago, and in several of our Eastern cities, and among these one of the most elegant church buildings in New Haven, Conn., which is constructed of Frear stone from foundation to turret.

The Frear stone seems to combine, in an extraordinary manner, all the elements of durability. It is free from metallic admixtures; it is impervious to moisture; it is uniform in structure and constitnent parts, and the adhesiveness of its cementation is most extraordinary, resisting alike fire, water and frost.

Its manufacture is extremely simple, requiring no machinery beyond the molds in which the blocks and designs are cast. The cementing material is simply Portland cement and shellac. This being moistened and mixed with moist sand the whole mass is tamped into a mold, when it soon sets and dries.

The simplicity of the manufacture enables it to be furnished cheaper than any other artificial stone with which we are acquainted.

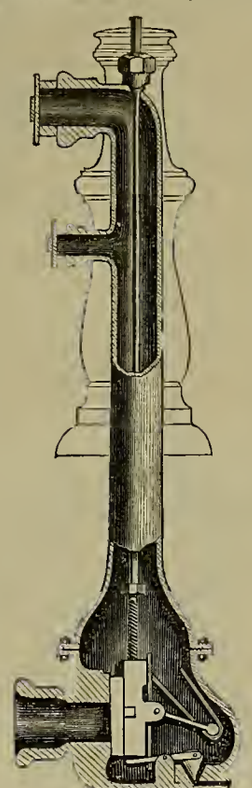
Mr. George D. Dornin, Vice President of the Fireman's Fund Insurance Company of this city, has twice visited Chicago since the great fire there in the interest of his Company. He has carefully examined this stone in the city of its birth; has seen it in all its varying conditions, use and wear; exposure to wet, frost, fire, and water under the most intense heat, and pronounces it equal to any kind of building material used in that city. This opinion, coming from a gentleman writing and acting in the interest of one of our leading insurance companies is entitled to great weight.

Commander Reese, of the United States Navy, subjected a single inch cube to a pressure of 6,000 pounds under a hydraulic press, at the Washington Navy Yard, without breaking it; this is equal to 864,000 pounds to the superficial foot, and we do not know of any architecture in this country which requires over about 30,000 pounds to the superficial foot.

We are pleased to learn that a company, comprising among its members some of our most substantial and thorough going business men, has been organized in this city for the manufacture of the Frear stone here. They have already commenced operations on Bluxome street between Fourth and Fifth, with an office at 638 Market street, where specimens of the stone can be seen, also photographs of numerous buildings which have been erected at the East wholly or in part of this material. Specimens which have been through the Chicago fire are also exhibited. We deem this enterprise one of the most important yet established in this city.

Brown's Patent Fire Hydrant.

The Brown hydrant, an illustration of which is herewith given, appears to us to possess an evident superiority over those



BROWN'S PATENT FIRE HYDRANT.

at present in use in this city. One particular advantage is that it admits a free, unbroken flow of water through curved and easy lines and no obstruction is presented. The valve or gate employed is the single disk which was recently illustrated in our columns. This gate lifts to a chamber, and out of the current of water, is easily operated and not liable to stick. The hydrant is made with one or more discharges as desired and is heavy and not liable to get out of order or be easily broken, as is the case with lighter ones.

It is stated that by actual test there is a saving of more than fifteen per cent. over the old hydrant on account of the abrupt angles in the latter and the valve opening into and blocking up the water-way.

The extinguishing of fires without the aid of engines, by means of the pressure on the street mains is always desirable when that pressure is obtainable, and in this city incipient fires are often extinguished by taking water through hose direct from the hydrant to the fire, thereby preventing disastrous results. The double discharge is an advantage in this case since if hose is attached to the hydrant, when the engines arrive more or less time is lost in detaching the hose and putting on that belonging to the engine. By the double discharge a stream may be on the fire all the time and the hydrant hose be removed only when the engine stream is under way. In view of these facts it is evident that a hydrant which, from its peculiar construction does away with a large amount of friction as does the Brown, commends itself.

An examination of this hydrant may be made by parties interested at the store of Brittain, Holbrook & Co., Nos. 111 and 113 California street.

Iron, Steel and Hardware—A large three-story fire-proof brick building has been recently erected on Market street in this city, between First and Fremont streets, by J. S. Van Winkle for the firm of Van Winkle & Davenport importers and dealers in Iron, Steel and heavy Hardware.

The lot, which was purchased for the purpose last fall, is 46x137 feet and in a good locality for the business. The building in its interior arrangements is very complete and convenient. The largest truck can drive in, receive and deliver goods with the greatest possible dispatch. The house as may be seen by reference to their card is now open for business, a full share of which it will doubtless receive. Both members of this firm are long and widely known on this coast. Mr. Van Winkle, as will be remembered by many of our old residents, started business in this city as early as October, 1849. In November, 1851, he removed to Sacramento, since which he has passed through many vicissitudes of fortune. He there put up three buildings and remained on the same lot for upwards of twenty years, being in the meantime twice burnt out with no insurance, and suffering otherwise heavily from numerous floods and losses attending the same. But reverses seem only to have given a new impetus to energy and determination, which we trust will receive the reward, they merit.

Tunnels.—Work on the Detroit side shaft of the *Detroit River Tunnel* was commenced Dec. 1st, 1871, and finished Jan. 31, 1872. The drainage tunnel from bottom of the shaft has been excavated for 130 feet. It rises on a grade of 1 in 1,000 to the center of the river and is not to be straight, but to have two short curves. On the *Hoosac Tunnel* there remained, on Feb. 1st, 1872, only 2,501 feet in the eastern part, and 4,644 feet on the western part, to be driven. Its completion is promised by autumn of 1874. An *English Channel Tunnel Company* has been registered in London to excavate a trial shaft and driftway on the English side, and, if the scheme is found practicable, to push the work on until the French shore is reached. The experimental section contemplated will cost $10,000,000.

Nevada Items.—The arrangements between the Elko and Hamilton Railroad and the Syndicate have been satisfactorily completed, by which the latter advances the bonds on thirty-three years, seven per cent. mortgage, for the construction and fitting out of the road. Work will be commenced about the 1st of July, and the road will give more convenient access to several mining districts, and will afford means to ship the ore of Treasure Hill and Eureka, which could not otherwise be transported with profit. The wagon roads from Elko to White Pine are in excellent condition. A large force of men is to be put at work on the property of the Empire City mining company in Railroad District.

The Eureka, at Grass Valley, which for many years previous to its late decadence has been the leading mine in that favored locality, is still without any new developments, notwithstanding the occasional rumors to the contrary. In the meantime the Idaho, next adjoining on the same ledge southward, has taken the place formerly occupied by the Eureka as the leading mine in Grass Valley. The improvement in this mine is creating a renewed interest in the second extension south.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

Geddes and Bertrand Mill and Mining Co. May 16. Location: Eureka District, Nevada. Capital stock. $4,000,000, in 4,000 shares. Trustees—Louis Bertrand, Samuel Geddes, S. W. Lee, M. C. Hilliard and E. A. Fargo.

Gopher Gold and Silver Mining Co.—May 15. Location: Devil's Gate and Chinatown Mining District. Capital stock $3,000,000, in 30,000 shares. Trustees—J. P. Jones, J. A. Pritchard, S. A. Raymond, B. H. Freeman and Henry Raymond.

Alta S. M. Co.— May 15. Location: Gold Hill District, Storey County, Nevada. Capital stock, $3,600,000, in 36,000 shares. Trustees—C. Jones, C. B. Land, J. L. Vanbokkelen, W. F. Meyers and M. D. Townsend.

South Comstock G. & S. M. Co.—May 15. Location: Gold Hill District, Storey County, Nevada. Capital stock $4,000,000, in shares of $100 each. Trustees—Robert Sherwood, A. K. P. Harmon and James A. Pritchard.

Leo M. Co.—May 15. Location: Gold Hill District. Capital stock $3,200,000, in 32,000 shares. Trustees—F. Schwartzchild, L. W. Wood, Wm. H. Shears, H. W. Byington and A. Staples.

Alabama and Humboldt Consolidated M. Co. May 16. Location: Storey County, Nevada. Capital stock $2,800,000, in 2,800 shares. Trustees—Charles Jones, C. B. Land, A. Fleischhacker, John Gillig and Wm. H. Watson.

Chief of the Hill M. Co.—May 16. Location: Ely District, Lincoln County, Nevada. Capital stock $3,000,000, in 30,000 shares. Trustees—J. B. Haggin, John P. Jones, Chas. L. Elliot, A. C. Kibbe and Jessie S. Wall.

Wolverine M. and M. Co.—May 16. Location: Calaveras County, and the Independence and Railroad Flat District. Capital stock $2,000,000, in 20,000 shares. Trustees—B. M. Hartshorne, W. H. Taylor, Wm. Norris, W. H. Moor and E. Norton.

Setting Sun S. M. Co.—May 16. Location: Ely District. Capital stock $2,400,000, in 24,000 shares. Trustees—M. J. McDonald, Robert Sherwood, Joseph Clark, John W. Gashwiler and E. J. Baldwin.

Victor S. M. Co.—May 16. Location: Ely District. Capital stock $1,800,000, in shares of $100 each. Trustees— John W. Gashwiler, Robert Sherwood, M. J. McDonald, E. J. Baldwin and Joseph Clark.

Black Bear and Yellow Jacket M. Co. May 17. Location: State of California. Capital stock $3,000,000, in shares of $100 each. Trustees—Thomas Bell, Thomas Fredderspoon E. N. Hooper, Joel F. Lightner and John A. Gashwiler.

Bohemian Club.—May 17. Trustees: D. P. Belknap, Henry George, Frederick Whymper, S. C. Rogers and Benjamin Napthaly. Objects—The promotion of social and intellectual intercourse between journalists and other writers, actors and musicians, professional and amateur, and others associated by reason of knowledge and appreciation of polite literature, science and the fine arts; and also the collection and preservation of records, mementoes and archives illustrating the progress of literature, science and art on the Pacific coast, and calculated to perpetuate the memory of those who have been, or shall be, instrumental in promoting such progress.

Clipper S. M. Co.—May 18. Location: Gold Hill District, Storey County, Nevada. Capital stock $3,100,000, in shares of $100 each. Trustees—M. D. Townsend, Henry Baker, A. E. Head, S. W. Lee and W. S. Hobart.

Louisville Consolidated M. Co.—May 18. Location: State of Nevada. Capital stock $2,000,000, in shares of $100 each. Trustees—A. Austin, Grove Adams, G. W. Grayson, Fred. A. Gibbs and C. J. Lansing.

Horticultural Hall Association.—May 18. Object: To carry on and conduct horticultural exhibitions, to purchase and improve real estate for the benefit of the association. Capital stock, $60,000, in 600 shares. Trustees—Robert J. Betge, Wm. Meyer, Christian Westphal, E. L. Reimer and P. A. Miller.

Pennsylvania S. M. Co.—May 21. Location: White Pine County, State of Nevada. Capital stock, $2,000,000, in 20,000 shares. Trustees—Alvinza Hayward, Andrew Jackson, Jasper O'Farrell, Robert Sherwood, George W. Cope, D. L. McDonald and J. G. Messec.

The Angel's Quartz Mining Company filed an amended certificate May 21. Location: Angel's Camp, Calaveras County. Capital stock $1,800,000, in 18,000 shares. Trustees—Wm. Maltman, Wm. A. Baker, W. R. Ward, A. N. Bell and G. J. Slocum.

The Champion Cons. G. and S. M. Co. May 22. Location: Wallapai District, Mohave county, Arizona. Capital stock $4,000,000, in 40,000 shares. Trustees—W. H. Raymond, R. B. Gray, C. J. Deering, W. H. Smith and S. L. Theller.

Dunderberg M. Co.—The number of shares in this company is 50,000 instead of 5,000 as we stated last week.

Dana's Mineralogy.—Appendix to the last edition of *Dana's Mineralogy* has just been issued. It contains 24 pages, 8 vo., and has been prepared by Prof. G. J. Brush. It contains descriptions of 87 minerals by him during the past four years.

Domestic Economy.

Mushroom Catsup.

Below we give Dr. Kitchiner's mode of making thie article, taken from his "Cook's Oracle;" Take care that they are the right sort and freshly gathered. Full grown flaps are preferred. Put a layer of these at the bottom of a deep earthen pan, and sprinkle them with salt; theu another layer of mushrooms and some more ealt ou them, and so on alternately, salt and mushrooms. Let them remain two or threo hours; by which time the salt will have penetrated tbe mushrooms, and rendered them easy to break. Then pound them, iuto a mortar or mash them well with your hauds and let them remain for a couple of days, no longer, stirring them up and mashing them well each day. Then pour them into a stone jar, and to each quart add an ounce and a half of whole black pepper aud balf an ounce of allspice; etop the jar very close and set in a stew-pan of boiling water, and keop it boiling for two hours at leaet. Take ont the jar, pour the juice clear from the settlings througb a hair seive, without queezing the mushrooms, into a clean stewpan; let it boil very gently for half an hour. Those who are for superlative catsup will coutinue the boiling till the mushroom juice is reduced to one-half thc quantity. It may then bo ealled double catsup. There are several advautages attendiug this concentration; it will keep much better, and only one-half the quantity be required, eo you can flavor sauce without thiuning it; ueither is this an extravagaut way of making it, merely the aqueous part is evaporated; skim it well and pour it into a clean dry jar; cover it close and let it stand in a cool place until next day, pour it off as gently as possible (so as not to disturb tbe settlings at the bottoms of the jar) through a tamis or a thick flannel bag, till it is perfectly clear; add a tableepoonful of good brandy to each pint of catsup and let it stand ae before; a fresh sediment will be deposited, from which tbe catsup is to be quietly poured off and bottled in pints or half pinte (which have been washed with brandy or spirits). It is best to keep it in such quantitics as are soon used. Take especial care that it is close corked and sealed or dipped in bottle cement.

Rules for Washing Dishes.

Scrape the dishes, put away any food which may remain on them, and which it may be proper to eave for future use. Put grease into the grease pot, and whatever else may be on the platee, into the slop pail. Save tea leaves for sweeping. Set all the dishes, when scraped, in regular piles, the smallest at the top.

Put the nicest articles in the wash dish and wash them with hot suds, with tbe swab or nicest dishcloth. Wipe all metal articlee as soon as they are washed. Put all the rest into tbe rinsing dieh whicb should be filled with hot water. When they are taken out lay them to drain on the waiter. Then rinse the dishcloth and hang it up, wipe the articles washed and put them in thoir places.

Pour in more hot water, wash the greasy dishes with the dishcloth made for them; rinse them and set them to drain. Wipe them and set them away. Wash the knives and forks, being careful that the handles are never put in water; wipe them and tben lay them iu a knife dish to be scoured.

Take a fresh supply of clean suds, in which wash tbo milk pane, buckets, and tins. Then rinse and hang up this dishcloth, and take the other; with which, wash the roaster, gridiron, pots, and kettles, Then wash and rinso the dishcloth and hang it up. Empty the slop bucket and scald it. Dry metal teapots and tins before the fire. Then put tbe fireplace in order, and sweep and dust the kitchen.—*Catherine E. Beecher.*

Goon Temper ann Goon Cooking.—It is astonishing how much the cheerfulness of a wife contributes to the bappiness of home. Wo remember hearing a husband say that he could guage the temper of bis wife by the quality of her cookiug; good temper even influenced the seasoning of her soups and the lightness and delicacy of her pastry. When ill temper pervades, the pepper ie dashed in as a cloud, perchance the top of the pepper box ie included, as a kind of diminutive thunder bolt; the salt is all in lumps and the spices seem to betake themselves all to one spot in the puddings, as if dreading the frowniug face above them. If tbere be a husband who could abuso the smiles of a really good tempered wife, we should like to look at him! Among tbe elements of domestic happiness, the amiability of the wife and mother is of tbe utmost importance—it is one the of best securities for the happiness of home.—*Ohio Farmer.*

Fire Kindlings.—In France a very convenient and ecouomical kindling is made by dipping corn-cobs for about one minute in a hath composed of 60 parts melted resin and 40 parts tar. They are next sproad out to dry on metallic plates, heated to the temperature of boiling water. They are then assorted, according to size, and tied up in bundles. They sell for 1 to 2 centimes (⅕ cent) apiece. Tho "Compagnie des allumettes landaise" employs 30 workmen and makes about $40,000 worth a year.

Helpful Hints for the Household.

Rice Cakes.—One pint of boiled rice, a teacup of flour, two eggs, a small spoonful of butter, a teaspoonful of salt, and milk sufficient to mako a muffiu batter. Bake on a griddle. Served hot. Eat with butter and powdered sugar.

A Goon Custarn.—Upon five eggs, well beaten, pour oue quart of milk scalding hot, etirring all the time; sweeten to taste; flavor with lemon or nutmeg; bake twenty minutes in an oven at a moderate heat. A custard made in this way is superior to one made of eold milk, as the taste is richer, and it does not "whey."

Crisp Muffins.—One pint of sifted Iudian meal.

One pint of milk or cream.

Two eggs.

A teaspoonful of salt.

A spoonful of butter or lard.

Drop the batter in a hot, greased pau or oven by spoonfuls, taking care that your muffins do not touch. Let them bake till crisp and brown.

Soft Ginger Cake.—One egg, one cup of molasees, epoonful of ginger, one eup and a half of sour cream, one beaping teaspoonful of soda, and flour for rather a thin batter.

Sugar Cookies.—One cup of butter, one eup of sugar, three eggs, one teaspoonful of soda, half a nutmeg grated; roll thin and bake in a quick oven.

Velvet Cream.—One half ounce isinglass dissolved in one and a half cups of white wine, to which is added the juice and rind of one lemon and three quarters of a pound of white sugar, Simmer till mixed; strain and set to cool. Add a pint aud a half of rich cream, and stir till quite cold; then set in molds on the ice till stiff as blanc mange. Orange peel and juice are finer than lemon.

Plain Cream.—One quart of sweet milk, one eup of cream, one coffecup of sugar, or less if you prefer, boiled with a piece of orange peel, or flavored with almond. Moieten four spoonfuls of sea moss farina with cold milk, and stir into a boil. Two spoonfuls of rose brandy is a delicious flavor for this cream. Stew any juicy fruit nicely, sweetening right, and when boiling stir in a spoonful of corn starch wet in eold wator for every pint of juice. This gives a jelly-like appearance and clearness to the fruit without impairing the fruit in any way. While only a moderate quantity of sugar is used, the juice has almost a candied look. Cranberries, barberries, and such sour fruit are improved by it. If the juice is strained, the corn etarch addition will make a very tolerable jelly, much pleasanter than the isinglass jellies. This must be poured in flat glass dishes to the depth of half an inch, and cooled. When firm, pour on the cream, let that stand, and add another layer of fruit. This will be found a delicious substitute for pies in summer when pastry is too rich to be eaten.

Wood Fires.

We often wonder why in an age abounding in inventions for household comfort, the oldest and best of all—a wood fire on the hearth—has almost disappeared. It cannot be on the ground of its greater expense, for that is not a trifle compared to luxuries which we see everywhere. Scrupulous housewives, we believe, object to it as untidy. But from sucb pharisaic regard of the outside of the cup and platter, may we be delivered! Now, in the first place, nothing keeps the air of a room so fresh and sweet as an open wood fire. Its advantage in point of healthfulness over ordinary ways of warming are immense. For a room of ordinary size, in this elimate, it gives amply sufficent heat. And what a wonderful promoter of cheerfulness it is! It is as much bettor thau the open coal fire than that is better than the black hole in the floor called a register. Its voice, as it purrs and crackles and roars, is enough to drive away the worst fit of the blues. Its mountain flames give the cheapest light in tho world. The depthe of its glowing coals continually allure and charm the eye. Thero are not many human beings who are as good company for every mood. After the day's work and fret it brings calm and cheer—whiles away all troubling thoughts. If the mind is at work, its unobtrusive companionship sooths and aids. When ono is weary, he may find restful occupation in watching the freaks of the flames, and listening to their changeful voice. It brigbtens people and brings them together. To what scenes of friendship and social enjoyment does it lend a uniquo charm! It is the luxury of luxuries, a thing without which lifo is incomplete.—*Beecher.*

How to Keep Cheese.—A good way to keep cheese from moulding or getting too dry is to place it between two wooden bowls and put them in the coolest, darkest corner of the cellar. We bought one last Novemober weighing nearly forty pounds, and treated it after the above method; what there is loft of it at the present time (April 19th) is moist and good; not an ounce has been wasted because of mould. Perhaps otbers may bave a better way. If so please let us hear about it. I am perfecly eatisfied with our way. The experiment was purely an original one and the test was satisfactory. The wooden bowls want to be largo enough to encircle the cheese, and the edges must meet, not tightly, but so air can circulate slightly around the cheese.—*Ohio Farmer.*

Porcelain Wash-Tubs.

In a private letter from a lady residiug in Brooklyn, N. Y., to a correspondent of the Press, a bit of useful information relative to the new porcelain waeh-tubs, is extracted for our columns: "Several of tho wealthy families of Brooklyn, one in particular residing at Montague Terrace, have introduced into their dwellings these new stationary tubs; they are modols of convenience in washing, and save an immenso amount of work; a large washing is done in a great deal less time than by the use of other tubs or inventions; they are very expeneive but very conveuient and a great improvement on other labor-saving washiug apparatus."

In the *Mechanic and Inventor* we find a short allusion to this new invention. It corroboratcs tbe statement of the lady, and gives a little additional as follows: "An importer of erockery ie dreaming of a fortune from the eales of "stationary wash-tubs" made of porcelain, each baving a currugated inclinod side for a rub-board. The porcelain tubs are about as large ae the ordinary wooden stationary tubs. They are among the neatest of household appliances; yet tbe prices asked for them are beyond all bounds of reason."

Something New for the Kitchen.

One of the slowest and moet tiresome operations of the kitchen is tho beating of eggs; and wheu the work is supposed to be thoroughly done in the usual manner, the eggs are far from being in the best condition for uee. Eggs, when properly beaten, should be thoroughly aerated—a condition which cannot be secured by the ordinary spoon or knife process in ten timee the space of time in which they can be perfectly aerated by the device herewith sbown. A single egg, when properly beaten, ought to fill a good sized tumbler. In such condition two eggs will go as far, in making cako, etc., as three when beaten in the ordinary manner. Neither milk uor any otber liquid can be thoroughly mixed with egge until they are properly beaten—reduced to a perfectly aerated mass, of uniform consistency. For bread, cake or custard the air globules should be so finely divided ae to be barely discernable by the naked eye. The work can be thoroughly done by this device in from one-fifth to one-tenth of the time ordinarily required.

Various devices have been presented to the public for beating eggs, but nothing, we think, equal to the one herein shown. This, in fact, is the ouly aerating device ever made, and ie very properly called the "Aerating Egg Beater."

This beater, ae will be seen by reference to the engraving, is simply a tin can with a coue bottom and a cone dasher, the lower portion of the dasber being perforated with very small holes, as shown. Under this arrangement the upper portion, when forced down, fills with air, which is forced through the egg, thereby finely dividing and thoroughly aerating tbe mass. This useful little kitchen device can be had of Wiester & Co., on New Montgomery street, in this city, who are aleo the authorized agents for selling territory for the patent on the Pacific Coast.

Little Conveniences.—Being at the house of a farmer in the extreme western portion of the State not long since, we opened the stable door, which tbe wind blew back upon us. Turning to find something wherewith to fasten it back, lo! thero was a hasp and staple for that very purpose! Only one farmer in fifty is thus thoughtful about littlo mattere; one in ten perhaps, would have had a loose rock or a prop for this purpose. But how mueh better is the hasp and staple, always in place and of little cost. Glancing about tho stable and shed, we found everything else in just this neat, thorough, perfect order. Everything in its place, and there were lots of little handy fixings and conveniences to save steps or to save work.—And these are the things that, summed up, give dignity and importance and value to life. It is the part of wisdom to provide them.

How to Make Rugs.—A little western girl, thirteen years of age, tells the *Kansas Farmer* how she made a cheap and pretty rug. She says:—I took a piece of fine fence wire and a file and made a crochet hook. I then got a coffee sack and cut it out square and hemmed it; then I took some cloth and tore it into strips like carpet rags. I then took my hook and a strip of cloth, and held the cloth on the under side and stuck the hook through the carpet sack, catching the cloth and drawing it in a little loop on the upper side. In my rug I have made a basket of flowers, and for a border I made a row of scollops.

Parsnips.—Boil with the skins on, then peel and cut in transverse slices and drop into a cream gravy, in whicb let them simmer on tbe stove a few minutes.

Another way is to boil and mash tbem, and moisten with milk or tbin cream, or boil, peel and set a few moments in a hot oven to brown a little.

Warmed-over Potatoes.—Chop cold boiled potatoes; put them in a dripping-pan, or earthen or stone baking dish. Pour over them a gravy, made after the above receipt, and let them bake slowly in the oven an hour or so. A delicious dish.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISOO.

Manufacturers and bave constantly on band

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We bave been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for tbs superiority of our products over all others.

We also call attontion to our

HERCULES POWDER,

Which combines all the force of otber strong explosive now in use, and the lifting force of ths BEST BLASTIN POWDER, thus making it vastly superior to any otber pompound now in use.

A circular containing a full description of thie Powder can he obtalned on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

Dupont's Gunpowder, Safety Fuse,

—AND—

WINCHESTER REPEATING ARMS.

DUPONT'S Superior Mining Powder (saltpstre), F-FF-FFF.

DUPONT'S Blasting Powder, in air-tigbt corrugated Iron Kegs, C-F-FF-FFF.

DUPONT'S Celebrated Brand, Diamond Grain, Nos. 1 2, 3 and 4, in 1 lb. and ½ lb. canisters.

DUPONT'S Unrivalled Brands, Eagle Duck and Eagle Rifle, Nos. 1, 2, 3, in half kegs, qr. kegs, 5 lb. tins, and in 1 lb. and ½ lb. canisters.

DUPONT'S Standard Rifle, Fg-FFg-FFFg, in kegs, half kegs and qr. kegs, and in 1 lb., ½ lb., and ¼ lb. canisters.

DUPONT'S Superior Rifle, A. F. & Co., F-FF-FFF, in kegs, half kegs, qr. kegs, and in 1 lb., ½ lb. and ¼ lb. canisters.

DUPONT'S Cannon, Musket, Meal and Fuse Powder.

EAGLE SAFETY FUSE (manufactured near Santa Cruz, Cal., by the L. S. & P. Co.) Constantly on hand full supplies of their Celebrated Brands, Waterproof and Submarine, Triple Taped, Double Taped, Single Taped and Hemp Fuse. Fuse made especially to explode ths Giant Powder and Hercules Powder Caps.

The above named Fuse are warranted equal to any made in tho world.

WINCHESTER REPEATING ARMS (Henry's Improved) and FIXED AMMUNITION.

A large and complete stock of thsse celebratsd arms constautly on band, to wit:

Repeating Sporting Rifles—Olled Stocks.

Repeating Sporting Rifles—Varnished Stocks.

Gold, Silver and Nickle-platsd Rifles—beautifully Engraved.

Repeating Carbines—Olled Stocks.

Repeating Carbines—Gold, Silver and Nickel-Plated and Engraved.

Muskets—Angular or Sword Bayonets.

Full stock constantly on hand of all the different parts of the Winchester Arms.

Cartridges in cases (Brand H), manufactured by th W. R. A. Co. expressly for thsir arms.

A full and complete stock of the ahove namsd merchandise always on band and for salo by

JOHN SKINKER, Sole Agent,

THE TANITE COMPANY,
STROUDSBURG, PA.,
Sole Manufacturers of
THE TANITE EMERY WHEEL,
And builders of Emery Grinders, Saw Gummers, Etc., Etc.
Emery Grinding Machines,
At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.
SOLID EMERY WHEELS,
From 40 cents to $113 each.
Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

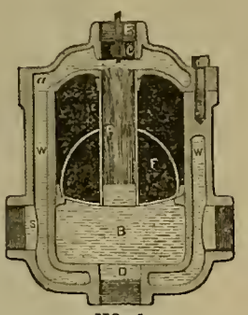
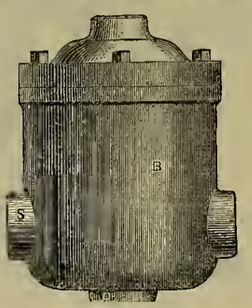
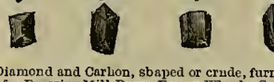
CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.



NO. 1.
The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.
The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.
The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.
The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.
The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

DICKINSON'S
Patent Shaped Diamond Carbon-Points.
Fig.1 Fig.2 Fig.3 Fig.4


Diamond and Carbon, shaped or crude, furnished and set for Dressing Mill-Burrs, Emery-Wheels, Grindstones, Conglomerate, Drilling Rock, Sawing or Working Stone, Truing up Hardened Steel, and for other mechanical purposes. STEPHENS & CO.,
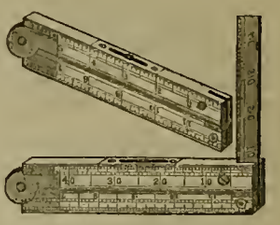
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workman, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*

H & L AXLE GREASE.

The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by
HUCKS & LAMBERT.
The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus
Relieve the Draft of the Team,
Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as
LOW A RATE
As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.
HUCKS & LAMBERT
Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Address all orders (wholesale or retail) to

DEWEY & CO.,
Scientific Press, 338 Montgomery street, San Francisco.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

CAUTION AGAINST FRAUD.

Declared by Connoisseurs to be the only good SAUCE The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper

Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, Loudon, &c., &c., and by Grocers and Oilmen universally. 15v24-eow-tf

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

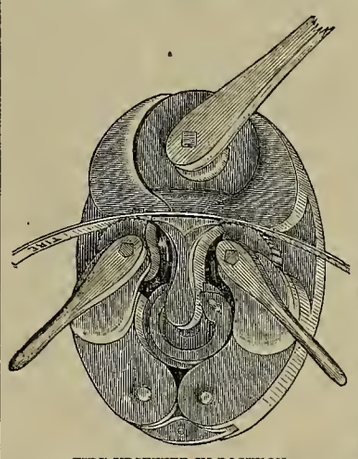
Wheelwrights and Blacksmiths, Attention!



TIRE UPSETTER IN POSITION.

TIRE UPSETTER!

The Only Successful One Yet.

HUGHES' PATENT.

We call attention to the following Certificates from parties who have used our Machines, and CHALLENGE COMPARISON, side by side, with any other Upsetter, EITHER FOR LIGHT OR HEAVY WORK.

Extracts from Testimonials.

We have had a Hughes Improved Tire Upsetter in use for about three years, and in all that time have found it a most valuable Machine for the purposes for which it was intended. It is strong, not liable to get out of repair, upsets the tire well without making any bulge to be hammered out, and without disfiguring the tire in any way. It is quickly adjusted to any size of tire, and entirely does away with any necessity for cutting and welding. * * We give it a hearty recommendation to others in the Wagon and Wheelwright, or Blacksmith business, and feel that we cannot speak too warmly in its favor. It is a first-rate success.

Yours, very truly, SAUL & CO.,
Nos. 7 and 9 Powell street, San Francisco.

STOCKTON, March 16, 1872.—This is to certify that we have used the Hughes Tire Upsetting Machine for three years, and can recommend it as a first-rate Machine for fitting heavy Tires. WM. P. MILLER.

We also refer to JOHN DUPUY, 523 Broadway st., S. F.; BERNHARD GALLAGHER, 222 Mission st., S. F; KIMBALL & CO., cor. Fourth and Bryant sts., S. F.; LARKIN & CO., 631 Howard st., S. F.; T. D. LAMER, N. E. cor. Seventeenth and Valencia sts., S. F.; CUNNINGHAM & PARKER, 654, 656 and 658 Howard st., S. F.

With this Machine two men can upset the heaviest Tire in a few seconds after the Tire is heated. The strength of a child is enough to operate it. There are no nuts, bolts, or screws about it to break.

PRICE $50 GOLD COIN, delivered in San Francisco, ready for use or transportation. If the Machine is found not to do its work well, we will refund the price.

CUTTER & CO.,

Sole Proprietors and Agents for all the States and Territories west of the Rocky Mountains.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Orystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for style of frames sent to any address free.

☞ Pebbles sold as such by us, are Warranted.

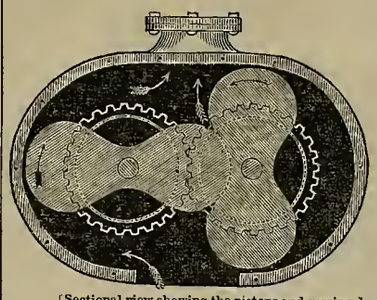
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,



[Sectional view showing the pistons and gearing.]

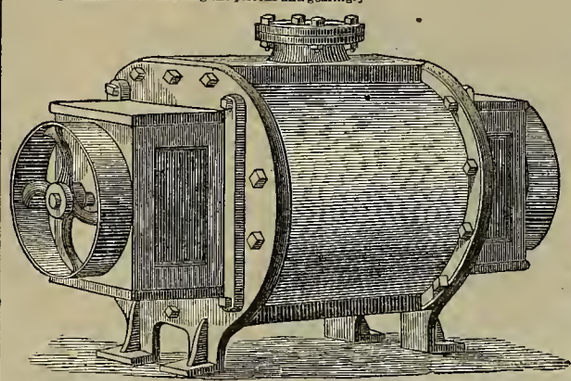
MANUFACTURED AT THE

GLOBE IRON WORKS,

Stockton, Cal.

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

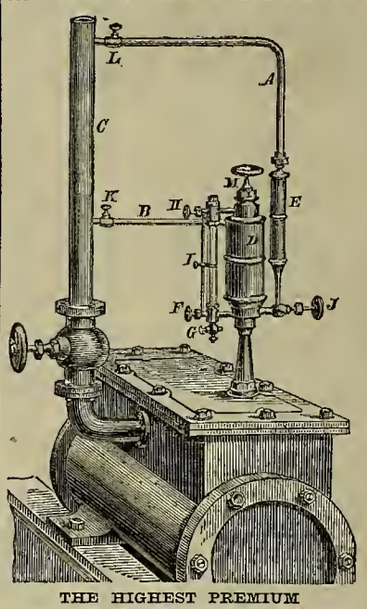
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe D into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

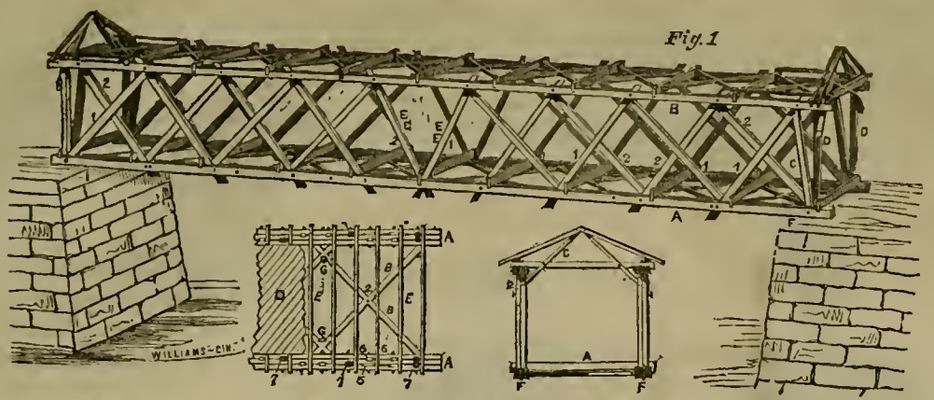
PACIFIC BRIDGE COMPANY,



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

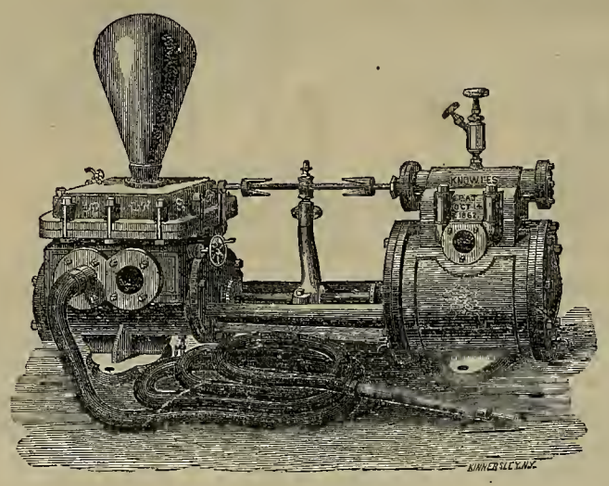
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal, (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

A11
3-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11¼ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND
THE LARGEST STOCK OF PUMPS IN THE WORLD,
And for Every Conceivable Purpose.

A. L. FISH, Agent.
No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

---

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a Silver Medal, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, OHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding*. Hooker's Hand Pump was the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,
TREADWELL & CO.,
Market Street, corner of Fremont, San Francisco.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. Williams, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

VOLUME XXIV. Number 22.

The Danks' Puddler—Unexpected Difficulty.

A practical trial of the Danks' Puddling Furnace was lately made in England, under the immediate supervision of the Iron Master's Council, in which the machine, after several trials, received the general approval of the Council, while all doubt of its success, if any existed, was finally removed. One or two gentlemen expressed some doubt as to whether the machine would be able to produce iron of the quality required for the finest of the Staffordshire brands of manufacture; but it was freely admitted that there was no doubt about its being perfectly fitted for a large part of even such exceptional work; while for the production of iron generally, it was all that could be desired.

All this gratifying approval, however, was soon after suddenly chilled by the information conveyed to Mr. Danks that the iron masters had been examining into the validity of his patent, and found that it was invalid; but the reasons upon which their opinion was based were not revealed. The supposition, however, is that the conclusion was reached that there was a lack of novelty in the machine, which would be fatal to the stability of the patent. How such an opinion could be arrived at in the face of the universally admitted fact that no other inventor had been able to reach any practical degree of success, it is difficult to understand.

The iron masters notified Mr. Danks that in consequence of this conclusion they had decided not to ratify the preliminary agreement, in which it promised to pay the inventor $250,000 for the privilege of building 200 of his furnaces, but that they would graciously consider his case and secure him such award for his invention as he might be morally entitled to at the hand of the associated iron interest, which would be so largely benefited by the practical value which his genius had added to the inventions of others.

The committee, in return, were politely assured by Mr. Danks, that in case their declaration was persisted in he should take active measures to secure his rights against all infringers, and that any subsequent arrangement with the iron masters would have to be made on a different and less favorable basis than the one which they proposed to repudiate.

There appears to be a very general feeling among the masses of even the iron men, that injustice is intended towards the inventor, and the wish is freely expressed that he may finally receive a full and ample reward for the great benefit which must certainly accrue from this important invention. All inventors must certainly wish him the fullest success in the contest which thus seems to be precipitated upon him in the very hour of his success.

THE FIRST COAL ever mined in the United States was dug up near Richmond, Virginia. Bituminous coal was mined there as early as 1700, and in 1775 was extensively used in the vicinity. During the revolution a Richmond foundry employed this coal in making shot and shell for the use of the Continental forces.

PROFESSOR ALBERT HOPKINS, Professor of Natural Sciences at Williams College, Mass., died on the 24th ult. He was the brother of President Hopkins, who recently resigned his position in that institution, and was well known in the scientific world.

Hungerford's Improved Water Wheel.

This invention is intended to provide an improvement in turbine or other water-wheels, and consists in a novel arrangement of one or more adjustable gates, through which water is admitted to the wheel. These gates are curved and can be operated by a screw rod and nut so as to regulate the amount of water admitted to the wheel, according to the amount of fall of water and the power required to be exerted by the wheel.

Figure 1, is a side sectional view, and figure 2, a plan. *A*, is the central shaft to which the wheel, *B*, is secured, and *C* is the outer inclosing case, water being admitted through the passage, *D*. *E* is a circular disk or plate, extending around the journal of the shaft, *A*, and forming the upper side of the chamber or case in which the wheel, *B*, revolves. The sides of the case are formed by adjustable curved gates, *F*, which in the present case are three in number, as shown. These gates are formed in a curve, commencing at the outer or movable end, and drawing gradually nearer to the wheel until at the extreme inner end they are secured by a lug, or ear, *a*, to the top and bottom of the case, so as to keep its extremity to its place at all times.

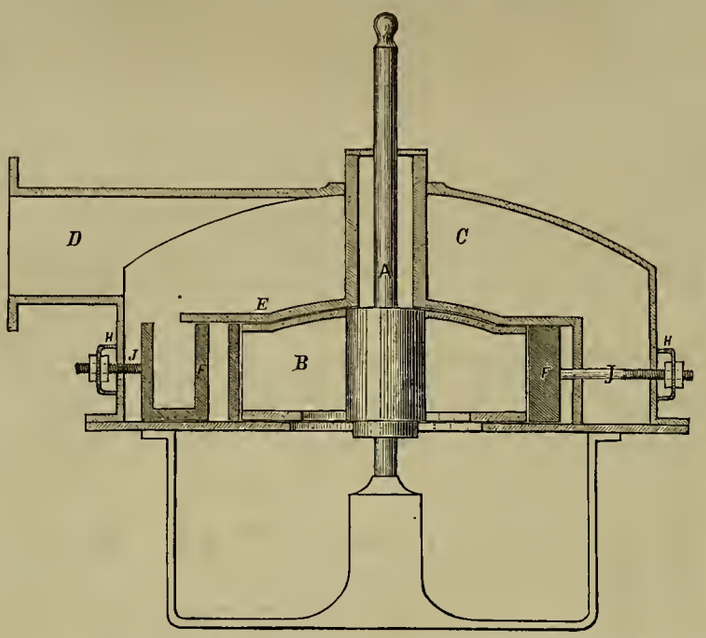

FIG. 1—HUNGERFORD'S IMPROVED WATER WHEEL—SECTIONAL VIEW.

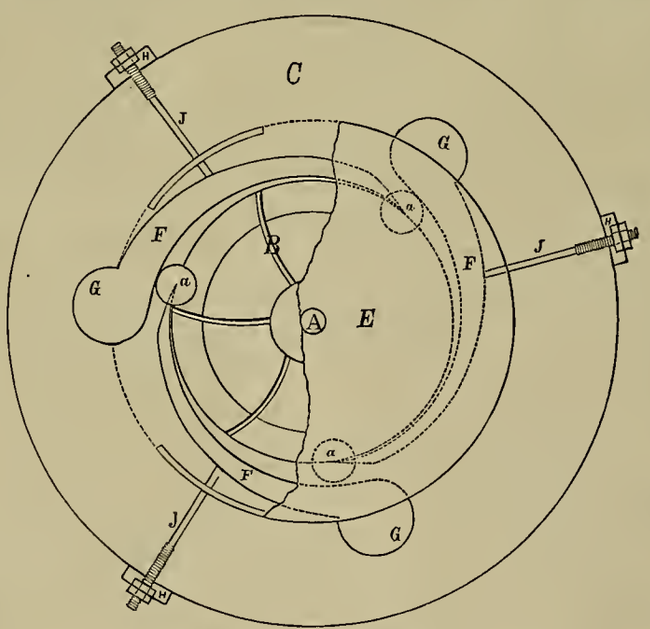

FIG. 2—PLAN OF WHEEL.

The outer or movable end of these gates has a motion about the pivot, *a*, in their adjustment, so as to allow their movable ends to be brought nearer to, or further from, the periphery of the wheel. The outer end of each gate is cylindrical in form, as at *G*. In order to open or close the gates, a screw rod, *J*, passes from each gate to the outside of the casing, and a suitable nut, *H*, operates the rod, thus moving the gate as shown.

The operation will be as follows: water being let in through the supply passage, *D*, will rush in through the passages formed by the position of the curved gates, *F*, and striking the wheel will cause it to turn.

These adjustable gates are employed to contract or enlarge the water passage leading to the wheel, according to the head or fall of water to be obtained, as by reducing the size of the water passages, and consequently the amount of water admitted to the wheel, in proportion as the highth of fall is increased, the power of any given amount of water can be proportionately increased.

This invention has been patented, through the SCIENTIFIC PRESS Patent Agency, by Morgan Hungerford, of San Francisco, Cal.

ARIZONA AFFAIRS.—General Howard has, after a very short experience among the Apaches, given General Crook permission to deal with them as they deserve to be dealt with. In his order to Gen. Crook, he says that his office as special Commissioner was to make one more effort to settle all trouble peaceably, but since the murders and robberies still continue, there is no course left but to deal with the Indians with vigor until they are made to feel the power of the Government. The order is a sensible one and was no doubt very acceptable, not only to Gen. Crook but to all the inhabitants of the Territory, Gen. Howard, like every one else who ever went to Arizona has been able to see the Indian question in its proper light and shows his good sense in throwing the discretionary power given him by the authorities, on the right side. In a speech made by him he declares that his views as to the proper military course to be pursued in Arizona are almost identical with those of Gen. Crook. His mission to Arizona was not to prevent war upon hostile Indians, but to enforce the treaty provisions on both sides, settle the good Indians upon reservations, and enjoin obedience to the laws.

It is to be hoped now that Gen. Crook has the proper authority to pursue the course he chooses, that he also possesses the requisite force of troops, etc., to carry out his views since they will no doubt be congenial to the people of the country. We hope to hear shortly of a cessation of the robberies, murders and other outrages committed upon citizens of the United States by the red skins, for the efficient commander will doubtless make short work of the Indians concerned in them.

The Future of the Pacific Coast.

When Sir Isaac Newton, the greatest of modern philosophers, lay at the point of death, his friends, assembled at his bedside, were grieving at the loss the world would sustain by the death of so great a man; the dying philosopher, observing their emotion, and comprehending the cause uttered these memorable words: "Weep not for me my friends, I am but as a mere child upon the sea shore picking up pebbles, compared to what those who come after me will be able to accomplish. I am but at the doorstep of knowledge." And thus it is ever. Compared to the possibilities of those who succeed us we are but mere children upon the seashore picking up pebbles. We are only at the doorstep of knowledge, intelligence and power. Those who came to California early were, it is true, blessed with opportunities of a high order, but, compared to those who came after them, and those who will come in the future, they were but as children upon the seashore picking up pebbles—at the doorstep of intelligence and power.

The Wealth of the Future.

Let us estimate the aggregate of the wealth of the inhabitants of the Pacific Coast in 1860; what was it as compared with the aggregate of the wealth of the inhabitants of this coast in 1870? Look at the increase of wealth of San Francisco, alone, in those two years. Contemplate the vast area of streets that has been opened and the multitude of solid, substantial buildings that have been erected in those ten years; and behold it, to-day, in spite of the financial depression that we have recently experienced, occasioned principally by the great drought from which our mining and agricultural regions have suffered. Contemplate, too, the great increase in all the elements of wealth to be found in the numerous cities, towns and villages, that have sprung into existence on this coast in the past twenty years; the railroads, canals, tunnels, etc., that have been constructed in the past few years, and think what the next twenty years will do for us, with the vast lines of railroads that are already built, or in course of construction, and in contemplation. Who is he that has prescience enough to estimate what will be the aggregate of wealth of the Pacific Coast in the year 1900, when the Central Pacific and the Northern and Southern Pacific railroads shall have developed the hundreds of now barren wastes, that will then be noisy with the active millions of people that will then populate the vast cities, towns and villages that will meanwhile spring into existence all around them?

The Improvements of the Future.

Independently of these, who can estimate the value of the millions of acres of now unproductive lands that shall be opened up to our farmers by the immense net work of railroads and canals which shall be constructed in all parts of our State by that time? Think of the vast benefits which our miners and agriculturists will realize from the completion of the numerous works now latent in the minds of some modern DeWitt Clintons. The numerous projects such as Lake Tahoe; the irrigation canals, that will make our adobe lands prolific, in spite of droughts; the millions of tule lands that in a few years will be reclaimed and yield never failing and abundant harvests. Think of the vast mines of wealth that will flow into the coffers of our manufacturers when the thousand and one industries that now are unthought of on our coast are in active operation, and that shall check the mighty export of our precious metals to procure their supply from other parts of the civilized world. Think of the immense lines of steamships that shall bring the commerce of China, Japan, and the islands of the Pacific, and even India, to our doors. The barriers of prejudice and ignorance are rapidly falling before the silent but overwhelming approaches of commerce and civilization.

The Men of the Future.

All that we need is men, not mere humans, dwarfed by prejudice and ignorance, but men who have large brains and comprehensive intellects to grapple with the mighty problems now waiting to be solved. Not men like the Chineso, who will build a great wall to keep out civilization, and the arts and sciences, and allow the surrounding natives to progress while they are dormant and slothful. Men who will not allow their "lights to be hid under a bushel," but will "let them shine before men." Men whose reputation for intelligence, industry and integrity shall be known to the furthest confines of the earth; men who while they have intelligence to conduct gigantic enterprises and manufacture goods that shall flood the markets of neighboring countries, shall realize the value of the printing press in heralding their achievements to the uttermost parts of the earth. Men who shall appreciate the advantages of enterprises like ours and aid them, and avail themselves of its benefits, and make the manufactures of the Pacific Coast what the manufactures of Birmingtou, Sheffield, Manchester, London, Liverpool, Paris, Antwerp, New York, Boston, Pittsburgh, etc., have done for theirs. All it wants is men like these. Shall we have them?

The Vintage of 1871.

The following article from the *Commercial Herald and Market Review* of the 10th inst., is written by one of the best posted wine dealers in the State, and, as will be seen, fully sustains the estimates of the Wine Growers' Association:

Enough reliable data has reached us at this time from the various wine counties of the State, to make a very close estimate of the total amount of wine made during the last vintage. While the grapes were coloring, various experts supposed that the product would reach eight million gallons, from the fine appearance of the vines, which were overcharged with grapes; but the ravages committed by the grasshoppers and sun-blast in the lower, as well as some of the mining counties, far exceeded their expectations, and diminished by more than a million and a half gallons what could have been reasonably expected. Various estimates have since been made as to the entire yield, some of which are unfortunately far above the mark; while others, just as unfortunate and more damaging in their influence, belittle the amount, through gross ignorance. In this latter connection, we allude to a wine article that appeared in the *Alta* on the 2d of this month. The writer sets forth his belief that no more than four and a half million gallons were made last vintage, and gives the puerile reason for the statement that only 800,000 gallons of the previous vintage was exported, that only 1,300,000 gallons were brought to the city, and that therefore, in his opinion, there was not 5,000,000 gallons of surplus, or, to use his own words, "or anywhere like it." These statements were made in the face of the printed report of the Committee on Statistics of the Wine and Brandy Growers' Convention of Sacramento, who placed the yield at 6,000,000 gallons. This convention had representatives from every prominent wine county in the State, and every prominent wine-grower in the State was represented, at least by a neighbor, if not present himself. The committee carefully gathered from each of these representatives a close estimate of his individual district, and submitted the sum total to the convention, which was adopted, after reading, and became embodied in their pamphlet. The proposition to set aside a report gathered under such favorable auspices, by the opinion of a single person, who is no authority on the subject, is simply preposterous.

All the more recently gathered information confirms the estimate of the Sacramento Wine Convention, that the last vintage fully reached six million gallons of wine. This information more than verifies their statements concerning brandy, and in all probability they will be fifty thousand gallons under the real amount distilled at the time the convention met. In careful estimates made from actual yields of a number of individual vineyards, we have found that the lowest yield was four gallons to every seven vines which were six years old and over—this being the average in Santa Clara, portions of Napa, Santa Cruz and Sonoma counties. In Sacramento, El Dorado, portions of Napa, Solano, Stanislaus, San Joaquin and Amador counties, the yield was one gallon of wine to every two vines. In Los Angeles county, in fair years, the yield is three gallons to every five vines. Now, in the Sacramento Convention it was admitted as a fact, that there were in the State fifteen million vines in full bearing—that is, six years old; and taking the lowest produced average for last year for only these fifteen million vines, we ought to have made eight million seven hundred thousand gallons of white and red wine. Deducting from this one and a half million for the losses in Los Angeles; another half million for losses in the mining counties, and seven hundred thousand for distillation, we still have six million gallons left, with fifteen millions vines from five years to one year old, to furnish us with all the grapes we may have used for the table. The yield of these latter fifteen million vines, estimated from their respective ages, would be over twenty-one million pounds, giving thirty pounds of grapes to every man, woman and child in the State for eating.

New and Curious Building Materials.

To make planks out of sawdust has hitherto been regarded as equally feasible with spinning ropes out of sand. However, the manufacture of planks out of sawdust is now unquestionably possible, though we do not say economical; still the operation by which this might be accomplished, slightly varied, yields products not only curious but economical, and some of them, we believe, are destined to find large application as building materials.

The chemical material lignine, or cellulose, (woody fibre) was regarded until quite recently as insoluble; but it has been discovered that the fluid "*cupro ammonium*" dissolves woody fibre with great facility. There is good reason for belief that materials built up by taking advantage of this curious solvent property of cupro ammonium will before long be turned to great practical use, by effecting, however, not complete, but partial solution. Thus, to take a simple case, a sheet of paper could be rendered waterproof by being dipped momentarily in cupro ammonium, then passed between rolls to squeeze out excess of moisture, and finally dried. Such paper might be made into a bag and filled with water, and would not allow any fluid to come through except through such apertures as all paper invariably possesses. Hence to treat a single thickness of paper for the sake of waterproofing it is of little use; but if two thicknesses be dipped momentarily in the bath and then passed face to face through rolls, the two surfaces adhere so absolutely that, after drying, the plane of juncture is invisible and cannot be rendered visible by dissection. Moreover as the chances against the exact correspondence of two apertures in the two opposite sheets are almost infinite, a waterproof bag could be made.

What can be effected on two sheets can be effected on any number, and thus artificial lignine sheets may be built up of any thickness, from that of paper to that of plank or scantling if desired. The material, when in a certain state of moisture, molds with almost the same facility as potter's clay. It readily corrugates, either by fluted rolling or by rectangular pressure, and the corrugated material, extremely light, hard and almost indestructible chemically, is destined, we believe, to supplant corrugated iron in numerous applications of the latter. Water has no effect on it, and acids but little; in fact, the only agent which they cannot stand is ammonia.

It is a noteworthy fact that although cupro ammonium rapidly dissolves lignine, yet the first result of immersion is a strengthening of the fibre. A piece of linen, for instance, after being dipped for an instant in the fluid, has a greater cohesive force than it had before. This result appears to be due to a contraction of the tissue by the chemical action, and, suggests comparison with the curious accession of strength imparted to paper by instantaneous dipping in concentrated sulphuric acid, although a more prolonged immersion destroys the same paper.

Fabrics of great tensile and cohesive strength may be prepared by alternating canvas with paper or canvas with canvas. Thickness for thickness, we do not think that any timber can equal the strength of these compound fabrics. For building purposes there are numerous applications. For roofage the very thinnest double tissue paper would be both water and wind-tight, and nothing would be gained by using thicker material, except for providing against the casualty of snow and other extraneous weight. We have, however, seen a specimen made of six thicknesses of common brown paper and corrugated, which seems stout, strong and reliable enough to be proof against all ordinary casualties. As regards ornamentation, the natural tint of some of these cupro ammonium lignine structures is very elegant, and they readily take any sort of paint.

Many other utilities will suggest themselves. Among these the manufacture of tubing is important. Possibly the material may be turned to good account in hat-making—probably in boot making. We have even seen a waterproof paper cape, the only obvious defect of which was a trifle too much of rigidity.—*Condensed from Engineer.*

Shipping Wheat in Bulk.

There is an exceedingly onerous tax upon the grain growers of this State, which is not felt by their more favored co-laborers of the Atlantic States, and which annually eats largely into the profits of the California producer. We allude of course to the use and cost of sacks, to be given away with the sale of the grain. A farmer in the Atlantic States would no more think of giving away the sacks in which he delivers his grain, than he would his wagon that carries both sacks and grain to the market; and there is no more reason for his doing it.

There should be erected along the lines of the railways, and at all interior shipping ports, contiguous to grain producing districts, convenient repositories for the storing of the grain in the country in bulk, and where farmers can deliver it by the wagon load, retaining their sacks. Cars and water transports should receive the same and again deliver it in bulk at different grain-loading elevator stations; and here again, ships should receive it once more in bulk, as is done at all the ports of the Atlantic, for shipment to foreign countries.

It is idle talk, to say that grain cannot be shipped from California in bulk. It has been done successfully, and can be again, and the sooner a united and determined effort is made by our farmers, to provide a remedy and utterly throw off this sack-parasite that annually fastens with such expensive effect upon their purses, the better it will be for them.

A unity of action is required, and we know of no better way to bring it about, than to have a conference of the different Farmers' Clubs throughout the State as proposed by the Contra Costa Club, in this number of the RURAL, and unite upon some effort or action, either to break up or act independently of the sack "ring," that would control the market and exact their own prices.

Whiskey from Tule.

The pith or spongy, central part of the Tule, is found by analysis to contain gluten and starch in large quantities, whilst the green outer covering abounds in albumen. These substances all possess the constituents of alcohol, and are easily convertible into that material by the requisite means and process.

The ripened, but not dried tule, after being minutely divided by suitable machinery, is subjected to boiling in dilute sulphuric acid, which converts the starch and other sugar-producing constituents, into glucose or uncrystallizable sugar—molasses—which being diluted with water to the proper degree, a ferment is added which brings out or produces the spirit by the common process of fermentation; the mash is then distilled in the ordinary way producing tule whiskey.

POWDERED COAL FOR UNHEALTHFUL PLANTS.—In a communication addressed to the *Revue Horticole*, the writer states that he purchased a very fine rose-bush, full of buds, and, after anxiously awaiting their maturing, was greatly disappointed, when this took place, to find the flowers small, insignificant in appearance, and of a dull, faded color. Incited by the suggestion of a friend, he then tried the experiment of filling in the top of the pot around the bush, to the depth of half an inch, with finely pulverized stone coal. In the course of a few days he was astonished at seeing the roses assume a beautiful red hue, as brilliant and lively as he could desire.

He tried the experiment upon a pot of petunias, and soon after all the pale and indefinite colored ones became of a bright red or blue, and the white petunias were variegated with beautiful red stripes. Some of the lilac petunias became a fine dark blue. Other flowers experienced similar alterations; those of a yellow color alone remained insensible to the influence of the coal.

COTTON manufacturers in the south are on the increase; 150,000 spindles are now in active operation. Most of the mills are in Georgia. Those now in operation are said to pay from 10 to 20 per cent. on capitals ranging from $100,000 to $1,250,000.

SCIENTIFIC PROGRESS.

New Sensitive Singing Flame.

Philip Barry described in *Nature*, of last November, a very sensitive flame, produced by placing a piece of ordinary wire gauze on the ring of a retort stand, about 4 inches above a Sugg's steatite pin-hole burner, and lighting the gas above the gauze. At the least noise the flame roars, sinking down to the surface of the gauze, becoming at the same time almost invisible. It is very active in its responses, and being rather a noisy flame, its sympathy is apparent to the ear as well as the eye. W. E. Stevens writes to the *Am. Jour Sci.* that a simple addition to this apparatus gives a flame which, by slight regulation, may be made either (1) a sensitive flame merely, that is, one depressed and rendered non-luminous by external noises, but which does not sing; (2) a continuous singing flame, not disturbed by outward noises; (3) a sensitive flame, which only sounds while disturbed; or (4) a flame which sings except when disturbed. The last two effects are novel. To produce the flame it is necessary merely to cover Barry's flame with a moderately large tube, resting it lightly on the gauze. If the gauze and tube be raised, the flame gradually shortens and appears less luminous, until at last it becomes violently agitated and (2) is produced. The sensitive musical flame (3) is produced by lowering the gauze until the singing just ceases. It is in this position that the flame is most remarkable. At the slightest sharp sound it instantly sings, continuing to do so as long as the disturbing cause exists, but stopping at once with it. So quick are the responses that by rapping the time of a tune, or whistling or playing it, if the tones are high enough, the flame sounds faithfully at every note. By slightly raising or lowering the jet the flame may be made to sing at a hiss, the rattling of keys, folding paper, or even moving the hand over the table. On pronouncing the word "sensitive" it sings twice; and in general, interrupts the speaker at almost every "s" or other hissing sound. All the experiments can be made under the ordinary pressure of street gas, three-fourths of an inch of water being sufficient.

Varieties of Matter.—We extract the following from an article by Prof. Morton in the May number of the *Am. Jour. Sci.*: Matter exists certainly under two and probably under three varieties: *ordinary* or *gross matter*, directly recognized by our senses; *universal* or *luminiferous ether*, filling all space and pervading the insterstitial spaces of all bodies of ordinary matter, the existence of which is inferred from optical phenomena; and *electric ether*, associated with all bodies of ordinary matter, whose existence is inferred from electrical phenomena. Possibly these varieties may not differ in their essential nature. It is at least conceivable that the atoms, so called, of ordinary matter and of electric ether are condensed groups of atoms of the universal ether; and hence that there is essentially but one form of matter in existence. It may be that the electric ether, the supposed agent of electrical phenomena, may be shown ultimately to be identical with the luminiferous ether; but in the present state of physical science they cannot be so regarded. It is supposed by some physicists that electrical phenomena may consist in some mode or modes of motion of the atoms of ordinary matter, and that the forces of electric attraction and repulsion may originate in such motions. But this notion cannot be regarded as anything more than a conjecture. The existence of an electric ether has not been as conclusively established as that of the luminiferous, but all the phenomena give decided intimations of the operation of such an agent, and thus serve to confer upon the hypothesis of an electric ether a high probability.

An Educational Experiment.—A novel and interesting experiment in the field of elementary instruction has just been resolved upon in Saxony. Hitherto, as everywhere else, so in that small but highly developed kingdom, the youth of the lower order, upon being apprenticed to a trade, have been left at liberty to forget what they learned at school. Attendance at Sunday schools and evening instructions provided by the State, and charitable societies, were perfectly optional. By law this liberty is abridged, and compulsory attendance at evening schools exacted for a period of three years. This is, we believe, the first time in the annals of the world that an attempt has been made by a State to extend the education of the humbler classes beyond the merest rudiments, and after they have entered upon the business of life.—*Ex.*

Narcotic Action of Tobacco.—Vohl and Eulenburg have investigated the narcotic action of tobacco, especially examining the action of tobacco smoke. As the result of their analysis, they are led to the opinion that the disagreeable symptoms of the incipient smoker and the chronic affectations produced by excessive smoking, as well as the poisonous effects of tobacco juice when swallowed, are due to the pyridine and picoline bases, and not to the nicotine. They explain the fact that stronger tobacco can be smoked in cigars than in a pipe, by finding that more of the volatile bases are present in pipe smoke, more especially of the very volatile and stupefying pyridine; while in a cigar little pyridine and much collidine are formed.

Aniline Colors Poisonous.—According to Drs. Pohl and Eulenberg, of Cologne, aniline colors are poisonous. Aniline itself is an acknowledged poison, and all coloring matters containing unchanged aniline are therefore capable of poisonous effects. In the preparation of the colors the strongest oxidizing agents are used, and of these many are violent poisons, as arsenic acid, chlorides of zinc and tin, antimony and lead compounds. If any of these substances remain in the manufactured coloring matter, of course the article is dangerous; not of itself, for this is innocuous, but from the metal poisons it contains, and from the acids combined with them, as hydrochloric, acetic, arsenious and picrine acids. Moreover, many coloring substances are manufactured from the residues of aniline factories, and these contain the largest amounts of poisonous matters. These last, on account of their less cost, are extensively used, principally for red carpets, toys, common articles of confectionary, bonbons, drops, etc.; also for toys made from transparent rubber, and for nursing bottles. Cases of poisoning from woolen and mixed goods, dyed with aniline colors are known. The same is true of pheuil colors, and the subject demands stongly the adoption of sanitary regulations.

Effect of Colored Light on Vegetation.—The opinion of Poey's that violet light has a most favorable effect upon the growth of animals and plants led a Mr. Bert to make experiments (not yet quite concluded) on a large scale. He placed 25 plants of different families, which differ greatly in respect to need of light, in compost beds, covering these, first, with common glass; second, with dull white glass; third, with blackened glass; fourth, with red; fifth, with yellow; sixth, with green, and seventh, with blue glass. The red, green and blue were, examined in the spectroscope, almost monochromatic; but the yellow glass transmitted all other colors, only more weakly. Experiments carried on from June to the end of August gave the following results: In general the green light is as bad for plants as is darkness; red is less injurious, though decidedly hurtful; then comes yellow; least injurious is blue. But all colors are unfavorable for plants, except when combined in the proportions contained in white.

Auroral Displays in the U. S.—The *American Journal of Science* gives a table of the auroral displays in the United States, in the year 1871. The total number of days is 170, divided as follows:

Jan.	11 Days	July	9 Days
Feb.	13 "	Aug.	12 "
March	15 "	Sep't.	13 "
April	16 "	Oc't.	15 "
May	17 "	Nov.	19 "
June	17 "	Dec.	12 "

During the past three years the number was as follows:

1869	192 Days
1870	233 "
1871	170 "

The correspondence of these results with the number of spots visible on the sun's surface is quite noticeable. The disturbance of the sun's surface attained its maximum in 1870, and is now rapidly declining. It is anticipated that the number of auroras visible in the United States in subsequent years will exhibit a similar decline.

The Parchment Fluid of the chemist C. de Sonvageon is said to have the property of preserving paper from the injurious effects of moisture. Drawings which can be injured by rubbing are moistened with the fluid on the back side at first (the fluid is applied by means of a sponge), or if this is not possible a paper is laid over them and the fluid applied to this. After the first coat has dried on, which requires about twenty minutes, the fluid can then be applied without further precaution. If the drawings are not liable to rub out, the fluid can be put on directly in the beginning. Paper thus treated has, besides its unsusceptibility to injury from moisture, the following valuable properties: 1. Spots of all kinds can be removed by washing with soap-water; 2. Drawings in lead or chalk can be permanently fixed; 3. Paper treated with two or three coats of the preparation can be written on with lead or ink, and the writing can no washed off.

The Lowest temperature at which seeds can sprout has been generally taken to be 4° or 5° Reaumer (41° to 43° Fah.). Decandolle found that all the seeds with which he experimented, sprouted at a temperature of 4° or more; only the *lepidium sativum* (garden cress) and *linum usitatissimum* sprouted at 3°, and 5 out of 30 seeds of the *sinapis alba* (white mustard) at 0°. Uloth, according to the *Flora*, on clearing out an ice-cellar, found in pieces of ice fully sprouted seeds of maple and wheat, which flourished when transplanted to soil. The cellar was fully dark and the temperature zero (32° Fah.) at the spot where the seeds were found.

The Thermometer at High Altitudes.—The higher we ascend, the colder it becomes; and yet at very great elevations the rays of the sun exert a heating power greater than that which they are found to produce in the valleys. Prof. Piazzi Smith found, that on the top of Teneriffe, at an elevation 10,000 feet above the level of the sea, a thermometer exposed to the direct rays of the sun showed a temperature of nearly 200° Fah.!

MECHANICAL PROGRESS.

More About Lubricators.

The best efforts of both mechanics and chemists have been directed to the preparation of a perfect lubricator, and although much remains to be accomplished, yet the results already attained are exceedingly satisfactory. For light machinery the requirements are that the lubricating material shall be a good anti-friction agent, not easily deteriorated by the combined action of friction and air; and for some purposes, at least, such as sewing machines, that it shall be cleanly. These conditions are most perfectly fulfilled by well purified oils, such as sperm or olive. The gummy and gelatinous matter, as well as all moisture, must be thoroughly removed, and oil in this condition is readily found in market, being prepared for the use of gunsmiths, clockmakers, sewing machine workers, etc. Lubricating material for heavier machines is still more easily found of tolerable quality, and it is only when we come to really heavy work that we again find it difficult to obtain a really suitable article.

All surfaces which are pressed together with great force should be lubricated with a comparatively hard material; otherwise the lubricator will be expelled from between them, and the friction will soon become greater than at first. Hence, instead of liquid oils, the heavy semi-fluid petroleums have been used with great success; and where matter of animal or vegetable origin is employed, the solid fats, such as lard, tallow, palm oil, etc., are preferred to the true oils. Nor does the intelligent mechanic stop here. In order still further to harden the oil or grease, be employs alkali, and by the use of caustic soda he converts it into a mild species of soap. But where the work is heavy, and especially where the surfaces are soft, the best lubricating material is plumbago. We have seen it tried on wooden surfaces, such as wood screws, which will perform at least twice as much work after being carefully rubbed with a mixture of soap or tallow and plumbago.

In the case of wooden bearings nothing that we have ever seen tried, lessens the friction as well as plumbago. The same is true in regard to cast-iron surfaces such as the ways of heavy planers. These often cut in such a manner as to become almost unmanageable, in which case a little really good plumbago remedies the evil at once. Poor plumbago, on the other hand, only aggravates the evil. The use of plumbago for this purpose has long been known, but until quite recently, no effort seems to have been made to call general attention to it.

Metalline.

The famous anti-attrition used in Europe consisted simply of plumbago and lard, and at different times attempts have been made to create an excitement by the announcement of a new lubricator under some high sounding names, such as metalline, mineralline, etc.; the entire virtue of such materials, where they possessed any virtue at all, being due to plumbago. A striking example of this was given a few months ago, when almost every industrial journal in this country and Europe rang with the praises of metalline; although to judge by the final result, these laudations were based upon a very slender foundation of fact.

But although we have particularly recommended the use of plumbago for heavy machinery, it must not be supposed that it is unfit for lighter work. Sixty years ago, M. Lewis Herbert, of Chelsea, Eng., used it in a very refined state as a substitute for oil, in diminishing the friction of the rubbing parts of the clock. He applied it to a siderial time-piece, in January, 1816, between which period and 1827 the time-piece was cleaned three times without renovating the plumbago; the friction places being only wiped with a fine muslin rag. In a communication to the Society of Arts, in 1827, eleven years after the plumbago had been applied only once, he states that the time-piece was going as well as ever. He found great difficulty in applying it to the jewelled pallets of the escapement, but got over this by applying it to the friction plane of the teeth of the swing-wheel; and he adds, "so, ever since the clock has gone without oil."

We feel assured that the principal reason which has hitherto kept plumbago from being generally used as a lubricator has been the difficulty of obtaining a good article. Until within a comparatively recent period, no effort has been made to place before the public an article prepared with special reference to lubricating purposes; but we are happy to observe that a movement has been made in this direction, and really suitable specimens can now be readily obtained.—*Handicraft.*

Ventilation and Heating.—It is said that an apparatus has now been perfected which may be applied to cooling the air of theatres, halls, and all public or private dwellings. One of these machines will either produce 200 pounds of ice per hour, or will furnish in the same time 33,000 cubic feet of air, cooled to a temperature of 33 degrees Fahrenheit. It is probable that in a few years we will turn on from the same registers the cool air in summer and the hot air in winter. The application of such an apparatus to the pipes of a heater would be extremely simple, and furnish just what we want when the heater is off duty.

Keenan's Boiler Coating.—Much value is assigned to a substance known as Keenan's Boiler Coating, as a means of preventing the radiation of heat from steam-boilers, and the saving, in consequence, of fuel as well as of time in bringing steam up to the proper degree of tension. The substance is a pulp composed of paper, oil, and certain chemicals, and is laid cold on boilers, steam chests, steam-pipes, or any other article that is to be protected from the outer atmosphere to the thickness of an inch and a quarter; on superheaters two inches are required. The boiler, however, must be kept warm during the coating process. When the pulp has properly set it receives three coats of paint, and can, if necessary, be grained and made to look ornamental.

The editor of the London *Mechanics Magazine* has recently examined certain boilers coated with this substance, and found that with boilers in actual operation the exterior exhibited a gentle warmth just perceptible to the touch. He also was informed that it was the practice of the stokers to draw their fires at half-past three in the afternoon and to close the dampers, the steam being then at about thirty-five. On resuming work in the morning at five o'clock, A. M., the gauges generally showed twenty-five pounds of steam, or a loss of only ten pounds during the night as the result of radiation.

Wall Paper Impressions.—About one year ago, some fertile-minded genius hit upon the idea that the most perfect imitations of different kinds of wood for wall paper would be impressions taken from the wood itself. With this notion in his head he went to work, and the result is, an exact copy of the surface of the plank in use. Thus a walnut plank is planed off and from its surface is printed thousands of sheets of wall paper. The same process produces *fac similes* of oak, mahogany, maple, and in fact, all kinds of timber. We yesterday examined specimens of this beautiful work at the paper house of Miller & Badger, in this city, and confess our astonishment at its completeness. The copies are like printed sheets from engraved plates. When hung and varnished this class of paper presents a rich and beautiful appearance.

Steam on City Railroads.—On city cars the great and positive objection to steam has hitherto been the noise of the exhaust steam. This noise is entirely suppressed by an appliance adopted by L. J. Todd, Leith, England. He uses a fan blast and drives the fan with a turbine, by changing the blast nozzle from the funnel, so as to cause it to discharge the exhaust steam against the turbine. The waste steam from the fan is led into the funnel by an opening, the area of which is so large as to positively prevent the noise usually occasioned by exhaust. It will be seen that this is also an excellent method of applying blast, as it is increased or diminished just in proportion to the rate of speed, and ceases when it is not wanted. An auxiliary pipe from the boiler direct can be used to drive the turbine if desirable when the engine is standing still.

Why Railroad Bridges Break.—A correspondent of the *Business Guide* submits the following theory: It is the custom to allow trains to approach the bridge at full speed, slacking up only when immediately before and while on the bridge. The brakes are thus applied to the wheels while on the bridge; the rails on which the wheels are running must therefore resist the momentum, and as they are fastened directly to the bridge, a tremendous longitudinal strain is brought to bear upon it. Especially is this the case when the locomotive has passed over and the train, with brakes down, is still on the bridge. To illustrate this philosophy, take a small wagon and place it on a light table, lock the wheels and attempt to draw it across the table. It will be readily seen that the table is drawn over in the same direction.

Burnt Cast Steel that has been spoiled by overheating can be partially restored, it is said, by heating it over and quenching in water four or five times, each of less extent than the first overheating and decreasing; lastly, hammering the steel till nearly cold, to give the greatest condensation before hardening. Some prefer the steel thus recovered for cutting tools, and the treatment really produces a remarkable change, as a fragment of the same bar in the spoiled state will be extremely coarse, and another of the restoration as extremely fine.—*U. S. R. R. and M. Register.*

A cement of great adhesive power may be made by rubbing together, in a mortar, two parts of nitrate of lime, twenty-five of water and twenty of powdered gum arabic, this forming a transparent cement of wonderful strength and applicable to wood, porcelain, glass and stone. The surfaces to be united should be painted with the cement and firmly bound together until the drying is complete.

The Value of Pig Iron manufactured in the United States last year was $75,000,000. The product of the rolling mills and forges was $63,000,000, the value of other manufactures was $762,000,000, and the entire value of manufactured iron for the year was $9,000,000.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

MILLS.—Monitor *Miner*, May 18: The two quartz mills will start up soon.

GLOBE.—The steam hoisting works are to he started up and a full force put on shortly.

ORE.—200 lbs. of ore from the M. &. N. W. mine assaying over $80 per ton was shipped to New York this week.

AMADOR COUNTY.

GOVER.—Jackson *Ledger*, May 25: The main shaft 7 hy 4½, is down 80 ft., with well defined ledge, foot and hanging walls. Tho Co. have erected hoisting works of a substantial character. The rock from the main shaft looks remarkably well. South of the main shaft 250 ft., another shaft has been started and is down 25 ft. The rock in the last mentioned shaft is very rich, showing free gold and rich sulphurets.

GOOD HOPE.—Preparations are being made for starting up this mine again.

MAHOGANY.—This mine, near Sutter, is producing very rich rock.

PHOENIX.—Jackson *Dispatch*, May 25: Preparations were commenced this week to erect a 40-stamp mill on the mine.

CALAVERAS COUNTY.

GWIN MINE.—San Andreas *Citizen*, May 25: This mine is soon to get under full headway again. Mr. Gleason is working the lower mill and mine, and has struck rock of extraordinary richness in the 300 ft. level.

FRESNO COUNTY.

STAYTON MINE.—Gilroy *Advocate*, May 25th: Five pounds of cinnahar, assayed gave 2 lhs. 4 oz. pure quicksilver.

INYO COUNTY.

WAUCOBA DIST.—Inyo *Independent*, May 18th; Mr. Brady has a force of 10 to 15 men employed in mining, putting up a rook breaker and making preparations for building a furnace.

CERRO GORDO.—An extensive strike of lead is announced in the Union mine.

NEVADA COUNTY.

SHAMROCK.—G. V. *Union*, May 21: In the Shamrock the miners are down on the ledge for 50 ft. The ledge at that depth is 6 inches thick and shows well in sulphurets, galena and some free gold.

TOWN TALK.—Yesterday we saw at Findley's bank gold dust worth at least $3,000, the result of 4 weeks run. The expense of the run was under $1,400.

NAPA COUNTY.

OVERLAND.—Napa *Reporter*, May 25: This Co., near Oakville, have struck a fine deposit of cinnabar.

BLAST.—2,800 lhs of giant powder was discharged in a tunnel 60 ft in length yesterday at Dutch Flat. It shook up some 20 acres of surface.

PLUMAS COUNTY.

FLUMING ENTERPRISE.—Quincy *National*, May 18th: Mr. McVay, of Meadow Valley, has made locations, and been busy securing titles, &c., with a view of constructing a flume through the valley, to carry off the immense deposits of tailings in Spanish Creek, and also a branch flume to work the Elizabethtown flat.

SAN DIEGO COUNTY.

ITEMS—BANNER DISTRICT.—San Diego *Union*, May 16th: Two-fifths of the Antelope mill and mine, were sold to Chester Gunn for $5,000 on the 7th inst. One-fifth of the same property was sold on the same day to J. E. Duprez for $2,500.

STONEWALL.—The new steam pump has a capacity of 7,000 gallons per hour. The engine recently purchased—40 horse power—has been placed in position, and the mill has been entirely re-set. In about 30 days they will add to the 5 stamps they use at present, an additional 5.

San Diego *Bulletin*, May 18th: THOMPSON & BICK, the discoverers of the ledge some 14 miles west of Julian, are running a tunnel in the hill, about 130 ft from where they discovered the ledge, intending to strike it 50 ft below the surface. They have tunneled 120 ft, and expect to find the ledge within 25 ft further. The croppings are rich.

SISKIYOU COUNTY.

RESUMED.—Yreka *Union*, May 18th: Work has been resumed on the Siskiyou Quartz ledge on the Middle Fork of Humbug.

TUOLUMNE COUNTY.

GOLDEN GATE LODE.—Sonora *Independent*, May 25th: This lode continues to prospect well, and several extensions have been located to the extent of nearly 2 miles; all of which prospect as well as the original. It is 4 ft 10 ½ inches wide.

CHISPA.—A fine nugget of pure gold, weighing about $20, was found, one day last week, on the Columbia and Jamestown road.

Nevada.

ELKO COUNTY.

RAILROAD DISTRICT.—Elko *Independent*, May 25th: The State of Maine tunnel on Gold Hill, has struck a large body of pay ore at the back end of the tunnel within 20 or 25 ft of a 90 ft shaft. The Last Chance on Bunker Hill, has an inclue shaft 90 ft decp, which has opened out an immense body of rich ore, from which has been extracted some 400 tons of first class ore. The Hussey tuunel has struck a fine ledge of first class ore, and has upon the dump 100 tons of ore.

EUREKA DISTRICT.

THE CONS.—Eureka *Sentinel*, May 18th: Two additional furnaces to he erected immediately.

WORK TO BE RESUMED.—Work is to be resumed this week on some mines belonging to Alec. O'Neil and others, in the Diamond range.

ORANGE MINE.—Is near the summit of Prospect Mountain. An incline is down several hundred feet and rich ore is being extracted. Recently a large body of high grade ore was found in the upper level.

RICHMOND CO.—This Co. will start up their large furnaces of 74 tons capacity on Monday next.

ELY DISTRICT.

LOCAL REVIEW—Ely *Record*, May 19: BULLION.—This week W. F. & Co. shipped $90,131,98.

AMAZON.—The main shaft is down 65 ft. showing ore throughout, assays from which run from $60 to $300 per ton.

SPRING M. TUNNEL.—Have commenced work on the ledge struck in the winze sunk from the chamber opened up where the first ledge was cut. The ore shows well in the face of the drift.

CONDOR.—Old shaft down 110 feet and still sinking on contract.

VANDERBILT.—The shaft is down 125 ft. The rock in the bottom is changing for the better, quartz coming in, and prospects excellent. At a depth of 150 ft. a drift will be run.

CHAPMAN.—The main shaft is down about 300 ft., and still sinking. The mine is well opened, and has about 350 ft. of drifts run on the ledge.

PAGE & PANACA.—Shaft down 230 ft., and sinking rapidly.

CHIEF OF THE HILL.—The ledge in the west winze continues to widen, and shows mineral 4 ft. in width.

GRAY EAGLE.—The shaft is down 25 ft. and shows ledge matter 3 ft. in width, with ore throughout.

HIGHLAND DIST.—OTHELLO M.—Working in tunnel on west end, and shaft on east. Assays run from $50 to $500 per ton.

EXCELSIOR.—Connections for air have been made. On Friday night last cut into a solid vein of ore on the lower level, 115 ft. from the surface.

SAN JOSE CONS.—Main shaft down 90 ft. and shaft from the bottom of this, following the ledge, down the same distance, showing mineral throughout.

ARKANSAS.—Sinking the shaft with 3 shifts, and down about 110 ft. Between 35 and 40 tons of good ore on the dump.

SPRING MOUND.—Commenced timbering the shaft on Saturday last.

STIRLING.—Shaft down 98 ft.; ledge in bottom 5 ft. wide, ore looks well and assays over $100 to the ton.

HUMBOLDT.

BULLION.—Unionville *Silver State*, May 25: Amount shipped from the Arizona, since our last issue, was $7,770.

REESE RIVER.

OREGON.—Reese River *Reveille*, May 18: Never looked better; large quantities of magnificent ore coming out.

SAYBROOK.—Taking out ore from the 110 and 150 ft. levels; ledge 12 inches wide; ore fair, fifteen tons on hand; work-10 men.

NORTH STAR SHAFT.—Wyman & Co., have about 30 tons of high grade ore on haud; ledge looking well. O'Neil & Co., have about 20 tons of good ore out and are getting more, mine looks fine.

GROVE TUNNEL.—Working 10 men, Rich ore is coming from the 225-ft. level; ledge 10 to 12 inches wide.

SOUTH SONOMA.—Sinking incline in the east level in good sulphuret ore; driving ahead in upper level but getting no ore; 5 men at work.

LANE & FULLER—PACIFIO CO.—Working 50 men at 4 levels; getting ore from all the levels; since our last report the Co. have had 60 tons worked, of which the first-class went $930 per ton, the 2d-class $310, and the 3-class $150; 50 tons ready for the mill.

SARATOGA.—Ledge 6 to 18 inches wide; working 10 men; about 20 tons in the house.

WEST TROY INOLINE.—Pay has just been struck; incline 300 ft. deep; hoisting by means of a whim; working 4 men.

DIANA.—Getting first-class ore.

MORGAN AND MUNCEY.—Good ore coming out; ledge holds out well.

PRUYN AND PULLEN.—Getting very fair ore; looking better than at last report; working 6 men; incline down 200 ft.

DOLLARHIDE INCLINE.—Working 6 men; running cross-cut to strike the ledge at 300 ft.

SEMANTHE.—Working 2 men at 160 ft. level; six inch ledge; looking very good; abont 5 tons of ore on the dump.

IOWA TUNNEL.—Hatfield, Braggs & Co. are running the tunnel ahead to cut the Huhbard ledge; have cut 3 ledges in running the tunnel 200 ft.

WHILATCH UNION.—Three Cos. at work. Reed & Co. are running hoisting works and working 4 men at the 218 ft. level; getting an average of $200 per ton.

SAM BRANNAN.—Incline down 150 ft.; at the last crushing the first-class ore went $600 per ton, second-class $135, third-class $75.

VIRGINIA SHAFT.—Ledge 6 to 10 inches wide; ore fair at 100 ft., workiug 4 men.

PATRIOT.—Incline down 200 ft., at which point the ledge is 18 inches thick and the ore very rich; working 4 men.

OAKLEY AND JAMISON.—Tunnel in 75 ft.; in exceedingly rich ore, with a good sized ledge.

MANHATTAN.—This mill is steadily at work night and day.

CITIZEN'S MILL.—In *statu quo*.

WREN'S CONCENTRATOR.—These works are shut down for a thorough overhauling.

BELMONT—EL DORADO SOUTH.—Double shafts have been put on every breast. The 340 ft. levels are going ahead 2 ft. per day. The sinking of the main incline is being pushed ahead. On Thursday last very rich black metal ore was struck at the extreme bottom, 375 feet from the surface, and the indications are that an immense body of this ore is at hand. Working 31 men.

LIDA VALLEY AND COLUMBUS.—The "Lida Belle" at 10 ft. shows about 16 inches of high grade ore. A contract has been let to continue the shaft to 20 ft. At Columbus, the 5-stamp mill of Sweetwater, Hazelton & Co. is running steadily on ore from the Cos. mines and custom ore.

WASHOE.

BELCHER.—Gold Hill *News*, May 25: Daily yield 300 tons, from the 1,100-ft. level principally. The Belcher folks have got their new hoisting machinery nearly all in place at their shaft, and the works will he ready to start up about the first of next month. The incline is down to the 1,000-ft. level, and drifting both ways from it and toward it is being energetically prosecuted. There is about 400 ft. of intervening ground to drift through between the incline and the workings at that level before the connection will be effected. The 1,200-ft. level is opening out finely and looking better than ever.

HALE & NORCROSS.—Daily yield 130 tons principally from the north portion of the 1400-ft level. The ore breasts of the 1400-foot level are being extended northward and upward in the vein, the highest raise above the sill floor being nearly 50 ft, showing the ore to be of inferior character to that below, not averaging so well. The north drift has reached the Savage line and will counect with the drift being run from that mine for ventilation. At the 1500-ft level the east drift is in 115 ft from the incline. The north drift is in 93 ft from the incline, and is altogether in the west country rock—west of the ledge.

SAVAGE.—Daily yield, 190 tons, averaging as per assay $27. At the 1500-ft level the drift south is being pushed ahead to connect with the drift from the Hale & Norcross for air. The cross-cut from this drift is being vigorously driven ahead. Breasting out ore body in the winze is commenced, and it is opening out finely. Work on the north drift at the 1500-ft level is suspended for want of proper ventilation at present.

CROWN POINT.—There was quite a decrease of the usual ore production this week, owing to trouble with water tapped at the 1300-ft level.

YELLOW JACKET.—Daily yield about 25 tons of fair grade ore from the old workings.

JUSTICE.—The water is at last reduced in the shaft down nearly to the track floor of the drift at the 400-ft level. The Co. are taking out some very good paying ore from their portion of the old Waller's Defeat ground.

OVERMAN.—The pumps are put in, and sinking the main shaft deeper will be resumed at once. The west drift of the 1000-foot level is in good working ground with promising indications.

CHOLLAR-POTOSI.—Daily yield 160 tons, from the old workings. The main shaft and incline of the Co. is being cleaned out to deeper sinking and prospecting.

IMPERIAL-EMPIRE.—The two drifts toward the Imperial and Empire mines respectively, at the 1650-ft level have neither reached the ledge as yet, but will shortly.

OPHIR.—The main drift at the 1100-ft level is in 400 ft, and cross cutting east from the end of it was commenced Tuesday.

BUCKEYE.—A new and very promising development of $60 ore is made in the south drift at the 100-ft level.

DANEY.—Shaft 45 ft below the 500-foot level and still sinking, although with considerable water to contend with. Drifting north at the 500-ft level is going on energetically.

MCMEANS.—The new tunnel has tapped the back ledge, and good milling ore is being taken out.

JULIAN.—The 800-ft station has been reached by the shaft, which progresses deeper at the rate of 3 ft a day.

GOLD HILL TUNNEL.—The new shaft of the 1000-ft station of the tunnel, is fairly commenced and being sunk rapidly.

GOULD & CURRY.—The incline is being sunk a the rate of 3 ft a day. The east drift from the tenth station is also progressing satisfactorily.

SUCCOR.—New shaft is down 80 ft, and work progressing well.

SILVER HILL.—Shaft enlarged and thoroughly retimbered 110 ft.

BALTIMORE.—New engine and other machinery being put in place and sinking the main shaft rapidly.

SUTRO TUNNEL.—Entire length 2,893 ft.

WHITE PINE.

TREASURE HILL MINES—EBERHARDT.—White Pine *News*, May 18: Breasting out and running ore through the tunnel to No. 15 loading station. The grade is of a fair milling quality.

WARD BEECHER.—Connection is made with the Phillpotts chamber to the drift leading to the Engine shaft. A force of men is at work in the North end of the mine, on good ore.

NORTH AURORA.—There has never been discovered in White Pine Dist. a richer and more extensive body of ore than is in sight in the Lady's chamber and other openings of this mine. From present appearance, we should judge that the ore supply from this one mine alone would keep the mills of the Co. running for at least a year, with a probability of a continuation of the ore for a much longer time. There is about 100 tons of ore extracted daily from the North Aurora and Ward Beecher.

NOONDAY.—The grade of the ore has increased since last reported on.

BEECHER CONS. M. & M. CO.—The mines of the corporation, consisting of 300 ft. of the Ward Beecher Cons. and 325 ft. of South Ex. Hidden Treasure, are showing well. In the Anchor tunnel incline, the ore extracted will mill $35 to $50 to the ton.

EAST SHEBOYGAN.—Work is prosecuted vigorously and there is a marked improvement in the appearance of the ore body since our last Review.

COPPER GLANCE.—Work in the north drift is going ahead with favorable indications of soon coming into a body of good ore.

SECOND SOUTH EX. HIDDEN TREASURE.—Work progresses in the north shaft with good indications.

OUTSIDE DISTS.—Bald M. dist. is 60 miles South of Elko, in the Ruby range of mountains. There are copper and silver ledges showing well-defined walls. There are parties negotiating for the purchase of several of the copper and silver mines.

ROBISON DIST.—The Canton will start up the furnace, recently purchased, as soon as coal is at hand. The mines owned by the Co., are looking well. There is a large amount of ore on the dumps, ready to be shipped to the furnace. There are at least 100 mines discovered.

Arizona.

YAVAPAI CO.—MINES AND MINING.—Prescott *Miner*, May 11: Shaft is down about 20 ft., at which depth there is an immense body of ore, much of which, yields 50 per cent. silver. The rock also carries considerable gold.

J. Cusenbary has gone to work on his

silvor mine, near Castle Creek, pieces of ore from which have assayed as high as $25,000 to the ton. There is on the mine a shaft 45 ft. in depth.

Colorado.

SHIPMENTS. — Georgetown *Miner*, May 9: Since last report, G. W. Hall & Co, have crushed, sampled, packed and shipped 80,116 lbs. of ore.

Baily & Nott have forwarded 100,955 lbs of ore.

The amount of oro crusbed, sampled and sacked at the mill of tbe Snowdrift Limited, during the past month, was 91,890 lbs. This ore assayed from 70 to 1,000 ozs. per ton of 2,000 lbs.

Palmer & Nicbols have shipped bullion bars as follows: Apr. 6th, bar, 65t·90 ozs.; 736 fine; $623.20, coin value. Apr. 11, 504·95 ozs.; 839 fine; $547.77, coin value. Apr. 24, 1,235·95 ozs.; 831 fine; 1,327 90, coin value. Apr. 30, bar, 421 ozs.; 799 fine; $434 94, coin value. May 6, bar, 755·30 ozs.; 560 fine; $546 84, coin value.

ITEMS.—Hood & Co. have commenced mining on a large scale on Clear Creek and Columbian Mt. They are working three lodes, tbe Goshen, Burnett, and Martha. Theso lodes show from 4 inches to 1 ft. of ore, which carries from 200 to 500 ozs. of silver per ton.

A number of samples of ore from the newly discovered mines on tho head of the San Juan river, Conejos Co., have been assayed. The richest ore was from a lode known as the Little Giant, which yielded $31,267; 52 in gold, and $119 08 in silver per ton. A number of samples of silver ore from the vicinity of Loma, in Costilla Co., assayed from $42 to $76 per ton.

MINING NEWS.—The Argyle T. and M. Co. are running a tunnel into Red Eagle, on the north side of Clear Creek, about 5¼ miles below Georgetown.

The Jndd & Co. works are going forward finely.

Caribon *Post*, May 11: S. S. Moore & Co. are drifting on tho Silver Point and taking out a large quantity of valuable ore. The Boulder lode is about to be re-opened. Stewart's mill, Georgetown, will he ready in about a month to commence reducing ores again.

Central *Register*, May 8: Bates & Sou started their new mill, in Nevada Gulch, last Tuesdsy.

FISKE LODE.—Samo paper, 15th: Mining matters on tbe Fiske lode are quite active, and ore in considerable quantities is being taken out.

ST. LOUIS S. & R. Co.—Central *Herald*, May 15: Tho works of this Company are rapidly approaching completion.

The continusl new discoveries of rich and extensive silver deposits on Mts. Lincoln and Bross, in the South Park, is exciting much attention, and attracting hundreds of adventurous miners,

CARIBOU.—The Silver Point is said to be very wide, and assays give a yield of from $5,000 to $15,000.

NEVADA.—On the Ophir Co.'s property on tbe Kansas lode 26 men are employed.

Esst of tho Ophir property on the Kansas, Solomon Row & Co. have sunk a sbaft over 260 ft and bave struck fair psy.

Again esst of this George Estabrook is working men on the the University's claim, and is taking out weekly 8 cords of 6 oz. milling ore.

On the next property east Wollcott & Lewis have agsin commenced to sink the shaft on their claim and are working 4 men st stoping, who are tsking out about 6 cords of 5 oz. ore.

Root & Co. are working claim east of Wolcott & Lewis, and removing from the mine large quantities of 5 oz. milling ore.

Idaho.

LOCAL RECORD—IDA ELLMORE.—Owyhee *Avalanche*, May 18: From the appearance of the ore taken from tbe winze, which is down 80 ft. below the 7th level, we aro compelled to helievo, that tbe Ellmore will turn ont vastly more bullion during the coming summer, than was ever taken out in one year before. In the winze referred to, the ore is immensely rich both in gold and silver; with a ledge avcraging from 2 to 3 ft. in width. The shaft is down 40 ft. for the 8th level, sinking hard. The ore house is full to overflowing.

MINNESSOTA.—This mine is being worked with ahont 32 men, taking out daily from 12 to 15 tons of ore. The north drift is in 40, and the south 20 ft. They are slso sinking a winze from 2d to 3d level, which is down about 40 ft. sbowing a good vein of ore.

MAHOGANY.—Taking out 15 to 20 tons per day. The 5th level is showing splendidly. The winze hetween the 4th and 5th levels has exposed a rich vein all the way as far as sunk and raised. The 5th level drift has opened the vein over 100 ft., and the foremsn informs us that he will soon commence sinking both shaft and winze for the 6th level. Two bars of Mahogany hullion were shipped to S. F. on the 28ult., valned st $10,414,30.

SOUTH CHARIOT.—The main or engine shaft is being repaired rapidly.

EMPIRE.—The winze is down nearly 60 ft., and the shaft 35 ft., both being worked with men on 8-hour shifts.

WAR EAGLE.—There is a large amount of ore on the dump.

GOLDEN CHARIOT.—Superintendent Phelby has ceased sinking in the winze and is enlsrging it to make a part of the shaft. The shaft is heing straightened and set back on the ledge, and will be 4x12 ft. in the clear, witb 3 compartments.

SANDS & Co. continue tsking splendid looking ore from the Illinois Central.

THE BLUE JACKET is ahout heing started up.

HAYS & HUMPHREY have started up their arastra, and will keep it running all summer. Trusk's arastra is also running.

Oregon.

SILVER. — Jacksonvillo *Times*: T. Murray showed us a fine specimen of silver ore, taken out of a ledge recently discovered on tho west side of Goose Lake. The ledge is 4 ft. in width and well defined, and tbe assay at 16 ft. gives $65 per ton.

Utah.

S. L. *Tribune*, May 21st: BASE BULLION.—Durant & Cutting shipped last week several car loads of hullion mainly from Flagstaff and Winnemuc mines. The Winnemuc is turning out $1,000 worth of bullion daily.

TINTIC.—A fine body of ore has been struck in the Copperopolis, assaying from $50 to $130 in silver and carrying some 5 ounces of gold to the ton.

THE SIERRA MINE.—In American Fork, has resumed operations for the coming summer. Tho owners are in drifting on the ledge, and from tho start have been taking out $100 orc.

LEWISTON.—There are but 2 Cos. that are extensively at work but several othors are making preparations to commence at an early day.

LITTLE COTTONWOOD.—Tbe Enterprise is down 65 ft, with a vein of good galena ore from 3 to 4 ft wide. Tbe vein is stripped 70 ft and shows this width the whole distance.

The Ghdiator tunnel is complete 400 feet, with indications of ore at hand.

The Great North-Western, is to be worked vigorously from this time forward.

The Christina near tbe Davenport, shows, at the 40 ft, a vein ore one foot in width that assays $200 to tbe ton.

BUTTERFIELD CANON.—Cor. same: "Cummings & Co. have about 30 men employed working on the "Lucky Boy," and have a large body of chloride ore in sight, which assays from $500 to $1,000 per ton. Tbe Gladstone have a tunnel in 120 ft. tbat will tap the ledge at 150 ft., also an incline shaft down 50 ft. with a 6 ft. body of splendid mineral giving an average assay of $200 per ton.

EAST TINTIC.—Cor. same: "The owners of the Ella are husily at work sinking their shaft. The vein is chiefly carbonate and galena. The Susan, second south extension, is down 90 ft.; it has a good vein of csrbonate and galena.

Cross cutting on tbe Bowers is being hurried along.

The St. Laurence is looking well as tbe shaft progresses. The Silver Bell near the Ocean mine is looking promising, it has an ore streak of ahont 4 ft. and assays woll. The 1st southern extension of the Showers mine, has 3 shafts down, one 36 ft. It has a vein of 4 ft., with an ore streak averaging 22 inches, composed of carbonate and galena.

MINING DISCOVERIKS.—A new gold mine has been discovered on tbe Santiam River about 40 miles from Lebanon, Oregon, and rich lead mines have been found in the Santism district, in the Cascado monntains. James Edelman recently sold a gold-hearing quartz ledge sitnated near Glover's Ferry, on the Snake river, Oregon, for $750, and then went off a few miles and found a hetter one.

A body of cinnabsr is reported to have been struck in a claim near Pacheco Pass about 30 miles from Gilroy. The specimens exhihited are rich and the owner states the quantity of ore to be large.

Gold is reported to have been found by L. Mesmer in gravel taken out of the excavation for a cellar on Fort Street, in Los Angeles. The *News* ssys that it is not improbable that there are rich deposits in the immediate neighborhood of the town.

MINING ACCIDENTS.—Wm. Hendry, a miner, working in the Gwin mine, Calaveras Co., was instantly killed last week, by heing struck in the head by the iron bucket, and knocked off the ladder while he was ascending the shaft.

John Williams of the Idaho mine was carried over the dumps with a car last week, and was hsdly hurt about the head and shoulders by the fall.

An Englishman, nsmed Davy, was killed in the Emma mine, U. T., on the 22nd inst., by a mass of rock and earth that fell on him.

THE CITY IRON WORKS.—Lewis & Morrill, proprietors, 28 Fremont street in this city has been recently remodelled throughout and much enlarged.

Attention is paid particularly to architectural and ornamental iron work, under the supervision of Mr. Oscar Lewis who has made this department of business a specialty for the past twelve years. A large amount of agricultural and foundry work is also turned out here, to which the attention of all interested is called. This establishment is now employing about 50 men.

STEAM PUMPS.—The use of steam pumps seems to be extending on this coast. Mr. W. D. Hooker has furnished among other orders, his California made steam pnmps for the following parties: Globe G. & S. M. Co., Alpine Co,; Phœnix mine, Amador Co.; Copper mine Copperopolis; S. F. Sugsr Refinery; City Gardens; Steamer H. Hutchingson; Steamer Crowquill; sixteen in Oakland for irrigsting and others purposes.

San Francisco Stock and Exchange Board.

THURSDAY, MAY 30th.

The sales at the Board for the week ending Wednosday 22d ult, amounted to $3,630,000. The sum of $13,000 was received from the Piocbe mino on the 24th inst. Tbe last weekly report of the Crown Point mine shows a production of 2,180 tons, vslued at $67,800. The Raymond & Ely sent down $31,000 on the 25th inst. The Hale & Norcross mino turned out 580 tons of ore last week, and has 2,400 tons on the dumps. Tho Savage yielded 1,380 tons, assaying $24.80 per ton. The Chollar Potosi mine produced last week 1,000 tons of oro, averaging $40.20 per ton. The number of shares in the Con. Virginia have been raised from 11,600 to 23,600. The receipts of the Piocbe mine for the year ending April 1st, were $232,232 including $182,000 from bullion, and $30,000 from assessments. The disbursements were $227,424. About 1,057 tons averaging $172 per ton were reduced. The following dividends have been paid this month: Belcher M. Co. $312,000; Black Diamond Coal Co. $25,000; Crown Point M. Co. $480,000; Meadow Valley M. Co. $60,000; Raymond & Ely M. Co. $210,000; Yule Gravel M. Co. $5,000.

Stocks have been rather quiet during the week, and buyers were scarcer than they have been for somo timo. On Friday, the 24th ult, the market was firmer than on the previous day, and all the Washoo descriptions exhibited an improvement. On Saturday stocks were comparatively active at irregular prices, and almost all kinds showed some advance over previous days sales. On Monday morning they fell again quite materially, and tbe afternoon session showed a still farther decline. On Tuesday there was a general break in the Board, and everything tumbled. From the prices of the previous day Alpha declined $14; Caledonia, $17; Chollar Potosi, $20; Crown Point, $20; Confidence, $10; Con. Virginia, $7; Exchequer, $11; Gould & Curry, $52; Hale & Norcross, $28; Kentuck, $40; Ophir, $7; O. H. Treasnre, $3; Overmsn, $10; Pioche, $2; Raymond & Ely, $8; Segregated Belcher, $20; Yellow Jacket, $31; Imperial fell $70 from Saturday. On Wednesdsy they recovered slightly from the severe depression of the day before and prices advanced a little. Tbe market this morning was much hetter, and the general advance of yesterday was sustsined.

MINING SALES.—The San Andreas *Citizen* says tbst Messrs. Ferguson and Wallace have sold their "Sheep Ranch" mine, to Messrs. Tullock, Gashwiler and Holladay for $60,000. The *Citizen* thinks that there is $100,000 in sight, and that the purchasers got a good hargin.

The Liberty quartz mine at Graniteville, has heen sold to a San Frsncisco company, and is shortly to be started up.

WATER SUPPLY.—A full supply of water for the mines would it is said sdd a million dollars a month to the present gold yield of California.

Norton's Door and Gate Spring.

"Please shut the door." How often we see this request posted on doors, and yet how little attention is paid to it. It seems as natural for an American to leave a door standing open behind him as it is for him to bolt down his food in a state of semi-mastication. Both of these habits result from the same cause, viz: the American custom of doing every thing with a rush. It takes too much time to wait and close a door, and often having to wait to open a door in order to get out of a room seems a waste of time. Why can't doore be made like the patent lazy farm gate, to open when it sees some one coming and close after the person has passed through? Norton's door and gate spring accomplishes the latter object, and thus one-half of the trouble is obviated.

This door and gate spring is a neat and cheap arrangement that can easily be applied to any door or gate for the purpose of keeping it closed, and we advise our friends who have posted on their doors the request at the head of this article, to pull it down and ap ly one of these springs It accomplishes the object in a very satisfactory manner. Davis & Bliven of this city are the proprietors of the patent right on this coast, to whom all ordere should be addressed.

Niles Station Bridge.

The Board of Supervisors of Alameda county have contracted with the Pacific Bridge Company, to erect a bridge of three spans, of 183½ feet each, over the Alameda Creek, near Niles Station. The superstructure is to he a Smith Truss. with roadway eighteen feet in the clear and built entirely of wood preserved by the Pacific Wood Preserving Company.

The piers are to he of cast iron, filled with concrete and sunk to hed rock, or a solid foundation.

They are constructed on the plan introduced hy the Pacific Bridge Company last year, and seem especially adapted to the rapid current and drift they will have to resist at the mouth of the Alameda Cañon, where they are to be placed.

The Pacific Bridge Company now dress all timber used in the framework of their bridges. They have just shipped a bridge to he erected over Hovias Creek, in San Mateo county, and will soon ship one of 150 feet in length, to span a creek in Sonoma county, hoth of the Smith Truss patent.

The bridge over Alameda Creek is to he completed hy the 11th day of August. The Howe Truss. Burr Truss and Pratt's Truss were all ompeting plans hut the Smith Truss was preferred.

Rapid and Practical Methon of Separating Copper from Silver.—In the preparation of nitrate of silver from silver coin which contains several per cent. of copper, R. Palm employs the following method, dependent on the insolubility of nitrate of silver in concentrated nitric acid:—

The coin is dissolved in nitric acid, and the solution evaporated to the consisteney of oil. and then concentrated nitric acid, free from hydrochloric, is added; the silver salt crystallizes out while the copper remains in solution. The precipitated salt is then washed two or three times with concentrated nitric acid to remove any adhering copper salt, which gives it a bluish shade. On drying. any acid attached to it is evaporated. It is essential that the solution he evaporated only to the consistency of oil, for if evaporated to dryness, the copper salt adheres so firmly to the silver that it can with difficulty he removed. The more concentrated the acid. the more completely the silver will he precipitated, hut an acid with a spec. gr. of 1.25 may he used for completely separating the two metals. Three or four parts of concentrated acid are required for one part of the concentrated metallic solution.

Discovery of a New Species of Whale.—In a letter to Mr John W. Strauchon, Professor George W Davidson informs him that the petrified whale bone taken from tbe artesian well which is heing eunk hy Messrs. Calloway & Co. in this city, has been proved a portion of a whale of a new species hy the savans of Philadelphia Academy of Natural Sciences. The Professor is desirous of obtaiuing additional portions of the skeleton if possible to present the same to the above institution, of which he is a member.—*San Diego Union.*

Recent Geographical Work on the Pacific Coast.

We eelect the following items from the *American Journal of Science* for May:

Report of the Eng. Corps, U. S. Army.

This report was presented to Cougress last Decemher.

Nevada and Arizona.—The explorations nnder Lieut. Wheeler, hegun iu 1869, have heen in progress during the past year.

Alaska.—Captain C. W Raymond has made a reconnoisance of the River Yukon His report, with a map of the river, has been printed separately by Congress.

Fortieth Parallel.—King's survey is still in progress. A clear account of all the work hegun from March, 1867, to Oct., 1871, is given in the report, from which we extract the following as to the methods of work, problems investigated and chief results:

"The foundation of our explorations have heen a continuous system of triangulation, carried from mountain-top to mountain-top, and the whole extent of our work, hy theodolite observations upon stone monuments. Within the primary triangles a large number of secondary triangles are located, and from these, working always inwardly, a thorough system of minor triangles. In connection with this, the altitude of all prominent mountain-peaks and localities upon the plains have been determined.

"In the department of geology, careful and actual sections bave heen made over the whole area; the superposition of the immense variety of irruptive rocks has been, in almost all cases, accurately determined; the dynamical questions, such as the build of mountains, the upheaval of chains, and the formation of mining districts and of mineral-bearing lodes have received careful attention.

"In botany a very large collection has been made, resulting in the discovery of over 100 new species of plants, in a complete knowledge of the distribution of timber and of the leading families of the desert flora.

"In zoölogy the collection has heen equally careful and the results are of interest and value.

"The work embraces a complete scientific examination of a section of country which traverses, from east to west, nearly the entire Cordillera system. The rocks at our eastern terminns are already those of the Atlantic formations and are heing extensively studied hy a number of geologists.

"In mining industry our lahors have been worked up and the volume and accompanying atlas printed. Also, the topographical maps are plotted on a scale of 2 miles to the inch, and have been photographically reduced to a scale of 4 miles to the inch, resulting in three maps, about 30 or 40 inches each. These are now being drawn in *hachure*, preparatory to lithographing.

"The volume of botany is completed [and published]. That of geology is also completed and awaits the printer. To complete the series I propose two more volumes: one of descriptive geology and one embodying general results. The former is now in active preparation and the maps accompanying it are in the hands of the engraver. For the general volume I am unable at present to fix a definite time. When finished the series is designed to embody,

"1. A ground-work topographical map upon which shall appear all the features of the country surveyed.

"2. A series of geological maps, illustrating the formations of rocks, soils, alkaline deposits, and the distribution of arable land.

"3. A general report which, in a synthetical manner, shall describe the history of the formations of that portion of the Cordillera, its original deposition in the primeval ocean, the evolution of continental features and mountains, the minute lithological structure of each family of rocks, and chapters upon the volcanic and glacial ages; and an attempt to explain the present physical conditions, and an account of the considerable climatic change now going on.

"As appendices to this, the 2d, 3d, 4th and 5th volumes will treat of technical geology, zoölogy and mining industry."

River Surveys, more or less in detail. have heen made in various regions; including the Willamette, tbe Umpqua, and portions of the Sacramento.

Yellowstone Geysers.

The most valuable sources of information which have come under our notice are as follows:

1. A picturesque description of the Geyser region, hased upon the observations of the Washburn-Langford party, printed in *Scribers Monthly* in 1871.

An account hy Walter Trumhull of the Washhurn Yellowstone expedition appeared in the *Overland Monthly* for May, 1871.

2. Reconnoissance by Capt. J. W. Barlow, U. S. Corps of Eng., made in 1871; published hy permission in several newspapers of Jan. and Feh., 1872.

3. Railroad reconnoissance of the valley by Gen. W. M. Roberts, Chief Eng. N. P. R. R., made 1871; printed by the railroad company but not yet published.

3d. The reports of Dr. Hayden's visit in 1871, with two maps; also prepared for publication ou a large scale.

Preliminary report of the U. S. Geol. Survey of Montana, and portions of adjacent Territory, heing a fifth Annual Report of Progrese, by F. V. Hayden. U. S. Geologist. Conducted under the authority of the Secretary of the Interior, Washington, 1872. This gives an account of his explorations in the Geyeer regions, with notes on the geology on his route from Utah through Idaho and Montana; it contains, also, reports on the physical features

A FREAK OF NATURE.

and conditions, the geology and the natural history of a considerable part of the Rocky mouutain region.

Route of the Northern Pacific Railroad.

This region was first made known hy the journey of Lewis and Clark, in 1804–5 and 6, was surveyed by Geu. I. I. Stevens in 1853–4 and 5 (report published as vol. XII, pt. 1, U. S. Pacific Railroad Report); and was carefully examined hy Capt J. Mullan (who huilt the military road from Fort Walla Walla to Fort Benton in 1862), whose report was published by the Government in 1863.

1. The N. P. R. R. last year published (?) Gen. Robert's report of the reconnoissance in 1869, of the route. The same engineer was engaged in 1871 in examining the Rocky Mt. Divide between Lewis and Clark's Pass on the north and Deer Lodge Pass on the south, a distance of nearly 100 miles, covering all the passes of the main channel available for the railroad. We snbsequently went dowu to the Yellowstone as mentioned before.

2. At the same time Gen. F. L. Rosser surveyed a route between the Missouri, at Fort Rice, and the Yellowstone.

3 Mr. F. Wilkeson also made last summer a geological examination of the region between Cadott's Pass and Deer Lodge Pass, with reference to the occurrence of coal and iron.

4. Mr. C. A. White has heen across the Grand Plain of the Columhia and through the Grand Coulée.

(These four reports have been presented hut not yet puhlished).

Transportation Routes in Minnesota and Dakota—Colorado Expedition.

A very interesting map of transportation routes in Minnesota and Dakota, including railroad, mail and express routes, has just heen prepared hy Gen. S. R. Hotahids, Chief Quartermaster of the Department of Dakota, and published in a scale of 10 miles to the inch.

Major Powell's Colorado expedition in 1871 passed through the cañons of Green River and of the Colorado to the month of the Paria, at the head of Middle Cañou. On the way the party explored the region west of the rivers named, tracing the large hranches to their sources, and examining the geology of the great mesas and cliffs. Early in the winter a base-line, 47,000 feet long, was measured in a meridian running south from Kanab, and the party is now triangulating among the peaks and cliffs of lateral cañone of the Colorado. Many prehistoric mines, stone implements, etc., have heen found; also a tribe of Utes in the Kaibah Plateau who still make stone implements.

Curious Freak of Nature.

The accompanying drawing represents a Radish curiosity, (size of the sketch,) grown in the garden of T. Hart Hyatt, Oakland, the present season. The two radishes tied themselves together, as shown, without aid. Whether it is a matrimonial knot, or not matrimonial, we cannot say.

The Mines of New Mexico.

From recent accounts from Silver City and other mining regions, the fact, which we have often hefore enunciated is now becoming more and more ohvious. To render New Mexico one of the richest mining regions in the Union, it needs but capital, machinery and enterprise. True, skilled lahor, and protection for life and property are also needed, but all of theee latter will follow capital and machinery. We have no hesitation in eaying that for the surplus capital which now lies idle in the States awaiting an opportunity of profitahle investment there is no hetter field than the mines of New Mexico. Its wealth in minerals cannot be overestimated, nor is its wealth confined to minerals. With a climate unsurpassed on the American Continent and a eoil whose richnese is proverhial, the agriculturist, the stock-raieer, aud the vinter—for whose business its climate is especially adapted, are invited by an undeveloped oountry and a lavish profusion of nature's richest hlessings to come here and establish homes for themselves and their posterity and in so doing reap the harvest of prosperity.

The people in our mines are thrifty, enterprising and hopeful for reinforcement; hut they need the capital to their friends elsewhere, conjointly with their willing lahor, to give the nation the benefit of the wealth within sight and to give an unnsual profit to all engaged in its developments.

The passage of the Denver and Rio Grande aud also the Texas and Pacific railroad bills, will give assurance, that hut few years can pass hefore capital and immigration will pour iuto the country. Meantime, though the need of capital is sorely felt, and if those having a eurplns of it at their command would give the merits and advautages of onr mining localities a fair trial, we are sure the examination would lead to inveetment and the investment to a rich and certain profit. Of the future of our mineral sections we neither have, nor reasonahly could have any douhts. Still we are anxious that our claims should be known and that eastern capital now lying idle and nnproductive may have an opportunity to increase itself as well as aid the enterprising frontiersmen who are now struggling so bravely, and against such odds, to spread civilization, commerce and enterprise over this rich, but much neglected portion of the Union.—*Santa Fe Post.*

Japan.—The recent great fire in Yedo, Japan, destroyed all the houses within an area of four miles long by three wide, and contrary to the usual custom there, where large fires occur frequently, the city will he huilt up again in a more substantial and civilized manner. A new survey is to he made, the streets widened and the huildings to be of brick. There is little doubt but that the Japanese will see the evident superiority of our steam fire engines over their inefficient system and will order a number of them from this country. Their progress is very rapid and they manifest an earnest desire to become familiar with all the the implements of modern civilization, which they substantially prove by their large orders from the United States.

Useful Information.

Carbolic Acid and Its Applications.

One can hardly pick up a paper now-adays without finding some reference to carbolic acid, a word which, until quite recently, it was difficult to get printed without having the *l* changed to an *n*. The valuable uses of this agent are making it very generally employed, and for the benfit of our readers we give (from the *Industrial Monthly*) some remarks concerning its character and applications.

The beautiful anilino colors, many favorite essences and perfumes, and the best disinfectant of modern times, carbolic acid, (called also phenol, phenyl alcohol, phenic acid and coal tar creosote,) are all prepared from coal tar.

Pure carbolic acid is a white crystalline substance having a powerful smoky odor. When exposed to the air it absorbs water and becomes liquid. It is soluble in water, alcohol, ether and glycerins, its combination with the last being one of the most valuable preparations of its class. A strong solution of carbolic acid attacks the skin of the lips, and even produces a disagreeable feeling where the skin is much thicker, so that great caution should be used in employing it as a wash.

It is as a disinfectant, however, that carbolic acid has proved most valuable, its power in this direction being undoubtedly due to its property of coagulating albumens. That it has the power to prevent contagion, was proved very clearly by Mr. Crookes, who found it a most complete destroyer of the infection of cattle plague. A Commission of the French Academy of Science reported that hyponitrous acid was the most efficacious of all disinfectants used in their experiments, but that carbolic acid was nearly as good, while it is far more easily applied and far less dangerous and expensive. While chlorine and the hypochlorites entirely failed to deodorize the gases from the bodies at the Paris Morgus during the heat of summer, carbolic acid proved perfectly efficacious. According to M. Devsrgie, water containing only the 1-1000th part by weight of carbolic acid completely disinfected the deadhouse in the hottest weather, even when it contains six or seven bodies.

There are various methods of applying carbolic acid, all founded upon its property of vaporizing in combination with water at ordinary temperatures. Thus, it may be mixed with water and sprinkled over the floor and walls of dwellings or stables. As, however, the solution produces disagreeable stains, and it is difficult to remove the odor afterwards, it is better to sprinkle the liquid over sawdust or sand contained in shallow pans which are placed in the apartments to be disinfected, or the liquid may be sprinkled over waste cloth hung up in the rooms. For washing animals or even the human body, carbolic-acid soap is an excellent form in which to use the disinfectant, and it has even been applied in the preparation of wrapping paper used for the preservation of meat.

The odor of carbolic acid is very powerful, and, to some persons, exceedingly disagreeable. It may even be questioned, whether it is altogether healthy, since we know that in a concentrated condition it proves rapidly destructive to life. Some years ago, an attempt was made to substitute carbolic acid for carbonic oxids in the Gamgee process. No difficulty was found in slaughtering the animals, by exposing them to air slightly impregnated with carbolic acid. A bird, a dog and a sheep, were successively killed, and then an ox was tried. He became a little obstrsperous, but finally succumbed. The question now arises, to what extent may air be impregnated with carbolic-acid vapor, without being rendered unhealthy? In regard to this point, we know of no reliable experimental investigations. That in certain common cases, it is powerfully destructive of animal life, is well known, and consequently we find it extensively used for the remains of certain annoying parasites, which infect man and other animals. For the removal of fleas and other pests from dogs, cats, sheep, etc., a strong wash of carbolic-acid soap is the best agent yet discovered.

What Shall A Workman Study?—"In Lectures in a Workshop" in the *Industrial Monthly*, T. P. P. says: If there is any doubt about what study or studies should be followed with a view to self culture, we can remove it by a simple rule given in these words, namely: *Study your business.* By this the daily bread is to be earned; and it is highly probable that the knowledge of the trade engaged in exceeds the information on all subjects outside of it. Many men are continually attempting too much, and worry because they cannot swallow whole volumes of literature and science in a few months; they are apt to slight their daily occupation as an unavoidable means of maintainance and concentrate their efforts upon something quite foreign to their trade. Such men have mistaken their calling, and are wasting their time so far as self-improvement goes.

An Acoustic Experiment.—Let a wide glass tube, open at both ends, be taken, and in this a piece of fine wire gauze be pushed up some little distance. If the gauze be now heated to red hotness over an ordinary Bunsen burner, and then removed, it will shortly emit a shrill note, lasting from five to ten seconds. The experiment will be new to some of our readers, and has the merit of always going off.

To Prepare Skeleton Leaves.

Mr. J. F. Robinson describes in *Hardwicke's Science Gossip* a simple method of preparing skeleton leaves, which seems preferable to the old and tedious method of maceration, and which he recommends to all young botanists, especially to his fair friends, who take up the science of botany more as an intelligent amusement than for severe study. First dissolve four ounces of common washing soda in a quart of boiling water, then add two ounces of slaked quicklime, and boil for about fifteen minutes. Allow the solution to cool; afterwards pour off all the clear liquor into a clean saucepan. When this liquor is at its boiling heat place the leaves carefully in the pan, and boil the whole together for an hour, adding from time to time enough water to make up for the loss by evaporation. The epidermis and parenchyma of some leaves will more readily separate than others. A good test is to try the leaves after they have been gently boiling for an hour, and if the cellular matter does not easily rub off betwixt the finger and thumb beneath cold water, boil them again for a short time. When the fleshy matter is found to be sufficiently softened, rub them separately but very gently beneath cold water until the perfect skeleton is exposed.

The skeletons, at first, are of a dirty white color; to make them of a pure white, and therefore more beautiful, all that is necessary is to bleach them in a weak solution of chloride of lime—a large teaspoonful of chlorids of lime to a quart of water; if a few drops of vinegar is added to the solution it is all the better, for then the free chlorine liberated. Do no allow them to remain too long in the bleaching liquor, or they will become too brittle, and cannot afterwards be handled without injury. About fifteen minutes will be sufficient to make them white and clean looking. Dry the specimens in white blotting paper, beneath a gentle pressure. Simple leaves are the best for young beginners to experiment on; the vine, poplar, beech and ivy leaves make excellent skeletons. Care must be exercised in the selection of leaves, as well as the period of the year and the state of the atmosphere when the specimens are collected; otherwise, failure will be the result. The best months to gather the specimens are July and August. Never collect specimens in damp weather, and none but perfectly matured leaves ought to be selected.

Stretching Tracing Paper.—The thin transparent tracing paper, used by architects and draughtsmen, can be stretched or be mounted so as to give a fine even surface, on which water-coloring and shading can be done as easily as upon mounted paper. Cut a piece of drawing-paper the size of the drawing-board; gum the upper surface, edge of the board, about ½ inch in width; spread the tracing-paper carefully over the drawing, and smooth down on the gummed edge; then turn the sheet back, and gum the remaining three edges of the board; bring over the tracing paper and smooth down the edges; do not pull or twist the sheet, so as to get it tight or severely strained, but get the edges well held down by the gum. After the gum has dried, a clean sponge, well saturated with water, may be passed over the entire surface, except on the gummed edges. The tracing-paper expands and blisters all over, but in a few minutes the dampness evaporates and a beautiful surface is presented, similar to a transparent slate. The tracing can now be colored or shaded as on drawing-paper, and any blots or errors can easily be washed out.—*Ex.*

Effect of Food on the Taste of Fish.—Since the introduction of coal oil refineries along the the Schuylkill and Delaware, the original fine flavor of the shad caught in these rivers has been materially injured, partaking of the rather unpalatable taste of kerosene. Seth Green, who is one of the best authorities on the fresh fish question in this country says "The flesh of fish will taste of kerosene if caught in any stream in which the refuse of kerosene oil refineries is allowed to run."

India Rubber Liquid Blacking.—Take of ivory black, sixty pounds; molasses, forty-five pounds; gum arabic, dissolved in a sufficient quantity of hot water, one pound; India rubber, dissolved by the aid of heat in nine pounds of rape seed oil, eighteen ounces; mix them well together. This blacking may be applied by means of a small sponge, attached to a piece of twisted wire, like the well-known Japa blacking.—*Scientific American.*

Caution.—Wherever iron pipes are employed for conveying any heated medium, such as smoke, hot air, steam, or hot water, they should not be allowed to pass through woodwork unless protected by an earthen crock. The iron rust may be reoxided by heat, and upon reoxidizing it often becomes red hot. Many fires have occurred from this cause.

Coal Mines.—The *Mercurio*, a paper published in Chile, reports important discoveries of coal along the gulf of Arauco, particularly on both banks of the Carampangue River, near its mouth, where they intend working the mines. The coal is of passable quality and said to be found in abundance.

In making the railroad grade across the island near Rock Island, it is said geological evidences were found indicating that the Mississippi once covered it with a depth of fifty feet of water.

Good Health.

Physiological Effects of Coffee.

An interesting communication was recently made at a meeting of the Academy of Sciences in Paris in regard to the value of coffee as an article of food. Attention was called to a statement of Mr. Gasparin, in 1850, that the miners of Charleroi preserved their health and great vigor of muscular force, by the use of less than half of the nutriment indicated as necessary by theory and daily observation. Using food containing less nitrogen and carbon than the daily ration of the monks of La Trappe, whose countenances are pale, and who exercise scarcely one-fifth as much as an ordinary workman, these Belgian miners were more industrious and energetic in their labors. The secret of the difference was stated by Mr. Gasparin to consist in the use every day by these miners of a pint of an infusion of about an ounce of coffee, prepared in two quarts of water, which served the purpose of counteracting the injurious effect of an insufficient supply of food.

Reference was also made to an experiment in 1860, by Mr. Jousand, in which, by the use of a decoction of about an ounce and a half of powdered coffee, a young man was kept, with no other food whatever in good health and strength for seven days, during which time he took more active muscular exercise than usual, without any special inconvenience.

The particular deduction from these experiments appears to be that coffee has an important action in preventing denutrition and emaciation. An illustration of this is seen, according to the author, in the effect upon the urea. In one experiment, about half a grain of caffein was consumed daily, and the amount of urea was diminished 28 per cent.; while an infusion of about two ounces of roast coffee diminished it by 20 per cent. This is asserted to be the result by very careful experiments of a physiologist upon himself, proving that caffein and roast coffee diminish the oxidation of the system, and temper the process of denutrition. The excessive frequency and intensity of the beating of the heart was also found to be reduced in several instances. It is probable, according to the author, that a similar action is exerted by some other substances—the Paraguay tea, especially, which, it is well known, enables the natives of the Andes to subsist for a long time on an incredibly small amount of food.—*Harper's Monthly.*

Patent Gas Company.—The *Money Market Review*, of London, April 20th, contains a notice of a new invention which promises to open a new era in gas manufacture, and of which an eminent gas engineer says:

"This process must sooner or later be adopted by all existing companies." The inventor claims as its chief advantages, as compared with the gas supplied by existing companies, that it has but six grains maximum of sulphur impurities per 100 cubic feet, and gives 11,500 cubic feet of 20 candle gas per ton of coal, in lieu of 9,500 cubic feet of 14 candle, as given by the ordinary process. In other words an illuminating power of 46,000 standard sperm candles instead of 26,000, being a net gain of light equivalent to 72½ per cent. The cost of production by the patent process being sixteen pence per 1,000 cubic feet as compared with twenty-one pence, the cost of the ordinary process.

A Mouse Afflicted With Small-Pox.—The New York *Standard* of May 6th, is responsible for the following:—On Friday evening a lady entered the drug store of Dr. Edward Lindridge, on Hudson avenue, near Sands street, Brooklyn, and placed a live mouse on the counter. The little animal had a very sore head, and the doctor was asked whether he knew what the matter was. He was also informed that it had been brought from the tenement house, 156 Hudson avenue, near York street, where there have been several cases of small-pox. After examining the mouse he found that it was covered with sores. He sprinkled some disinfecting powder over it and in a short time it died. It was then dissected, and a clear case of small-pox in its worst form was revealed. The remains were inclosed in a glass jar, and are to be sent to the hospital for further examination, as it is believed to be the first case of the kind ever heard of.

Editors Press:—Some time since I read in your columns, of a cure for "dandruff" which consisted simply in wetting the hair with water in which sulphur had been steeped. Being troubled with dandruff, and thinking the experiment at least harmless, I tried it, and it succeeded perfectly—there is now no dandruff on the scalp. The water has acquired a slightly acid taste, but I have not the time to ascertain exactly what change has taken place. The fact, however, may be useful to some of your readers.—E. H. A.

Tomato Custard.—This is said to be a beneficial diet for consumptives. It is made by straining finely stewed tomatoes through a course seive, and adding two pints of milk and one pint of tomatoes, for four eggs and one teaspoonful of sugar. Bake in small cups quickly.

Care of the Eyes.

There comes a time when normal eyes find their powers grown limited, and require more light, or assistance from glasses, when looking at small or near objects. When this period arrives, it is an error to persist in endeavors to do as formerly with the eyes; but much use must be avoided, except in a clear light, or with the required auxiliaries. It is also a mistake to suppose that glasses should not be worn while it is possible to avoid doing so. On the contrary, they serve to prevent straining of the eyes, and preserve rather than injure vision.

Certain defects of refractive power are due to malformation of the eye, either existing from birth or acquired afterward, and are not to be removed by remedies or manipulations. It is a mischievous error to suppose that the form of an elastic globe, filled with fluid or semi-fluid substances, can be changed except for a moment, by pressing upon it with the fingers, as has been recommended by charlatans. All the theories that the eye can have its form favorably modified by rubbing it always in one direction, or by any other manipulation, have no foundation in facts. But while persistant squeezing, according to these methods, can never do any permanent good, it involves great risks. It may lead to congestion and hemorrage within the eyes; or give rise to destructive inflamation, or formation of cataract, by dislocating the crystalline lens; or cause almost immediate loss of sight, by the separation of the retina from its neighboring parts; or increase the giving way of the back part of the globe, which is already often begun in near-sighted eyes.

The same warnings will apply with equal force against the use of eye-cups fitted with rubber bulbs, to alter the form of the eyeball, as is asserted, by suction. Valueless and dangerous as they are, persons are often persuaded to purchase and try them—sometimes to their sorrow.—*Atlantic Monthly.*

A Novel Theory.—A German physician has lately started the theory that the fearful disease known as small-pox originates from an excess of albuminous matter in the blood, and that this is to be prevented by the administration of common salt. The habits of children in indulging too freely in sweetmeats be considers one great cause of this undue development of albumen, and coffee and tea if highly sugared, tend also to excite it in adults. An organic acid, such as lemon juice, he considers the best means of freeing the blood, when clogged with too much albumen, and he alleges that by taking these simple remedies in the way of precaution, he has, for upwards of twelve years past, frequented or taken up his abode in the most pestilential small-pox hospitals of Europe and South America with entire impunity.

A Victim of Hair Dye.—Thomas Minshall, a young man residing in Chester, Pa., was terribly poisoned a week or two since by a species of hair dye in common use among barbers everywhere. While coloring his mustache the barber suffered a drop to fall upon his lower lip, which was slightly chapped. In a short time after the part began to swell, became inflamed to an enormous size, and his face presented a shocking appearance. Convulsion after convulsion followed, and for some days his life was in great jeopardy. Within the last day or two, however, the swelling has somewhat subsided and he is in a fair way to recover.—*Yreka Journal.*

Wet Clothes.—Few persons understand fully the reason why wet clothes exert such a chilling influence. It is simply this: Water, when it evaporates, carries off an enormous amount of heat, in what is called the latent form. One pound of water in vapor contains as much heat as nine or ten pounds of liquid water, and all this heat must, of course, be taken from the body. If our clothes are moistened with three pounds of water, that is, if, by wetting, they are rendered three pounds heavier, these three pounds will, in drying, carry off as much heat as would raise three gallons of ice-cold water to the boiling point. No wonder that damp clothes chill us.

Soup for Invalids.—To a pint of warm water add three tablespoonfuls of cod liver oil, shake them until they are thoroughly incorporated. Take a clove of garlic, that has been steeped for some twenty-four hours in senna tea, and shred it into the liquid. Season with rhubarb and magnesia. Some add forcemeat balls of the same size—and of the same materials—as anti-bilious pills. Brown with a salamander, and serve up.

Scarlatina.—Mr. W. M. Searcy suggests the frequent examination of the tonsils of all persons living in a house where scarlatina is present, as the redness and enlargement of those organs are premonitory symptoms of the disease. Nitrate of silver in solution—one dram to one ounce distilled water—is a good local application, and if the case be severe, aperient medicine is used in conjunction therewith.

To Remove Warts.—Apply to the wart with the end of a knitting needle a little fuming nitric acid, to be had of the apothecaries. Repeat the application once or twice, and in two or three days the excrescence will come off without leaving any mark.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line; first insertion, 1s.; subsequent insertions, each, 8d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Saturday Morning, June 1, 1872

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, May 29, 1872.—Legal Tenders buying, 89; selling, 90. Gold in New York to-day, 114.

Table of Contents.

EDITORIALS.—The Danks' Puddler—Unexpected Difficulty; Arizona Affairs, 337. The Future of the Pacific Coast; Shipping Wheat in Bulk; Whisky from Tule; 338. Norton's Door and Gate Spring; Niles' Station Bridge, 342. Mining as an Investment—Concluded; Clay Street and Russian Hill Railroad, 344. The Foye System of Binding Buildings, 345.

ILLUSTRATIONS.—Hungerford's Improved Water Wheel, 337. A Freak of Nature, 342. Calcarone Furnace, 345. Toys for Children, 346.

MECHANICAL PRO RESS.—More About Lubricators; Wall Paper Impressions; Boiler Coating, 339. Steam on City Railroads; Why Railroad Bridges Break, 339.

SCIENTIFIC PROGRESS.—New Sensitive Singing Flame; Varieties of Matter; Aniline Colors Poisonous; Effect of Colored Light on Vegetation; Auroral Displays in the U. S.; Parchment Fluid. 339.

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory. 340-1.

USEFUL INFORMATION.—Carbolic Acid and Its Applications; What Shall A Workman Study?; To Prepare Skeleton Leaves; Stretching Tracing Paper; Caution, 343.

GOOD HEALTH.—Physiological Effects of Coffee; Patent Gas Company; A Mouse Afflicted With Small-Pox; Care of the Eyes; A Novel Theory; A Victim of Hair Dye; Wet Clothes, 343,

DOMESTIC ECONOMY.—Kindling Coal Fires; The Best Way to Keep Potatoes; Melton Veal; Dutch Cheese; To Purify Dairy Utensils; Selected Receipts; Cut Flowers; Potatoes, 347.

MISCELLANEOUS.—The Vintage of 1871; New and Curious Building Materials, 338. Recent Geographical Work on the Pacific Coast; The Mines of New Mexico, 342. Patents and Inventions; Meetings and Elections; Bank Blasting at Dutch Flat; New Incorporations; Decision in Patent Case; Yield of Comstock Mines, 348.

THE CENERBURG MINE.—The *Stars and Stripes*, in speaking of this mine which produced the fine specimens we mentioned in a recent issue as on exhibition in a jeweler's window, on Montgomery street, says: "This marvelously rich streak is in a stringer of quartz three to six inches wide, which, as it descends, is pitching toward the main channel at an angle which favors the presumption that a junction will be formed at a depth of less than 100 ft. The main ledge is over 4 ft. thick, and is, through its entire developed extent, composed of high grade milling rock. A mill is shortly to be erected." The *Stars and Stripes* speaks favorably of the mine, and we understand that the specimens at J. M. Seaman's, in this city, will be disposed of on the 1st inst., either as a whole or to parties desiring one or more for their cabinets.

EXPERIMENTAL LECTURE.—Prof. E. S. Carr will lecture before the Oakland Farming Club on Friday evening, May 31st, on "Water," its various conditions and modifications, and its assimilation in the growth of vegetation. Several interesting experiments will be given. After a short lecture, the subject of irrigating trees will be discussed by members of the club.

A SMELTING furnace at Salt Lake uses one thousand bushels of Truckee coal per day. The Salt Lake demand amounts to over 3,000 bushels per day.

SIX hundred and eighty bars of base bullion, from the Cerro Gordo mines, were received in Los Angeles on the 23d inst.

THE new furnaces of the Valley quicksilver mines, at Pope Valley, will be put in operation about the first prox.

Mining as an Investment.

[Concluded from our last issue.]

Risks in Mining.

There is some force in the remark that mining is more risky than any other business, but in justice it should be conceded that this risk is attached to everything else. There is no more speculation in it than in other pursuits. As an investment it may not only be trusted in for dividends but for high rates of interest, provided, always, that it is pursued like other business callings, for legitimate production; since mere scheming in stock transactions divests it of its purely commercial character, and frightens persons from embarking in it whose money would otherwise be available. There is, nevertheless, as much certainty of return, and more certainty of a large increase than anything else, and it may be looked to for large, regular and never-failing returns. A more practical application of science to mining should be made, and a diffusion of more general and correct knowledge among miners as to the best method of opening mines, working ores, etc. Good mining engineers are, however, not to be picked up every day, but even then it is not necessary to send a lawyer, clerk, carpenter, broker or anybody that is convenient to superintend a mine and suppose that he is competent to do it. It requires peculiar qualifications to manage mining property successfully, but what proportion of losses is due to recklessness, extravagance, deception or fraud, it is impossible to tell. An honest, attentive man of scientific attainments, and, if possible, local knowledge, is a treasure. The estimates, however, may be sometimes incorrect, for the lode may be deeper, or turn out poorer, or water may come in, or a "fault" be discovered; but even then the risks are no greater than they would be in building a railroad, tunneling a mountain, creating extensive irrigating works or building a canal. People invest in such enterprises and count a loss a business loss; but if a mine is not one of unbounded wealth, the business is characterized as too uncertain for legitimate investment. If there is more hazard, there is more chance of success. People have made fortunes in commercial pursuits—manufacturing, farming, etc.—but storms and fires come, and crops fail, and in the last instance it is even more disastrous than any mining venture could be, for not only a few, but many, are injured by the same catastrophe.

The lode fails less frequently than the crops, especially here in California, where drouths occur periodically; inundations do not happen so often as shipwreck, and the storm that sweeps over the lands and destroys building and crops, passes harmlessly over the miner; every cattle man, farmer and merchant and manufacturer is in more danger of losing his capital, without having the same chance of so glorious a result, or such sure ground to work upon. The farmer often spends as much in harvesting his crop as he afterwards gets for it, without taking his labor into consideration; and manufacturers frequently sell their goods even below cost price, but nobody would think of giving up business on these accounts. Why then should they decry mining because failures sometimes occur.

Certain Precautions Must be Taken,

However, to insure success. In selecting a claim there should be proof of actual existence, location and clearness of title. Mining is necessarily a slow proceeding. Starting off at the commencement of works at a new mine and accompanying mill, it will seldom occur that the latter will do much for some months, during which time funds are necessary. An approximate estimate should be laid before holders of stock not only of the whole cost, but the probable time the work will require for completion, and the amounts required at stated periods in the meantime; power of engine to be ordered, size and cost of buildings according to plans furnished, amount of stores to be ordered, or powder, candles, tools, etc., should all be discussed and legislated for at a general meeting of the stockholders. An estimate should also be furnished of the probable receipts which may occur in the interval which will occur prior to the next periodical assemblage, and if any unusual outlay is made let it be made at the risk of the Superintendent, except when arising from some imminent necessity, over and above what is directed at the meeting. In some cases holders are to blame for resulting adverse circumstances from their own carelessness in these particulars. The making of contracts for engines or supplies, with all matters pertaining to general management, may be safely left to the trustees, and the executive management remain with the periodically appointed officials. The general meetings of stockholders should be held at least once in three months, and the trustees then called upon to give a full and detailed account of their stewardship; and, above all, the Superintendent or trustees should give some account of proposed work during the following quarter, and no work or contract permitted unless the stockholders have perfect confidence in the Superintendent, or it is approved by them at the time. If, however, they only think of the value of the stock and not of the mine, and take no personal interest in the administration of affairs, no matter how much it is to be regretted on moral grounds, it is too much to expect sympathy for misfortunes attributed to their own negligence.

It can rarely happen that serious mischief can be done in three months either from improper expenditures, sinking, drifting or delaying either, for such a period. A diagram of the mine should be on hand for convenience or reference. As a usual thing all these matters are first designed by the Superintendent and carried into effect without the interference of the general body, although they are expected to foot the bills. Of course such a system implies the appointment of an honest and properly qualified Superintendent, but to expect practical advice on mining and metallurgical treatment from one only recently called from the counter, the desk, the stage or the ship, would be absurd; yet from such sources have they often been appointed, and as long as dividends came no questions were asked, no complaints made; although it may have been apparent from the manner in which the amounts were realized that the mines were being ruined. All outside expenditures should be withheld until the mine is sufficiently developed to ascertain its working value. Low grade ores can only be worked by careful avoidance of all unnecessary expense and under the best financial management. Monthly dividends are not so good in the long run as quarterly since it is often judicious for the Superintendent to put men at work for short periods in unproductive works for the general benefit of the mine, which can scarcely be done if dividends are expected monthly.

The Quartz Interest

Is of vital importance to this coast, and should be fostered accordingly, for wherever we find a successfully operated and paying mine we are sure to find activity and life in all branches of business. The miner's labor enriches the country and prepares the way for the farmer, mechanic, merchant and artizan. "Why do they always want to sell out?" may be asked. Because nearly every miner who owns and works a claim knows, or thinks he knows, where to find another, an advantage the capitalist does not possess. We must look closely to the mining interests of our State, particularly, and San Francisco should afford ample facilities for treating our ores and put an end to shipments eastward. If mining was abandoned entirely the commercial world would feel it severely, since money would soon become so scarce.

Metallurgical Knowledge

Should be more wide spread and more care taken in our operations, for we regard the wastage of the precious metals indifferently, when if a moderate degree of care, skill and ingenuity were employed, a great saving could be effected. It appears almost incomprehensible that an energetic and far-seeing people should permit the extraordinary waste that has been going on so long; but, unfortunately, the chief desire is to work the largest amount of ore in the shortest time, rather than to get a large quantity from it. The mining interests of the coast are the chief source of its prosperity, and a significant fact in proof of this assertion is that we were never so prosperous as when we mined most. Lode mining is to-day the most important industry we have, and recent developments prove that far from being only a temporary one, the present generation is, so to speak, merely sinking the shafts for future ones to start their drifts from.

Swamp Land Reclamation.

The Board of Swamp Land Commissioners was in session at Sacramento on the 24th inst., and was to continue in session until the important business presented before them was properly inaugurated.

President C. F. Reed, A. S. Bender and E. H. Staut, were present. G. W. Morgan was elected Secretary of the Board. Hon. S. W. Sanderson was chosen Legal Adviser of the Board. Swamp levee districts desirous of acquiring advantages under the Harvey Act, may now freely apply. Several districts are prepared to apply for the issue of bonds for reclamation purposes, and within ten days their desire will be fulfilled. It is supposed that the probable settlement of the *Alabama* claims will have a sensible effect on the operations of resident agents of English capitalists, who propose to invest in projects for the reclamation of swamp lands.

THE receipts of silver bullion at Salt Lake City, from Pioche, reach about $50,000 per day.

Clay Street and Russian Hill Railroad.

The proposition to run a railroad up Clay street so as to surmount Russian Hill, will, naturally attract considerable attention from the seeming difficulty in effecting the object; but when the plan to be adopted is known, these difficulties disappear, and the feasibility of the project becomes apparent. We called this week at Room 1, No. 621 Clay street, the office of the owners of the franchise, in order to fully understand the means to be employed in getting the cars up the steep grade of Clay street hill. The cars are to start at the corner of Clay and Kearny streets, and run to Jones street on a double track, and are to be drawn up the ascent by means of an endless steel wire rope three inches in circumference, which runs constantly in a tube-shaped channel placed underground between each track. The wire rope will run on rollers which support it below and at the upper crossings of the street, other rollers are to be placed to keep it down in proper position.

On the whole length of Clay street from Kearney up, in the middle of each track is to be a slit or opening seven-eights of an inch wide at the top of the tube, in which the shank of a peculiar and ingenious "grip" travels. The patent grip consists of an L-shaped frame which is attached to the car so as to extend down through the slot into the groove in which the propelling rope travels. The grip is attached to the lower end of a slide, which moves up and down in the frame so that it can be raised or lowered as desired, and means are provided by which it can be detached from the rope at will from the platform of the car.

There are to be four tenders, each having one of these grips attached; the tenders are constructed so as to be connected to the ordinary light street cars, a spring being placed between them to take off any shock which might occur in starting. It is expected that these cars will run about every ten minutes, or oftener if desired, and the trip from Kearny street to Jones street will be made in six minutes. The whole distance is two thousand eight hundred feet, and the elevation attained three hundred and seven feet. From that point horses are attached to the cars, and the road runs to the western portion of Russian Hill, the present terminus being Larkin and Chestnut streets.

Motive Power.

There will be a twenty-five horse-power stationary engine at the corner of Jones and Clay streets, which actuates the rope by means of an eight-foot grip pulley placed horizontally. An eight-foot pulley is also to be placed at the intersection of Clay and Kearny streets. The rope being placed around these pulleys and moving through the tube between the rollers, it is readily understood that one rope will run up hill, and the other down between the proper track, drawing the cars with them. The difficulty heretofore has been to keep the rope underground at the street crossings, and to enable the cars to ascend with the variations in angles of grade. This is accomplished by an exceedingly simple and perfectly safe gripping attachment heretofore referred to, which is entirely under control of the conductor, so that he can stop or start on any portion of the line of track. When the car reaches the top of the hill, the tender or truck carrying the gripping attachment can be removed and the horses hooked on without delay, the passengers continuing on the same car to their destination. The gauge of the track is to be the same as our other street railroads.

Cost.

The cost of the road on Clay street between Kearny and Jones streets will be about $75,000 or $80,000, and while it is believed that it will ultimately pay its way,

the projectors do not expect returns on that amount of invested capital. The benefit to property holders and residents on the hill will, however, be great, since on account of the steepness of the ascent the locality is difficult of access, although healthy and commanding a fine view. The owners of the franchise are Messrs. Hallidie, Davis and Britton, and as soon as the necessary subscriptons for fitting up the road are forthcoming, the work of construction will begin. Those who are interested in this project, which will probably do away with the use of horses on steep grades, would do well to examine the model and plans of the projectors.

The Foye System of Binding Buildings.

We copy from the *N. Y. Sun* the following in reference to a late California invention for which letters patent of the United States were procured through the Scientific Press Patent Agency:—

The Board of Engineers for fortifications in New York, to which the War Department had referred an important patent recently taken out by Mr. W. H. Foye of San Francisco, has just reported. The invention not only secures life and property in earthquake countries, but also enables our architects to economize space in overcrowded New York. The invention briefly described is the binding of ordinary brick walls with vertical and horizontal iron bars, making the structure an indissoluble unit, for example, as a wheel is bound to its tires. The engineers' report is elaborate; its salient points are as follows:—

"In dwellings, warehouses, the shell and frame of churches, factories, and arsenals, the walls are of a slight thickness and (comparatively) great hight; isolated they would be of insufficient stability to resist even the force of the wind. Such structures owe their stability, not alone to the sufficiency of each part, but to their union as a whole. Any measure which will aid in binding the whole into a unit will be a benefit. Mr. Foye's system, besides adding to the ordinary stability of a building, gives greater security against shocks of earthquakes, and the falling walls of burning buildings in case of fire or other disturbing agencies."

The Board concurs in the report of Gen. Alexander to the Chairman of Committee on Public Buildings, Board of Supervisors, San Francisco, in which that gentleman says:—

"I think the principles upon which the invention is based are sound—it is particularly applicable to heavy stone structures—if skillfully applied will be found equally useful in ordinary brick buildings. The tying together of the foundation is very important, for whatever the character of the building, damage from disturbing causes will be less as the foundation approaches a unit. The vertical rods bind the top of the building to the foundation and afford to the top the resistance due the weight of the entire structure, and when combined with horizontal iron strong enough to keep the foundation from spreading will greatly aid in resisting subsidence, and giving that rigidity so necessary for the security of buildings. I am clear in my judgment that the value of such a building (if such iron were used according to the principles of the Foye patent,) would be enhanced more than the extra cost of the iron. The Foye system renders buildings more secure before and after a fire."

The Foye system of binding a building will doubtless be generally adopted within the fire limits of all large cities when its value is more fully known, but like all other improvements it will have to contend against the prejudices and theories of the ignorant in the profession in which it is classed. We have not space to give a minute description of all its merits, but will give some of its leading points.

The combination of the horizontal and vertical iron rods introduced into the walls binding the whole building into an entirety affords to each and every part the power of resistance due the weight of the whole structure. In case of fire (where a building is not wholly fire-proof the entire wood work might be consumed without serious injury to the walls, consequently when the wood work is replaced the building will be the same as before the fire. Firemen will feel a greater sense of security to fight fire in a brick building when it is known the wall cannot fall and crush them.

Within a few years past the valuable lives of eighteen of our citizens have been sacrificed outright by the falling of walls, and how many died from injuries received, after lingering for days, we have no means of knowing; but probably as many more.

In large cities where ground brings a high price and it is desirable to economize space, there is no system of building which will give the same satisfactory results as this; for it is easily demonstrated that a twelve-inch wall is stronger every way, and will sustain more weight upon its floors, if constructed on this system, than a sixteen-inch wall without it. The cost of labor and material saved will more than pay for the iron. Eight inches of floor room is saved to the owner, which is clear gain, and his building will rent for just that much more all the time, and probably insurance could be effected at lower rates on such a building. The gain in ground-room increases in favor of this system, when thicker walls are built.

Should the foundations of a building prove insecure the walls could not settle, provided a solid bearing remained at intervals, for the masonry must crush before such an occurrence; and being bound as a wheel by its tire, or a mill-stone by its bands, it is capable of resisting a much greater strain than ordinary masonry.

It is particularly adapted to factories where there is a constant vibration; caused by running machinery, and we venture to assert that if this system of iron binding had been incorporated in the walls of the different factories in the East, which have fallen and killed so many, within the past few years, we should be spared the pain of such occurrences, and that constant dread and feeling of insecurity of those living in brick buildings in consequence of earthquakes which sometimes occur in California, would no longer be felt. A building could be constructed of artificial stone (the Ransom or Frear) with great rapidity, and then moved off its foundation (if required) without injury to the building.

No engineer, architect, builder or practical man who pretends to a knowledge of the principles of construction, has examined this system without endorsing it.

We should think the people of Chicago might well appreciate this plan of binding in the rebuilding of that city. The right to use it should be owned by the city, and its use compelled by the fire Commissioners, in the construction of all brick buildings within the fire limits.

Mexican Gold.—The exportation of gold in bullion is now permitted by the Mexicans. A decree was recently passed which allows its exportation from ten of the principal States and from the Federal District. This policy will doubtless aid the development of mining property in Mexico and attract capital from outside its borders.

Winnemucca experienced an earthquake on the 23d inst. The reduction works at that place, which are being built by a French company, will be ready for work by the 1st of July. They claim to have a new process by which rebellious ores may be worked cheaply and profitably. A number of sales of mining property have been recently made at the above mentioned place.

Miners Wanted.—The North Bloomfield Gravel M. Co., are advertising for 35 or 40 miners. They are wanted, not only by this mine, but all over the country, and some of the idle men in our city could well be spared both with benefit to themselves and the community.

A dispatch from Eureka, Nev., states that tunnel locations under the new Congressional Mining Law are all the rage. The Eureka Consolidated smelting works are producing 20 tons of bullion per day, and the Richmond 10 tons. Several new furnaces are projected.

Patent for Mining Ground.—The Julia Gold and Silver Mining Company have obtained their patent to their ground, and the question of title is now settled. The protests of the Cobllar and Bullion Mining Companies were rejected by the Commissioner of the Land Office.

Crown Point.—The yield of the Crown Point mine last week fell off from the previous one nearly 1,000 tons, caused by trouble with water from the Yellow Jacket. The yield was 2,180 tons, valued at $67,800.

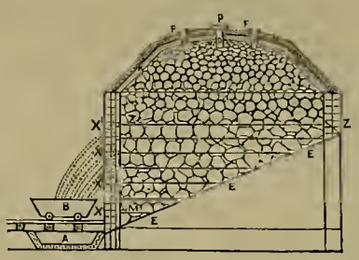
H. J. Booth, senior proprietor of the Union Iron Works, returned this week from a visit to the Eastern States, and the employés of the establishment gave him a serenade on the night of his arrival.

Ninety flasks of quicksilver were brought from the Redington mine last week.

Extraction of Sulphur from Its Ore in Sicily and Spain.

We give below an interesting description, with illustrations, of the method now employed in Sicily and Spain for extracting sulphur from its ores. The furnace by which the operation is performed is known as a Calcarone Furnace. The process is simple in theory, but requires considerable practical experience in its manipulation. The article was written by Mr. Henry Sewell, of Salt Lake City, the author of the letter which we published in a recent issue on the "Eberhardt, South Aurora, and Utah Silver Mining Company's Mines," and published originally in the New York *Engineering and Mining Journal:*

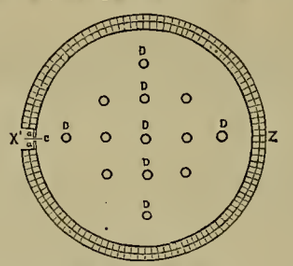
The dimensions of a calcarone differ much, according to the percentage of the ores; that is, the poorer the ore, the larger must be the furnace. When I commenced to use them in Spain, I found that furnaces about fifteen feet in diameter were the most successfully managed by workmen



Calcarene Furnace—Transverse Section.

not versed in the process; but I found also, that for economy, and a greater production in the smelting, a larger diameter, say 33 feet, gave the best results, and this is the size of the furnace in the accompanying plan.

The hight at *X*, on the front or tapping door, varies from 6 to 8, and even 12 feet (though seldom the latter). At *X X X* also, in the ground and vertical plan, an aperture reaching from the bottom to the top of the furnace exists, this is used for loading; but after that operation has been concluded, the aperture is closed with a



VERTICAL SECTION.

cast of plaster of Paris (or pieces put together), the thickness being only two inches. This thin door is built up new every time, and destroyed for discharging. It is used as a pyrometer, the heat easily piercing it, and indicates to the smelter how far the sulphur has *sweated* down.

In reality, this cannot be called a *smelting* operation, as no slag is formed, the heat being only sufficient to make the sulphur perspire out of the stone, leaving it in a spongy state. The ore is placed, in large boulders, just as it comes out of the mines, from the bottom to the middle of the furnace, which has a declivity of about 15 or 20 degrees, such being necessary at the end of the operation, in order that the last remnants of melted sulphur shall run towards the tapping door at point *M*. In loading the furnace, all the smaller-sized ore is reserved for filling the furnace near the top, where it is piled into the shape of a cone, as at *F F*, and chimneys are left at points *D D D*, about 2 feet deep. These are filled with brushwood, and in this way the ore is made to ignite. These hollows are left while piling the ore, and building the cone. The object of placing the small ore at the top, is simply to prevent any of the earth and sifted stone from falling through the large crevices that would be left, if large boulders were placed at the top.

The earth and sifted stone or gravel play an important part in the manipulation. At *K K* we have, immediately in contact with the small ore, a stratum of about 6 inches of small sifted gravel, about the size of a nut, and on this again, at *N N*, we have a coating of earth; this is to make the interior of the furnace as impermeable as possible to the oxidizing action of the air, and this coating is increased or decreased, according to the amount of heat required, which in turn depends on the strength of the winds, and their direction.

The brushwood ignited, the ore commences to burn, and the chimneys are kept open for about twenty hours, at the end of which period the ore has ignited all over the surface of the furnace, and to the depth of say, 15 or 20 inches. The chimneys are then all closed as follows: bricks are placed over them, as at point *P*; and sheuld the burning of the ore be too rapid, earth is then thrown over the bricks; but these chimneys are opened toward the middle of the operation, to increase the heat, and closed again, according to circumstances, to decrease it.

After forty-eight hours the melted sulphur begins to trickle down through the interstices of the stone, and congeals, forming as it were a conglomerate with the ore; the heat also travels downwards, and so we have remelting and congealing consecutively, till the sulphur arrives at the bottom of the furnace—forming a massive conglomerate of sulphur and ore; for it fills the interstices up to the point where the first tap-hole is drilled, through the thin door of plaster at point *X X X*. The lines across the furnace denote the lines or levels of tapping, and this commences naturally at *Z Z*, and so downwards, as the congealed sulphur is remelted with the descending heat. Every twenty-four hours a fresh tapping takes place, the former holes are plastered up, and a new hole drilled lower down, and so on till we get to the lowest point or bottom of the furnace. At the end of the operation, that is, during the last three days, nearly all the chimneys are left open, so that the air shall descend to the lower part of the furnace, and aid the combustion of the ore. The jet of sulphur is received into wooden moulds, as at point *B*. These are soaked in water to prevent the sulphur sticking to the wood, and are shaped wheel-barrow fashion, in order that the block of sulphur may easily fall out without breaking.

During the carrying away of a mould that has been filled, and the bringing of an empty one to be filled, the jet runs into a reservoir made for the purpose at *A*. One of the principal reasons for placing large blocks of ore, from the middle of the furnace downwards, is to leave sufficient interstices for receiving the sulphur, otherwise the first tap-hole would be too high, and near the ignited ore, thus setting fire to the stream of sulphur.

Two of the principal things to be guarded against, are overheating the furnace, and, on the other hand, carrying the process so slowly by the complete closing of the chimneys, that the operation would take two months instead of four weeks from the commencement. In the former case, instead of the sulphur congealing between the interstices, it would all be in a melted state from the top tap-hole to the bottom, thus not only consuming an unnecessary amount of sulphur in keeping up the heat of the furnace, but likewise giving, by overheating, a bad chocolate brown color to the sulphur. This quality would hardly be saleable, even for sulphuric acid. Any number of furnaces, say ten, after having been loaded, can be attended by two men, one in the day-time the other at night. As soon as the operation is over, which takes about a month, both apertures are opened to allow a current of air to pass through the furnace. Otherwise, it would not cool for a month; but by this precaution, a furnace can be discharged in a few days.

The new patent now being tried, is a large brick furnace of the same shape, hermetically closed, and arched over, and the sulphur is sweated out of the ore, by a constant jet of steam from a boiler.

Medical College of the Pacific.—This College constitutes a Medical Department of University College, under whose auspices was conducted the late successful course of lectures. The regular course of lectures in the Medical Department, of five months' duration, will be inaugurated next Monday evening, at 8 o'clock, by an introductory lecture by Prof. Clinton Cushing, in the College Building, 114 Stockton street, near Geary. All interested are cordially invited to attend.

Norton's Door and Gate Spring.—Bliven & Co. are manufacturers and proprietors of this invention instead of Davis & Bliven as mentioned in another column.

Domestic Economy.

Kindling Coal Fires.

We give below, from the *Journal of Heath* some hints with regard to kindling coal fires in addition to those given on page 27 of the present volume:—

Before coal kindles it must be heated through and through, made hot enough to blister the fingers in an instant, although still black. It is easy to see that a small bit of coal will get thus heated sooner than a larger one; hence the smaller the coal, the sooner it will ignite.

Coal must be kindled with wood. The wood will give out a certain amount of heat, and no more; and as a given amount of heat is necessary to kindle the coal, the more wood, and the less coal, and the smaller the pieces, the sooner and more certain will the fire be lighted.

In the face of these facts, persons are frequently seen in the rail-cars, when the fire in the stove is low, to put on a large amount of coal, the result being that the more coal put on, the more the fire will not burn, because the small amount of heat is distributed over a large amount of coal, all of which is heated some, but none of it heated enough for ignition. The more a coal fire is stirred, if a little low, the more certain it is to go out.

The best way to replenish a coal fire is to put on a small amount of coal while it is burning well; and after this is thoroughly kindled, and has been red for a short time, add a little more coal. In this way a fire may be kept burning a whole day in a grate without using the poker once; and good housekeepers know that every time a poker is used, the ashes fly in every direction, and valuable time is expended in brushing them up. If the poker must be used, the time to do it is when fresh coal has been thoroughly kindled, for then there is no danger of its going out.

If a coal fire is burning too much, either cover it with some of the ashes which have fallen through the grate—this makes the mass more compact, and diminishes the draught—or if it is desirable to put the fire out altogether, as when going to bed, press the coal down from the top with a shovel or blunt-edged poker.

It has been the custom to use the largest sized coal for the furnaces; this requires a great waste of wood in kindling, besides, much time is lost in firing up in the morning, the very time when most heat is wanted, and wanted quickly. It will take less coal, and give incomparably more comfort, to feed a furnace with coal, the largest piece of which is not larger than a hen's egg, only taking care to put on a little coal every hour. Observation and close calculating economy has shown this to all our river boats, tugs, and steamers.

The Best Way to Keep Potatoes.

Potatoes should always be kept in the dark. Intelligent rural housekeepers need not be told this; but many others, living in towns and cities, should know that potatoes exposed to the light for a day only, have their flavor injured; and the longer they are exposed the worse they are. Never use a greenish potato, as such tubers are unfit for human food. When Irish potatoes are removed from the cellar, they should always be spread out thin on the floor, in a cool building. If the apartment is not dark they should be covered with boards, to exclude the light. It is a good practice, also, to cover them with clean straw or sawdust. The injury done to potatoes by the light, after they are carried from a dark cellar, is the chief reason why there is such a universal complaint of poor potatoes in the spring and during the forepart of summer. Every sort of vegetable that grows in the dark—beneath the surface of the ground—should be stored in a dark apartment; while those vegetables and fruits which mature in the light, will ripen more satisfactorily, and develop a more luscious flavor, if they are stored in a light room.

Melton Veal.—This is a standard dish at the Melton Races in England, and is composed of alternate slices of veal and ham. Butter a good sized bowl and slice as thin as possible six hard-boiled eggs, then line the bowl with the slices. Place in the bottom a layer of raw veal steak in thin slices, and sprinkle over it a small quantity of salt, pepper and grated lemon-peel; proceed in the same way with thin slices of raw ham, but leave out the salt. Fill up the bowl in this manner. Cover it with a thick paste of flour and water, so stiff as to be rolled out. Tie a double cotton cloth all over the top and boil three hours, putting it into boiling water at the first, and keeping the water just below the level of the bowl. When cooked, take off the cloth and the paste, and let the veal stand until the following day; then turn it out on to a platter, and cut very thin after it comes to the table; garnish with sliced lemon and parsley. It is "a dainty dish" to set before a king. It is also delicious as a side dish for dinner, and makes a good breakfast.

Whitening Flannel.—Immerse the flannel for an hour in a dilute solution of acid sulphate of soda, and then stir in a dilute of hydrochloric acid in the proportion of one part of acid to fifty of water. The vessel is then to be covered over and allowed to remain for a quarter of an hour, when the articles are to be removed and thoroughly washed.

Dutch Cheese.

A correspondent of the *Rural New Yorker* wants to know how "Dutch Curds are made," to which it replies: We suppose this inquiry is concerning the making of what is known as cottage cheese, in some sections called Dutch cheese or curds. It is the curd of sour milk drained from the whey, pressed into balls or moulded in small fancy shapes, and eaten when fresh, or soon after it is made. Some people are very fond of Dutch cheese or curds, and the process of manufacture is so simple and so well known, that we supposed every "good housewife" was well posted in regard to its making.

The milk is allowed to sour and become loppering or thick, when it is gently heated, which facilitates the separation of the whey. The curds are then gathered up, salted or otherwise to suit the taste, and pressed in small moulds, or formed with the hand into suitable shape, when it is ready for the table, and may be used immediately. In cool weather, when milk does not readily thicken, the sour milk may be put in a suitable vessel set in hot water over the range. The milk is then stirred for a few minutes, when the whey will begin to separate, and it is removed and another batch may be treated in the same manner.

In summer some use large cans, having a spiggot near the bottom; the sour milk is placed in these cans, and allowed to stand in the sun to thicken. The heat of the sun will be sufficient to separate the whey, which may then be drawn off through the spiggot. The curds are then removed to a sink having a slatted bottom, over which a strainer cloth is placed. The curds thrown upon this strainer cloth are soon drained of the whey, when it is pressed into balls with the hand, or moulded into forms.

Sometimes this kind of cheese is potted and left to decompose, and when it has acquired a strong, villainous smell, it is regarded as most delicious by those who have acquired a taste for eating it in this state. In some markets cottage or Dutch cheese finds a ready sale, and quite a profit is made by certain butter-makers, in turning their sour milk into this product.

Washington Pastry.—A sojourner in Washington sends the following: I am particularly fond of lemon pie and ice-cream for dessert. At —— hotel I went on peaceably for a couple of weeks, but always eating lemon pie under a silent protest, for I was a stranger, and did not like to make objections. Finally, I called a waiter and said:

"John, I have nothing to say about the ice-cream, but what kind of a pie is this?"

"What kind of a pie did you order, sah?"

"I ordered lemon pie, but this appears to be dried apple."

"Dat's a lemon pie, sah. You know dey has a way of mexin dried apples in the lemon pies here, sah, to dat extent it requires a man of ability to 'stinguish 'em apart, sah. De lemons is scase, you know, and dey has to 'conomize 'em so as to make one lemon do for sixteen pies."

Fresh-caught Fish.—There is a white curdy matter very plainly seen between the flakes of fresh-boiled fish, which imparts much flavor to the fish. The excellence of the salmon broiled over a fire, or cooked on skewers, is doubtless due to the presence of a large quantity of this curdy substance, the fish being cooked as soon as caught. For this matter, which is defined as "a film of albumen produced by the coagulation of the serous juices intervening between the muscular layers," evaporates rapidly after the fish is dead; therefore fish are eaten in perfection only directly after they are caught.

Tomatoes in Iron Pots.—There are a thousand and one things I would like to know, (and probably shall, in time, unless I have to learn how to vote), but this I *do* know, that tomatoes must not be cooked in an *iron pot*. Some beneficient housekeeper, following in the footsteps of the illustrious "serapple" maker, gives a recipe in last week's *Rural* for a cheap soup, in which she directs the ingredients to be put in an iron pot. I sometimes, at good tables, taste tomatoes which have been made bitter by this process. If the intention is to medicate them, the result will satisfy the design.—*Rural New Yorker*.

Live within your means is a good principle to keep in sight in all matters of Domestic Economy. If your income is five dollars a day, spend but four. If it is one dollar, spend eighty cents. If it is but ten cents, spend nine. If it is three potatoes, save half a potato for seed. Thus you will gradually acquire something, while, if you spend and consume as you go, you will never get ahead one inch in life, but every sunset will look on you poorer than at sunrise, because you will have used unprofitably one day more of your strength and your allotted term of life.

Icing Pastry.—When nearly baked enough take the pastry out of the oven, and hold over it till the sugar is melted, a hot iron shovel. The above method is preferred for pastry to be eaten hot; for cold, beat up the whites of two eggs well, wash over the top of the pies with a brush, and sift over this a good coating of sugar; cause it to adhere to the egg and pie crust; trundle over it a clean brush dipped in water, till the sugar is all moistened. Bake again for about ten minutes.

Johnnycake.—Beat one egg, add one cup of sour milk, one cup of sweet milk, one teaspoonful of soda, from one to three tablespoonfuls of molasses, salt, and stir quite soft.

To Purify Dairy Utensils.

Stand on end, in a convenient place for use, an open-ended vessel of suitable dimensions for the size of the dairy, say from half a barrel to a hogshead. In this slake some good quicklime, enough to make a thin whitewash when filled full of water, and cover to keep out the dust and dirt. The lime will settle, leaving a saturated solution of lime over it, as clear as spring water.

After using the milk pans, etc., wash them as other utensils are washed and rinsed, then dip them in the adjoining cask of clear water, giving them a quick turn, so that every part becomes immersed therein; set them to drain and dry, and the purification is complete without any scalding process, from the new pan to the old worn-out one.

The lime in the clear water instantly neutralizes the acidity of the milk yet remaining in the cracks or seams, etc., of the milk vessels, to destroy which the process of scalding has been performed. In the case of a very small dairy, or one cow, the clear water may, if preferred, be dipped out for the time being and poured gently back again, the lime purifying the water and keeping it good all summer.

Selected Receipts.

To Preserve Strawberries.—To two pounds of fine, large strawberries, add two pounds of powdered sugar, and put them in a preserving kettle, over a slow fire, till the sugar is melted; then boil them for half an hour as fast as possible; have ready a number of small jars, and put the fruit in boiling hot. Cover the jars immediately, and keep them through the summer in a cold, dry cellar. The jars must be heated before the hot fruit is poured in, otherwise they will break.

To Pack Away Dresses.—Carefully fold in very dark blue paper, as highly glazed as possible. This will preserve the color of them, but they must also be kept in a dry place, or be occasionally unfolded and hung for a few hours in a dry room, and the paper be dried, too, otherwise they are sure to get spotted with mould.

Cut Flowers.—The first thing to be considered in arranging cut flowers is the vase. If it is scarlet, blue or many-colored, it must necessarily conflict with some hue in your bouquet. Choose rather pure white, green or transparent glass, which allows the delicate stems to be seen. Brown Swiss-wood, silver, bronze or yellow straw conflict with nothing. The vase must be subordinate to what it holds. A bowl for roses. Tall-spreading vases for gladiolus, fern, white lilies, and the like. Cups for violets and tiny wood flowers. Baskets for vines and gay garden blossoms. A flower-lover will in time collect shapes and sizes to suit each group. Colors should be blended together with neutral tints, of which there are an abundance—whites, grays, purples, tender greens—and which harmonize the pink, crimsons, and brilliant red into soft unison. The water should be warm for a winter vase—cool, but not iced, for a summer one. A little salt or a bit of charcoal should be added in hot weather, to obviate vegetable decay, and the vase filled anew each morning. With these precautions your flowers, if set beside an open window at night, will keep their freshness for many hours even in July, and reward by their beautiful presence the kind hand which arranged and tended them.

Arsenic in Colored Carpetings.—Hallwachs has found that not only green but also the red-colored carpetings frequently contain arsenic. He particularly asserts that the brilliant dark red colors now so greatly in demand, contains enormous quantities of this poisonous substance. The goods burned with the blue flame of arsenic, and gave its characteristic garlic odor. Enough of the color could be rubbed off with the finger to give a distinct precipitate of arsenic with the usual reagent, and in solution in hydrochloric acid covered some copper pieces with the greyish coating characteristic of the substance.

Potatoes, which are a dearer food than meat for the supply of flesh, are far cheaper as a source of heat to the body, so with this view we associate them in our meals. Cheese gives us cheap flesh but dear fuel, so we take it with bread, which supplies the latter economically. The making of palatable mixtures of various kinds of food forms the art of cookery. It is a maxim as old as Hippocrates, that "whatever pleases the palate nourishes," and it is only when taste becomes depraved by indulgence that the pleasure of eating becomes contemptible.

A western paper gives the following recipe for keeping potatoes, and asserts that it will preserve them for years: Dust over the floor of the bin with lime; put in about six or seven inches deep of potatoes, and dust with lime as before. Put in six or seven inches of potatoes, and lime again, and repeat the operation till all are stowed away. One bushel of lime will do for forty bushels of potatoes, though more will not hurt them, the lime rather improving the flavor than otherwise. The lime may be used for fertilizing after this use of it.

Bed Bugs.—Take as much common salt as a quart of cold water will dissolve, and wash the bedstead thoroughly. After a few trials there will be no occasion to repeat the process.

Machinery for the Condor Mine.

The mill machinery of the Condor mine, (discovered by Mr. J. D. Boyd, in the Ely Mining District, Lincoln county,) is worthy of the inspection of those skilled in such matters, on account of its superior character. The engine, boiler and roller pans are at the Pacific Iron Works, and will be shipped in a few days. The cylinder of the engine is 14 inches in diameter, and 30-inch stroke. The crushing of the ore as it comes from the mine is to be done by one of the large size Brodie crushers, made at the Fulton Foundry, which reduces it to an average size of one-half inch at the rate of forty tons per day with five-horse power. The distinctive principle of this crusher consists in giving two motions to the working jaw instead of one, as in the crushers of ordinary construction, thereby doing more work and better preparing of the stuff for the disintegrating action for the next step. This crusher weighs 9,000 pounds, and is made in pieces, as is the engine, for ease of handling, being put together with keys. From the Brodie crusher the ore passes without handling to a pair of rolls twenty-seven inches in diameter, and weighing 8,000 pounds, made at the Pacific Foundry, and is further reduced to variable sizes from very fine stuff to three-sixtenths of an inch, at the rate of forty tons per day at an expense of five-horse power.

The pulverizing and amalgamation of the ore will be done in six of the new improved Hepburn roller pans (made at the Occidental Foundry), each weighing 5,300 pounds complete, requiring four-horse power to drive them, and reducing from 6 to 8 tons of ore per day. These pans, as shown by the experience of mills now running, operate with less power, lose less quicksilver, and take the ore much coarser than any of the ordinary flat-bottom pans, thus avoiding the necessity of batteries and stamps, and the heavy expense of the latter in erection and operation.

The settling of the quicksilver is accomplished by six eight-foot settlers, of slightly convex bottom and four feet in depth. These have been found to be very efficient in practice; they each weigh 4,400 pounds, and are made at the same foundry as the pans. This mill has a capacity of from thirty-five to forty tons per day, according to the nature of the ore to be reduced.—*Alta*.

THE TANITE COMPANY,

STROUDSBURG, PA.,

Sole Manufacturers of

THE TANITE EMERY WHEEL,

And builders of Emery Grinders, Saw Gummers, Etc., Etc.

Emery Grinding Machines,

At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.

SOLID EMERY WHEELS,

From 40 cents to $113 each.

Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cutters. For illustrated circulars address The Tanite Co., Stroudsburg, Monroe county, Pa.

SAN FRANCISCO NEWS LETTER

AND CALIFORNIA ADVERTISER.

Devoted to the Leading Interests of California and the Pacific Coast.

The News Letter is the most reliable organ representing the moneyed and substantial interests of the City and State; its Banking, Real Estate, Commerce, Insurance, Mining and other Stocks. It reflects the times as they pass; men, manners, literature, theatricals and follies. It is piquant and pungent by turns—wise, witty, grave, gay, lively and severe; the mentor, whip and mirror of the town. Sold by all Booksellers and News Agents throughout the world.

Office—633 Montgomery street, opposite Montgomery Block. Also, Offices of the "China Mail," "Mail Bag," "City Index and Purchaser's Guide," etc. 18v24-tf

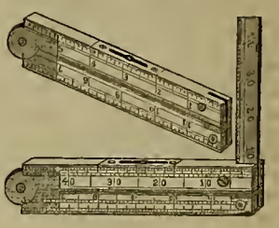
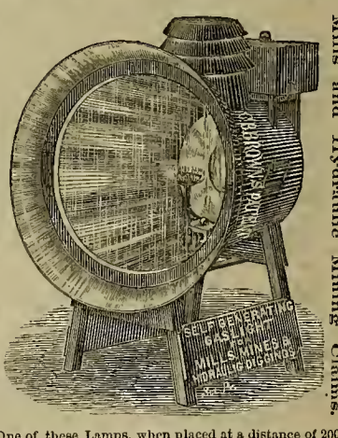
STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long, when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address
STEPHENS & CO.,
18v24-3m Rivertou, Conn.

BROWN'S PATENT LAMP.
BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.
For further particulars address
C. B. BROWN,
7v24-t Placerville, Cal.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending May 14th, 1872.

Trade-Mark—Teas.—Castle Brothers, San Francisco, Cal.

Gasket-Packing.—George W. Coffee, San Francisco, Cal.; assiguor to himself and John W. Tucker, same place.

Apparatus for Ageing Wines and Liquors.—Adolphe Luquet and Prosper Huerne, San Francisco, Cal.

Bee Hive.—Peter Ole Petersen, Oakland, Cal.

Ore-Washer.—William T. Rickard, Monitor, Cal.

Magnetic Indicator for Teaching, Etc.—Jacob Unna, San Francisco, Cal.; assignor to A. Roman & Co., same place.

Candlestick.—Joseph Williams, Sau Mateo, Cal.

Lubricator.—William T. Garratt, San Francisco, Cal.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreigh Patent Agency, the following are worthy of mention:

Passenger Fare Box.—Carlton Newman, San Francisco, Cal., assignor to himself and Geo. P. Kimball and R. L. Ogden. This is an improvement in boxes for collecting fares on street cars and other vehicles carrying passengers. It consists firstly, in a novel arrangement of the first or receiving chamber, into which the money or fare is deposited for iuspection; Secondly, in an improved arrangement of the lamp and reflector, so as to give the best possible light; Thirdly, in the employment of a perforated metal front for the upper chamber through which the fare can be inserted if desired. This front is arranged so that it may be lifted vertically in the frame of the box by a lever or other suitable device, so as to drop the fare into the next compartment; and lastly in the employment of an intermediate chamber of a novel and useful construction, into which the fare passes from the inspectiou chamber before entering the drawer or lower compartment.

This is an ingeniously constructed box which is burglar-proof, and for simplicity and couvemience excels anything of the kind heretofore nsed in the Eastern States. It is now in use on some of the Howard street cars, in this city, as well as on the Oakland and Fruit Vale, San Jose and other lines, where it is said to give good satisfaction.

Improvement in Waterproofing or Preserving Fabrics.—Sidney P. Cook, San Francisco, Cal. This invention relates to an improved process or composition for treating fabrics for the purpose of rendering them water-tight and proof against the effects of dampness, while it also preserves the fibre and qualities of the goods. It is more particularly applicable for treating canvas or other closely woven fabrics which are intended for the manufacture of hydraulic hose, such as are employed in connection with steam and other fire engines and like purposes. When used for this purpose it not only closes np the pores and interstices of the fabric with an indissiluble substance, but renders the employment of rubber coating for the hose of no particular use, shields the fabric from injury and makes it tough and unyielding.

Stamp and Hammering Machine.—Geo. D. Crocker, Virginia City, Nevada. This invention is classed among stamping and hammering machines, euch as are used for hammering metal, drugs, rock and other materials or substances, either for the purpose of forging or crushing them. The machine is a combination of the ordinary stamp and stem, such as are ueed in quartz mills for crushiug ores, with a lever arm for operating them in the manner of operating an ordinary tilt or trip-hammer. The improvement consists in an attachment or joint for connecting the lever arm with the stamp-stem, by which sufficient freedom of motion is permitted to accommodate the movements of both, while the blow of the hammer or stamp will not affect it.

Machine for Clarifying, Mixing and Bleaching Lard.—Oscar J. Backus, San Francisco, Cal This invention is a machine for treating lard, iu order to improve its commercial value by clarifying, bleaching and mixing it in one process, so as to render it perfectly white and pure and homogenous throughout the whole mass. It consists of oppositely inclined plane surfaces combined in one machine, and arranged one above the other. At the lower side of each inclined surface is placed a strainer, or perforated channel, which receives the lard and delivers it upon the next lower inclined surface in a finely divided state, so that the air can act upon every particle and bleach it.

The Text of Interesting Decisions in Patent Cases.

Date of Invention—Priority of Invention—Reduction to Practice—Prior Publication.

A patentee whose patent is assailed upon the ground of want of novelty, may show by sketches and drawings the date of his inceptive invention; and if he has exercised reasonable diligence in "perfecting and adapting" it and in applying for his patent, its protection will be carried back to such date.

In a race of diligence between rival inventors, the one who first perfects an iuvention and embodies it in a distinct form is entitled to priority.

He is entitled to priority of right to a patent who first reduces his invention to a fixed, postive form, adapted to practical use.

Reasonable diligence in "perfecting and adapting" an invention is essential to the efficacy of a claim against the patent of an independent thongh subsequent inventor.

Illustrative drawings of conceived ideas do not constitute an invention, and unless they are followed up by a seasonable observance of the requirements of the patent laws they can have no effect upon a subsequently-granted patent to another.

Where A, in 1860, illustrated his idea of an invention by a pencil sketch, which was laid aside and subsequently lost, and did nothing further with the invention for five years, while B, an independent inventor, took out a patent for the invention in 1862: *Held*, that A had not "perfected and adapted" the inventionin 1860, and that by reason of his long-continued remissness he lost any inchorate right he might have had to priority.

Where a printed publication is relied upon to defeat a patent it must be proved that it was put in circulation or offered to the public before the patentee's invention, and this must be proved independently of the imprint on the title page.

Whether an illustration by drawing, unaccompanied with verbal description as would defeat a patent, within the intent of the clause of the statute relating thereto, may well be denied on the authority of *Seymour vs. Osborne*, 11 Wall., 516.

U. S. Circuit Court, Eastern District of Pennsylvania. S. J. Reeves *vs.* the Keystone Bridge Company *et al.* In Equity, before McKennan, Circuit Judge.—Decision rendered April 1, 1872.

Bank Blasting at Dutch Flat.

Editors Press:—The result of an experimental bank-blast with giaut powder No. 2, at this place, last week, cannot, I thiuk, fail to interest you, and through you, the miners of this Coast. Bandman, Nielsen & Co., agents for this powder, fecling assured it was just the thing for pulverizing obstinate hydranlic banks, lihcrally proposed to furnish the writer with powder gratis, for a blast on any scale that, in his judgmcnt, would settle the problem of its fitness for hauk work.

Accordiugly, the "Deep Shaft claims," at this place, owned by the "Dutch Flat Water Co.," were selected for the trial. These claims have been worked with hlack powder for a numher of years, with varying results; are made np of blne and red cement-gravel, ahounding in houlders with average hight of hank about one hnndred feet. A black powder blast was already on the tapis in these claims, tunnels and chambers having been completed, and four hundred kegs of black powder brought on the ground for the purpose of charging when, by agreement, the black powder was withdrawn, and twenty-five hundred pounds of giant powder No. 2 substituted, placed in the same chambers designed for the black powder without any change in their constructiou whatever. The charge was then "tamped tight," aud exploded by a friction battery nuder the management of E. L. McClure. Fifteen turns forward and a half turn backward of the battery crank, and the Deep Shaft bank, for the distance of one hundred feet hack of the powder line, arose about fifteen feet in air, then settled back in undulating waves like the waves of the ocean, grinding and pulverizing the ohstinate mass to ashes. The adjacent hills were lined with spectators who pronounced it the most successful shot ever fired in Placer County. The entire business portion of Dutch Flat was violently shaken by the explosiou, and the scenes of women and children fleeing forth from their homes in the immediate vicinity of the blast, reminded the looker-on of families fleeing from the wrath of Vesuvius.

By actnal survey of the blasted ground, by E. C. Uren, County Surveyor, it is clearly demonstrated that the blast lifted and pulverized one hundred and seventy-two thousand cuhic yards of earth, or, in mining parlance, "knocked over two hundred feet sqnare of the Deep Shaft claims into an ash heap." Certainly, this splendid result is worthy of heing chronicled, and must possess great interest for my hrother miners at large. It also claims importance from heing the first hank hlast of No. 2 giant powder exploded on this Coast.

Allow me to publically congratulate Messrs. Bandman, Nielsen & Co., and throngh them the Giant Powder Company, on the grand resnlt of their initial shot, and to predict the rapid nse of their powder in bank hlasting throughout the mines. Let me add that the placing of the powder and tampiug of drifts and chambers were under the supervision of O. W. White, traveling agent of the Giant Powder Co., to whose skillful and indefatigable personal exertions much of the credit of snccess is due. H. C. Kelsey.

Dutch Flat, May 30, 1872.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

Phelps Cons. G. & S. M. Co.—May 23. Location: Devil's Gate Dist., Lyon County, Nev. Capital stock, $3,500,000, in 35,000 shares. Trustees—J. L. Schmidt, L. R. Goodman, Theodore Phelps, J. P. Jones, Wm. McLaughlin.

Lander Cons. M. Co.—May 24. Location. Lander County, Nev. Capital stock, $5,000,000, in 50,000 shares. Trustees—C. B. Land, D. J. Staples, C. H. Bumrell, Paul Moroney, S. B. Boswell and Richard Chenery.

Lany Eastern Tunnel & M. Co.—May 24: Location: Salt Lake county, Utah Territory. Capital stock, $1,000,000, in 40,000 shares. Trustees—Charles J. Collins, Henry C. Kibbe, Nelson A. Handy, W. S. Wayman, George Emery, John Esten and Charles S. Healy.

Brandon M. Co.—May 25. Location: El Dorado county. Capital stock, $1,200,000, in 24,000 shares. Trustees—John F. Pope, A. D. Carpenter, A. Peck, Z. B. Brandon and Isaac Tabor.

Southern Goln Hill M. Co.—Filed an amended certicate May 25. Location, Storey Co., Nevada. Capital stock, $2,400,000 in 24-000 shares. Trustees—Robt. Harrison, James Anderson and B. B. Minor.

South Justice M. Co.—May 27. Location: Gold Hill M. District, Storey couuty, Nevada. Capital stock, $2,500,000, in 25,000 shares. Trustees—George D. Roberts, S. W. Lee, H. H. Flagg, A. E. Head and Henry Baker.

Kearsarge M. and M. Co.—May 27. Location: Inyo county. Capital stock, $2,500,000, iu $50,000 ebares. Trustees—Edward Martin, Jos. Frank, C. H. Von Gorder, M. Rosenbaum and Peter Donahue.

Table Mountain Blue Gravel Co.—May 27. Location: State of California. Capital stock, $3,000,000, in 30,000 shares. Trustees—J. W. Roberts, J. W. Gashwiler, W. B. Bourne, B. Marks and Joel F. Lightner.

La Paz Tunnel S. M. Co.—May 29. Location: Ely District, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—McHiller, Chas. Hosmer, Henry Baker and J. B. Richmond.

Segregaten Calenonia M. Co.—May 29. Location: Storey county Nevada. Capital stock, $1,000,000, in 10,000 sharcs. Trustees—Lafayette Maynard, John H. Baird, Alex. Forbes, Wm. H. Bremer aud Thomas Stewart.

Lewiston G. and S. M. Co.—May 29. Location: Devil's Gate M. District, Lyon county, Nevada. Capital stock, $2,500,000, iu 25,000 shares. Trustees—J. P. Jones, J. L. Schmitt, L. K. Goodman, Theo. Phelps and Wm. McLaughlin.

Pacific Tunnel M. Co.—May 29. Location: Ely M. District, Nevada. Capital stock, $3,-000,000, in 30,000 shares. Trustees—Charles A. Washburn, J. Babcock, W. S. Whitney, C. P. Hall and S. A. Raymond.

Meetings and Elections.

The Bowers M. Co. have elected the following Trustees: Chas. Jones (Presidcnt), Richard Ivers, C. B. Land, A. Finchaker and L. B. Franke. W. H. Watsou was elected Secretary.

The Louisa M. Co. have elected as Trustees, J. A. Pritchard (President), Watson Wobb, A. D. Hatch, H. Baker and S. A. Raymond. W. H. Watson was elected Secretary.

The Silver Hill, M. Co. have elected as Trustees, A. K. P. Harmon, Jas. C. Flood, C. B. Land, Joseph Holland and W. S. Hobart. W. E. Dean was elected Secretary.

The Belcher M. Co. met on the 24th instant for the purpose of taking into consideratiou a proposition to increase the capital stock. There were 10,280 shares represented, the total number being 10,400. It was found that there was an error in the advertisement calliug the meeting, by naming Monday, May 24, instead of Friday, May 24. The date was right but the day of the week was, of course, wrong. To obviate any legal complications which might arise, it was resolved to readvertise the meetiug for June 25, when action will be taken on the question.

The Trusteee elected at the annual meeting of the North San Francisco Homestead and Railroad Association were Hugh Whittell, F. S. Spring, James T. Boyd, N. B. Stone and J. G. Klumpe.

The Daney M. Co. have elected Geo. R. Spinney, Secretary, and the office has been removed to 320 California street.

Yield of Comstock Mines.

The Virginia *Enterprise* gives the following quarterly statement, showing the yield of the mines along the Comstock for the qnarter ending March 31. It shows quite a small number of mines worthy of mention as paying institutions:

ABSTRACT STATEMENT FROM THE QUARTERLY ASSESSMENT ROLL OF THE PROCEEDS OF THE MINES OF STOREY COUNTY FOR THE QUARTER ENDING MARCH 31, 1872.

Name of Owners.	No. of Tons Extracted.	Value per Ton.	Gross Yield in Value.	Actual Cost of Extracting.	Actual Cost of Reduction or Sale.	Total Cost.	Amount Deducted as Product by Law.	Net Yield or Value on which Tax is Levied.	Total Amount of Tax.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alleghany Consolidated Gold Mining Company—Location of works, Alleghany, Sierra County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of April, 1872, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, 31 New Merchants' Exchange, California street. Any stock on which said assessment shall remain unpaid on the third day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 24th day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BEFFINGTON, Secretary.

Office, No. 37 (third floor), New Merchants' Exchange, California street, San Francisco) ma4-1t

Eagle Quicksilver Mining Company---Location of works, Santa Barbara County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 8th day of May, 1872, an assessment of $40 per share was levied upon the mines of said company, payable immediately in gold coin of the United States, to the Secretary at his office, room 5, No. 302 Montgomery street, San Francisco, California.

Any shares upon which said assessment shall remain unpaid, on Thursday, July 11th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, July 13th, 1872, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 15th day of July, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. J. WATSON, Secretary.

Office—Room 5, No. 302 Montgomery street, San Francisco California. ma11.

Lyons & Wheeler Mining Company—Location of works, Mayaard Mining District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of May, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States coin, to the Secretary, at the office of the company, Room 3, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday, the 24th day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 15th day of July, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Office, Room 3, No. 419 California street, San Francisco, California my25-td

Mina Rica Mining Company—Location of works, Auburn District, Placer county, State of California.

Notice is hereby given, that at a meeting of the Trustees of said company, held on the 8th day of May, 1872, an assessment of 20 cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin to the Secretary of the company, at the office of the company, No. 320 California street, room No. 5, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Monday, the 10th day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday the first day of July, 1872, to pay the delinquent assessment, together with cost of advertising and expenses of the sale. GEO. R. SPINNEY, Secretary.

ma11-4t No. 320 California St., San Francisco, Cal.

Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 16th day of April, 1872, the several amounts set opposite the names of the respective shareholders as follows:

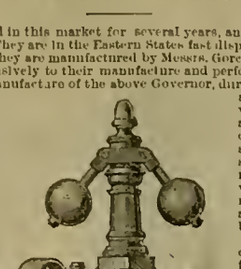
F.. Any stock upon which said assessment shall remain unpaid on the first day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 22d day of June, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, Room No. 1, second floor, No. 318 California street, San Francisco, Cal.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorehur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Churr, Albany, Oregon, and many others.

We adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of Steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emsnuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Churr, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. ***THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞ At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

MILL STONES.

Portable Mills, Eureka Smut Machines, Bran Dusters, Dufour & Co.'s Celebrated Dutch Anchor Bolting Cloths, and General Mill Furnishing.

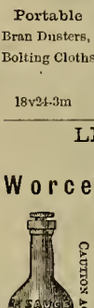
TRAVIS & WAGNER,

18v24-3m 41 First street, San Francisco.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.



Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershiro Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper

Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-eow-tf

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

PURCHASERS please say advertised in SCIENTIFIC PRESS.

San Francisco Tunnel and Mining Company.—Location of Works, Little Cottonwood Mining District, Utah Territory.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 13th day of April, 1872, the several amounts set opposite the names of the respective shareholders as follows:

Names	No. Certificate.	No. Shares.	Amount.
Brommer Diederick	48	3000	$750 00
Moroney, Paul	5	3000	750 00
Retieker, Chas.	8	3000	750 00
Seaman, LaFayette	7	3000	750 00
Selby, T. H.	4	3000	750 00

And in accordance with law and a supplementary order of the Board of Trustees, made on the 30th day of April, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of said company, on the 10th day of June, 1872, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Secretery.

Office, 418 California street, San Francisco.

Stockholders Notice---Office of the Tecumseh Gold, Silver and Copper Mining Company. San Francisco, May 6th, 1872.

In accordance with a Resolution adopted at a meeting of the Trustees of the Tecumseh Gold, Silver and Copper Mining Company, held this day, a special meeting of the stockholders of said Company is hereby called, the same to be held at E. Magrisch's Hall, S. W. cor. of Kearny and Clay Sts., opposi o the Plaza, San Francisco, Cal., on Wednesday, the 12th day of June A. D. 1872, at 2 o'clock P. M., to take into consideration and decide upon the proposition to increase the capital stock of said Company from one hundred fifty-three thousand and five hundred dollars, divided into six hundred and fourteen shares of two hundred fifty dollars each, the present capital of the Company, to three millions of dollars, to be divided into thirty thousand shares of one hundred dollars each.

J. TH. HELMKEN,
J. F.G. EGGERS,
JACOB HAHN,
F. SCHUMACHER. } Trustees.

Stockholders Meeting.—Office of the Silver Sprout Mining Company, No. 318 California street, San Francisco. May 23, 1872.

NOTICE is hereby given that the annual meeting of the stockholders in the above named company will be held at their office, No. 318 California street, (Room No. 1, second floor,) San Francisco, on Tuesday, the 25th day of June, 1872, at the hour of 1 o'clock P. M.

my25-4t T. B. WINGARD, Secretary.

Union Gold Mining Company.---Location of works, Howland Flat, Sierra county, State of California.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment (No. 5) levied on the 11th day of April, 1872, the several amounts set opposite the names of the respective shareholders, as follows:

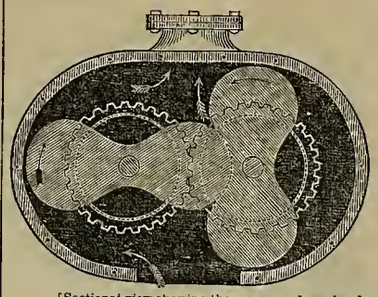
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

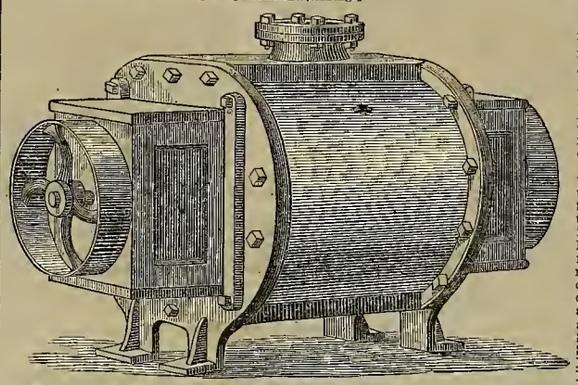
Stockton, Cal.



[Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

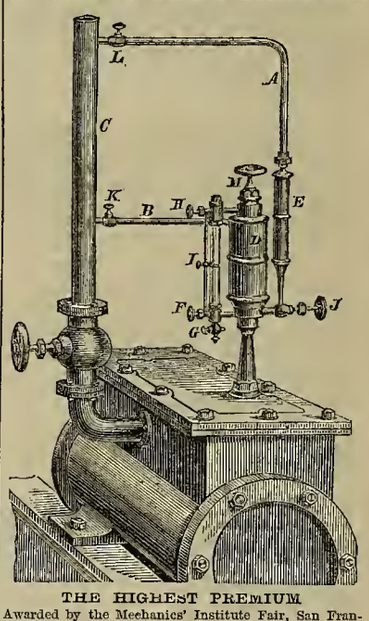
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it t en hecomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rod- and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.
Office, 315 California street. A. J. SEVERANCE,
CHAS. H. RANDALL.
22-v23-tf J. GUS. BURT.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

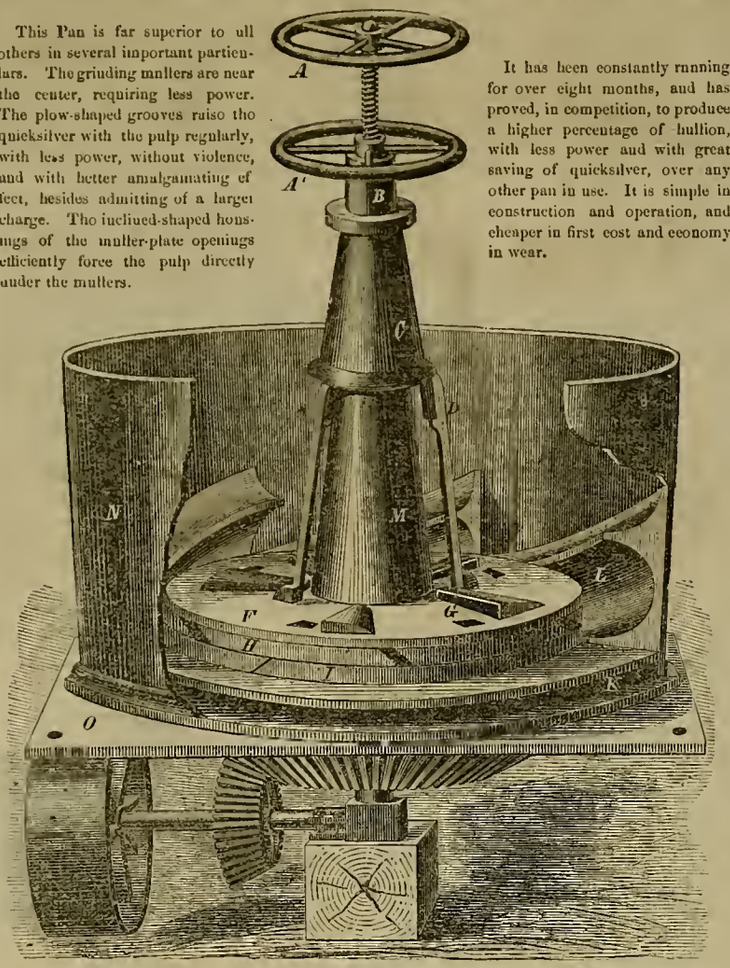
STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in constant operation. 15v20-1mr,1antf

A Blake's Crusher
FOR SALE CHEAP.

One of Blake's Pstent Ore Crushers, size 8x10, second-hand and in perfect order, is offered for sals cheap. Also,

A STEAM ENGINE,
8x16, snd another 6x12, second-hand and in good order. Also,

A New Mining Pump,
6-inch bore and 5-feet stroke, double acting.

All of the above will be sold at good bargains by

J. HENDY,
2Iv24tf No. 32 Frcmont street, San Francisco.

THE GIANT POWDER COMPANY

Ars now msnufscturing besides the famons regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somswhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUOH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3ml6p General Agents, No. 210 Front Street.

A NEW BOOK.
The Explorers', Miners' and Metallurgists' Companion.
Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

ontaining 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francieco, a Practical Operator for Thirty-four Years; Explorer, and Reeident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin or its cquivalent). In leather, $12. Postage, 60 cents extra. Address all orders (wholesals or retail) to

DEWEY & CO.,
Scientific Press, 338 Montgomery street, San Francisco.

Opinions of the Press.

Practical Mining Literature.—The want of sonnd scientific knowledge has been much felt by the miners employed in devsloping the vsst mineral resources of the western regions of the United States, and for this wsnt the work of Mr. J. S. Phillips, M. E., of San Francisco, will provs an excellent remedy. The book is written expressly for the miners in the districts mentioned. * * * Metallurgy, which is treated of in the concluding section, is dealt with in the same practical manner as the other subjects, the book altogether being ons exactly calculated to suit the views and meet the requirements of those for whom it has been written. It is not intended as a scientific work, but to facilitate prsctical operations upon scientific principles. This object the book is well calculated to obtain, and its value is much enhanced by the principle which Mr. Phillips hss adopted of including only those processes which can easily be carried out by practical men unused to the delicate manipulations necessary in the laboratory of the practis d chemist. The work will undoubtedly obtain a large number of readers.

Mr. J. S. Phillips is well known to the readers of the Mining Journal as having also had considerable experience in mining in Cornwall.—[London Mining Journal.

The most practical and comprehensive work on mining subjects extant.—[Scientific Prsss.

A Valuable Work.— * * Ws know of no work on these subjects in the English language at oocs so comprehensive, practical and intelligibls.—[S.F. Golden Era.

Besides so many new facts and the large amount of useful knowledge derived through these official sources (Geological Surveys), the mining public sre likely to find in the recently published work of J. S. Phillips, a valuable teacher and assistant. This book, which treats in an intelligent and practical wsy on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific Coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—[S.F. Commercial Herald.

* * Besides that, there is much actual knowledge to be gained from a perusal of this volume, and in this respect alone it will be a valuable assistant to those engaged actively in mining.[—S. F. Chronicle.

* * It is a plain, but comprehensive digest of mining matters generslly. It affords a vast quantity of information as to the appearance and valus of different ores.—[S. F. News Letter.

HINTS FOR INVENTORS.
We will send on receipt of stamp for postage, FREE, our 52-page Circular, containing 112 Illustrated Mechanical Movements; a digeet of PATENT LAWS; information how to obtain patents, and about the rights and privilegea of inventors and patenteee; list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

REMINGTON'S
BREECH-LOADING
Sporting, Hunting, and Target Rifles.

Same systsm as the "Remington" Celebratsd Military Rifle, of which over half a million have been sold. Its simplicity unsurpassed. For strength and durability unequalled. In accuracy unrivalled. In range, penetration, and ease of manipulation, without comparison.

The "Sportsman's" Delight, the "Hunter's" Favorite, the "Target-Shooter's" Pride. Also

REVOLVERS FOR HOUSE USE.

In these days of thieves and Burglaries, every householder should have a revolver for home protection.

REMINGTON'S RIFLE CANE.

Every gentleman should have one for protection against dogs and rowdies, and for field use.

VOLUME XXIV. Number 23.

"Hydraulic Joints."

[Written for the PRESS by H. WRIGHT PHILLIPS.]

Extensive as the present application of hydraulic power is, there is no reason why it should not be much more so if two causes of retardation were removed. The first of these is, that the extreme adaptability of hydraulic pressure to many operations requiring but little power, is as yet not understood. For instance, in very many cases a steady and perfectly smooth motion, such as can be regulated to any speed, and also so arranged that the power cannot rise above a certain point, would be invaluable for small manufacturing purposes. Now if, as is generally the case, a screw, cam, or other ordinary mechanical means be used, the graduation of speed, though simple enough in its first design, offers a difficulty in general when the machine is in motion. Further, should any obstruction occur, the power at once begins to accumulate, till in many cases the force becomes so great as to cause the destruction of some parts of the running gear.

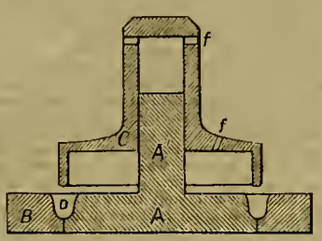
The practically perfect non-elasticity of water gives just the advantages required, a motion of complete uniformity can be obtained, which, without stopping the machinery, can be regulated to any desired extent from nothing to the most rapid velocity originally estimated in the designing of the machine. Should the resistance be increased by any obstruction, the machine will simply stop, instead of destroying any part of itself, or the attachments, supposing always that ordinary care and knowledge are exercised in proportioning the work, pressure, and size of the machine to its attachments and the ultimate power to the ultimate resistance.

But it may be objected that hydraulic power is only applicable where very great resistance has to be dealt with, and that it is not at all applicable where very small degrees of power are required. Again it may be said that there is so much trouble with the joints as to render other appliances preferable. With the question of hydraulic joints—why they are so much trouble, how they ought to be made, and what amount of indurance may be expected from them, when properly constructed, I propose to deal in a simple and practical manner, leaving the other question open for a future communication.

To all intents and purposes the joints, more particularly the working ones, are the vitals in arrangement of hydraulic mechanism. No matter how perfect other parts of the machine may be, if the joints are defective continued annoyance will assuredly ensue. How to make a thoroughly effective hydraulic joint is a secret possessed by but few. No matter how well the leathers are made, or of what quality of material; no matter how carefully they may be inserted or how correctly the recesses for them may be constructed, if they are called upon to encounter ought but a highly polished surface, against which to work, they cannot last long.

It must be borne in mind that if an unpolished surface is conducive, in the case of a metallic packing moving in contact with it, to rapid wear, it is, in the case of leather, nothing short of positive destruction. To leather, under high pressure, the very pores of the metal become so many pits, into which the leather is forced, only to be torn away in small fragments. It might seem small and unnecessary to urge this truth, were it not that I have

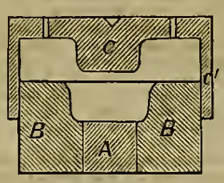
Fig. I.



known but too many cases where most costly results have followed from the use of unpolished surfaces.

Over and beyond these causes there is still another, which is, we ought almost to say, universal, so seldom is care taken to avoid it, or rather, in fact, so deliberately

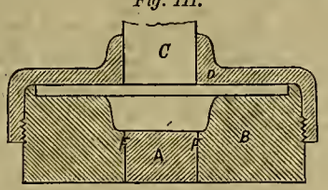
Fig. II.



is it, as it were, cultivated. I refer to the rapid destruction of leathers, by reason of the destructive mode of adjustment, formed only with a view of first cost, in such a way as to positively insure the actual cutting of the leather.

In making hydraulic joints three types of leather are used, which are usually designated as cup, cap and hat leathers,

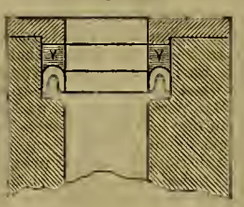
Fig. III.



respectively. The cup leather is the most commonly used, and is of a form so well known as not to need any description here. The cap leather is not unlike a bat deprived of its rim and with a hole in its crown; and the hat leather resembles a hat minus all the crown. Of course in each case the grain of the leather, that is the outer side, must form the working surface of the hydraulic packing. It will then work to a smooth, evenly polished surface, if proper care be taken in finishing the metal in contact with it. French chalk mixed with a little of the best unsalted tallow, forms an excellent lubricating paste for the leathers.

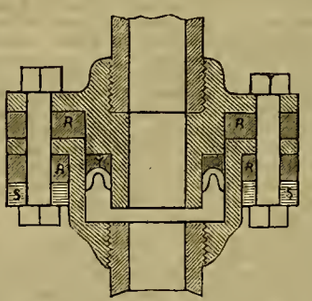
In preparing hydraulic leathers of various kinds, the following mode of procedure will be found completely successful: The leather selected must be of the best tannage, *i. e.*, oak bark tanned leather. The suitable parts of the leather are the hard parts of the butt, for large leathers, and the best shoulders for the small ones. On no account should any of the belly leather be used. With a sharp knife the whole of the fleshing or soft inner portions

Fig. IV.



must be completely removed; great care being taken to cut the leather to an even surface. The slightest cut below the surface will spoil the part so cut, as the leather when at work will then fail, and that soon. Having so prepared the inner surface of the leather, the outer grain must be turned uppermost, and very carefully examined for any cuts or flaws, no matter

Fig. V.



how minute; with a pair of dividers the circles describing washers of the sizes suited to produce the required leathers must next be drawn. For cup and hat leathers an inner circle will be requisite to mark the place to be cut out at the centre.

When cut leathers are required with any holes in the crown, the leg of the dividers must not puncture the leather; use a loose piece of leather to take a center from, or a circular tin plate and "scribe" round it. After cutting the washers, overhaul them and see whether the thickness is exactly equal all over each. If it be not so, then the leathers will be drawn unequally in the die. The best way to make the washers is to cut them square; fasten by the corner to wood, faced true in a lathe, and then turn them, first to a proper even thickness; secondly, cutting them to the right circular size. Of course the grain side must go towards the face plate and the fastenings only pierce the waste corners.

After the washers are thus prepared, they are to be steeped in soft water till soft and flexible. When they are thoroughly softened they are ready for the dies, which I will describe:—First, a really good pair of dies ought to be made for making cup leather. The best material for dies is good hard gun metal, as cast iron is affected by the tannic acid, and so becomes troublesome, so that the dies move in and out of each other with considerable friction. Besides the iron is apt to tear the leather, since it becomes, as it were adhesive or grating on the surface, and the leather does not slide easily with the recess of the dies.

The sketch herewith shows in fig. 1 a pair of dies of the latest and most improved design for making cut leathers. The figure also includes the proper means of forcing home the die when the leather is adjusted. *A* is the center piece of the die, having a projecting spindle, *A'*, which acts as a guide to center the leather; the moulding ring, *B*, is the outer die, fitting accurately around *A*; the recess, *D*, is formed half in each die. When this construction is not observed there is difficulty in removing the leathers, and they are frequently injured. When very large numbers of leathers have to be made it is worth while to provide special means for removal from the dies. The best means to accomplish this consists of two rings of metal, a little deeper than the dies. One ring should just pass freely around the die, *A*, the other through the die, *B*, the edges of these dies must be smooth and rounded, the rings merely resting on the form. When the dies are separated, the leather is very quickly removed from either dies by means of these rings. Should the leather, as is the usual case, be upon the die, *A*, this die is merely dropped into the ring belonging to it. If the die, *B*, should carry the leather it is forced over the proper ring. If these rings are not provided, some blunt instrument must be used.

The bell, *C*, fitting upon the guide, *A*, is in every way superior to the ring generally used for forcing the leather into the dies. The small holes at *f f*, are outlets for the air. This arrangement for forcing home the dies is the same as in any hand punch, and needs no description. The best arrangement for forcing home the bell is by hydraulic power itself. When a press is at hand the leathers are best prepared by placing the dies between the pattern, and then allowing merely a slight opening of the valve to produce just leakage into the cylinder, by means of which a slow motion is produced.

After being forced home, the leather must be allowed thoroughly to set, when it becomes firm, the pressure may be removed and the bell withdrawn; next with a sharp knife pare off the leather level. If you have no lathe, finish the leather in the dies and carefully trim them. It you have

[Continued on page 357].

CORRESPONDENCE.

Geology and Mining.

EDS. PRESS:—Geology is generally understood as a science; but, in reality, under that name may be included a whole group of sciences, and the one to which my experience permits me to refer is mineral veins or deposits from which are derived all the metals of commerce. There are very many metals rarely met with, being found only in small quautities and at remote intervals; others, the most essentisl, are almost universally deposited in such an abundance and under so slight a covering as to bring them readily within reach of the miner's art, and to them we owe our present high state of perfection in the useful arts; and to their extended application the world may safely attribute the progress and wealth of civilized nations. There is no class of men which has such an advantage for a thorough knowledge of mineral veins or deposits as the miner; yet, on account of his being daily conversant with the ever-varying phenomena of the crust of the globe, he is negligent on many valuable points, which he thinks are not worthy of notice because he sees them every day. If a thorough geologist or mineralogist was conversant with facts which are often familiar to the mind of an intelligent miner, they would write volumes concerning them. In order to acquire such knowledge, one must be guided by an extended experience, and must exercise a sound and disciplined judgment, which is requisite at every stage of development, and which should be marked by assiduous and systematic observations.

Under studious and careful observation man is surprised to find Nature so plain and similiar all over the face of the globe. As an example of which allow me to cite the discovery of the "gold fields" of Australia, which might have long remained hidden but for the research of the late Sir Roderic Murchison, in the Ural mountains. From his investigation with regard to that locality he was led by inductive reasoning to believe that gold would be found iu similar rock, specimens of which had been sent him from Anstralia. Research fully verified his prediction.

In the States of Carolina, Georgia and California; in Australia, Russia, New Zealand and even Wales, in Great Brittain, the auriferous rocks bear a close similitude to each other.

Gold is no longer confined to one country as was thought of yore, bnt is widely diffused, and in various conditions, traces are continually found in iron pyrites of the more ancient rocks, also associated with many different minerals. I have seen in Utah and elsewhere iron pyrites rich with gold. This we should not have known had we not called to our aid the chemist. Thus by calling other branches of science to our sssistance we can bring forth positive conclusions instead of vague suppositions as in time past.

We all know that trees from the tropics will not grow in the frigid zone; so also we know by experience that minerals must have their own peculiar characteristics.

T. S.

San Diego Mines.

EDITORS PRESS:—That the importance of the San Diego mines is, and has been uuderated, is a present conviction of your correspondent, especially after a personal inspection of the principal workings. There are no further developmeuts in the

Stonewall

Than when visited before, (some sixteen months since) they having sufficient ore to stope out above the fifty foot level to keep the mill in operation for some time; but as soon as they get their new engine and pump in operation, sinking can be resumed. Their vein matter is all decomposed, so that they must work the whole, (sixteen fect iu width). At the bottom of the shaft the solid quartz was struck, so that when the lower level is opened the rock can be sorted if the whole does not pay.

The Owens

Is no doubt a good mine, and is now being opened systematically, the lower level being driven at two hundred feet in depth. If all the mines in the district were as well managed as the Owens, "times" would be different.

The California, an extension of the Owens, will resume work in a few day; the do-nothing and pay-nothing portiou of the company heing ousted. In the

Banner District

Everything appears lovely. Gunn has bought into the Antelope, and will no doubt bring order out of confusion, which has heretofore predominated in this company. For the depth obtained this has payed the hest of any mine in the vicinity. The Madden, on the same vein, is being steadily worked. "Little Mack," your occasional correspondent, is driving the drill vigoronsly in this mine, and we hope he will be successful, as he deserves. The

Baily Brothers

Have done a great amount of work on their mine, having opened it for a thousand feet along the lode, finding pay ore all that distance. This is the most conveniently sitnated mine for economical working in either district. A tunnel along the ledge from the foot of the mountain, run to the distance of 500 feet, wonld have 400 feet of pay ore overhead to stope out. Their water power—sixty feet fall—is sufficient to ruu a ten stamp mill, and ore can be delivered at the mill at seventy-five cents per ton. So that a very low grade of ore can be worked, if necessary.

The mine of the district is, however, the

Golden Chariot.

A four-foot vein of solid, all-paying qnartz. There is between two and three hundred tons of rock on the dump that will go $200 per ton; an average of twenty tons lately worked in a steam stamp mill, returned $118 per ton, saving, probably, not more than one half of the gold. There are tons of specimens iu their dump-pile, that are equal in richness to that in your office, from this mine. The mine is bonded in San Francisco for $75,000, hut why the boys wish to sell where there is more than that amount in sight, I am at a loss to know.

F. M. S.

Julian City, San Diego Co., May 14, '72.

Deep Mines.

It is a well-established fact that the value and permanency of mines depends largely on their depth. In many districts where the general formation or country rock is limestone, ore channels, or surface deposits, seem to form the rule. This district, however, is an exception. A lsrge numher of ledges have heen sunk on from 100 to 300 feet, and in no single instance has the ore "petered out;" on the contrary, all mines seem to improve in size and richness as depth is attained. This we consider a very gratifying showing in connection with the futnre prosperity of the distrtct. Unlike most mineral-bearing sections located in limestone we have here well-defined veins with walls so perfect it is almost wholly impossible to mistake them. It is not isolated cases of this kiud that we refer to, but the same rule obtains almost universally throughout the district. While it is true that some of the best defined ledges are comparatively small, it is also certain that they widen as explorations are extended deep down into the howels of the earth. The water strike, noted in yesterday's *Sentinel*, at a depth of one hundred and sixty feet, is likewise strong proof that true fissure veins exist in this section. The varied character of the ores of the district, heing from all appearances about equally divided hetween milling and smeltiug, must always give employment to an extraordinary large army of laborers in the several channels and avocations connected with successful mining on a comprehensive scale. Viewing the mining situation understandingly and impartially, we have no reason to doubt that there is a long and prosperous future in store for Eureka. No matter if we are for the present eclipsed by the overshadowiug importance of the Comstock, the time will come, and that speedily, when this district will be recognized as the backbone of Eastern Nevada. When that time arrives, as it must sooner or later, Eureka will be the most populous town between Salt Lake and San Francisco.—*Eureka (Nev.) Sentinel.*

THE Northern Pacific R. R. have given notice that they will entirely abandon all claim to title of lands in Washington Territory which any settler has the least claim to.

Coos Bay Coal Measures.

The cosl fields of the Pacific Coast have always been objects of much inquiry and interest. To them are looked for the future manufacturing schemes for the development of our local resources. Coal, iron and agriculture are materisl resources that, when found in abundance availably, will constitute the fouudation of an empire in commerce and self-snstaining population. As yet our coal interests, though much talked of and to some extent the object in points for careful enterprise, are yet undeveloped. Individual efforts have been constantly battling with the obstacles always incident upon the growth of a new country. Coal is known to exist in many different places, but means for transportation and economical systems for extracting the minersl have been generally very difficult, thereby increasiug the cost in the market, and deterring many from entering into the work of mimng.

Among the most prominent coal fields are those situated about Coos Bay, in Coos county, Oregon. Uulike the mineral extracted in some other places, the article there found is free from the impurities which generally have prevented the use of California coals for domestic purposes. It is, therefore, a matter of some importance to know that increased energy is being infused into the mines already there existing, and new enterprises are being organized for the supply of the market.

Coos Bay is situated in a heavily timbered district, about the mouth of the stream which bears the same name. Ou all sides the country rises into hills of moderate altitude, on the washed and broken sides of which coal was found many years ago to be cropping out. The quality being tested was found to be good.

In 1853 the Newport mine was located near the upper end of Coal Bank Slough. The work was commenced systematically, but for want of capital the development was slowly and safely conducted. At present the miue, which is owned by Flanigan & Mann, is confined to an area of 3,000 acres, under two-thirds of which the coal beds are known to exist. The stratification is inclined at a slight augle from a horizontal position, and is worked out through a tunnel 3,000 feet in length. A narrow gauge railroad, the first on which a locomotive was placed in Oregon, conveys the coal over the 38-inch track one mile and three-quarters to the landing, where appliances are so arranged that the work of loadiug schoouers or steamers is facilitated in the best manner. At prcsent the production is about seventy-five tons per day. This, however, varies greatly on account of the delays and difficulties in the way of obtaining schooners or steamers to load the coal for the San Francisco market.

The Eastport Coos Bay Coal Mining Company have their mine located on a tract of land containing 1,640 acres, nearer the mouth of the same slough. About two-thirds of this tract contain the coal-beds, including the out-croppings of the same that underlie the Newport tract. This mine is likewise worked by means of a tunnel. The upper portion above the main level has been worked out. Now the coal is drawn up into galleries from inclines, which necessitates the use of a steam engine. The distsnce from the wharf to the mouth of the mine is about three-quarters of a mile, over which a tramway is laid for the movement of the coal.

It has been estimated that the thickuess of the workable seams is four feet six inches, and that the loss from wastage being assumed to be twenty-five per cent., the average yield per acre of deposit is 5,000 tons of coal. The present production of this miue is said to be 2,000 tons per month.

Beside these two mines none others are yet iu active operation. Coal is fonnd to be cropping out iu various other localities distant from each other and on all sides of the Bay, which fact indicates that the entire basin contains more or less the same stratified deposit. The peculiarities of the seams are nouesbly the same in all points.

In general the deposit consists of three seams, enclosed iu sandstone, dipping toward the southwest at an angle of from five to fifteen degrees. The two priucipal and lowest seams are iu the average two feet three inches thick. The upper seam of coal, besides being of inferior quality, is only one foot thick, and is not removed by the miners, but is allowed to remain and support the roof, which is firm and easily sustained.

The coal produced is of a fine black lustrous color, with brilliant couchoidal fracture, free from irou pyrites and sulphur, not liable to spontaueous combustion, aud burns without the disagreeable odor so frequently accompanyiug coals of this nature. When burned, the residuum is almost wholly white ashes. The amount that can be obtained from the mines now working, or to be worked in future, must depend solely on the facilities provided for mining and transportation. That a very large supply for the future is still to be developed is a fact well enough established.

The Hardy Coal Mine

Is the name given to one comparatively recently opened and now almost ready for supplying the market. The Company is represented by San Francisco bnsiness men, who have expended about $30,000 in improvements, besides the first-cost of the land. They have purchased 1,700 acres on the north side of the bay, eight miles uortheast of the entrance. This tract lies between Hayne's and Jordan's Sloughs, and fronts upon the bay. A good depth of water is found all along the westeru border. Fourteen feet at low tide, being the same depth as that on the bar, is found 400 fset from the shore, directly opposite the mine. The land rises gradnally from the bay to a hight ranging from 200 to 500 feet, and is densely timbered with fir and cedar. The coal is found in a regular bed, four to five feet in thickness on all sides of the tract, the outcroppings being found on the easterly slope for a distance of two miles. On the northwest corner, near the bay, the coal has been uncovered for the purpose of testing the average capacity of the mine. The improvements already nearly completed are situated in the southwest frout near the confluence of Jordan's Slough with the bay. The wharf is about half finished and is being prepared for a double track. Leaviug the wharf, the track extends with a slightly ascending grade to the mouth of the tunnel, which penetrates the hill aud reaches the coal bed. The tunnel is 1,000 feet long, 10 feet wide and 6½ feet high and is provided with double tracks. It now remains to open ont the chambers to the right and left and extract the coal from the portion of the bed which is inclined above the tunnel. The quantity lyiug north and east of the end of the tunnel, and which may all be extracted without machinery for either raising or freeing the mine of water, is estimated at not less than 1,200,000 tons, and the whole amonnt of coal on the tract at three times that amount. A boarding-house, buuk-ers, blacksmith shops and other improvements comprise the work already completed. It is expected soon to have the miue in active operation.

There has been some talk of organizing a line of propellers specially constructed for this coal trade. If done, the enterprise will greatly facilitate the working aud thorough development of these mines and will greatly tend to regulate the price of coal in this market.

Other places are well known as good points for opening mines, while there are many which at present are not available for want of ready means for transportation.—*Alta.*

The Ava Watts District.

The Ava Watts District lies between Bitter and Kingston Springs, on the Salt Lske road, and is situated at a distance of two hundred miles to the northeast of this city, and about thirty-five miles from the boundary line of the Stste. Although new and undeveloped, the first location having heen made in November last, the ledges that have already been discovered and partly prospected, justify the opiniou entertained that its ores are as rich as any other district ou the coast. The ores of the district are chiefly of a high grade character, and consist of copper and silver. The leads are wide and well defined, ranging from seven to thirty feet. Sixteen or eighteen locations only have been made. The Summit mine is represeuted as being a very valuable piece of property. The vein is thirty-two feet wide, and contains high grade ore, which will yield $300 to the ton in silver, while mnch of it will run as high as $2,800 per ton. There are now from three to four hundred tons of rock on the ground ready for milhng. The San Francisco mine, in whi h Capt. Moss is interested, is not as rich. The average of assays made hy Parker Handy, in New York, gave a result of $320 per ton. The San Francisco lode has been prospected to a depth of fifty feet, and continues of a uniform width and richness. One shipment of ore of a ton and a half has already beeu dispatched to San Francisco for reduction, and another lot of four tons and a half is now *en route* to this city from the mines. The district is represented as being well supplied with water, aud fuel is abundaut. A good wagon road connects it with this city—the Salt Lake road, which leads to within six miles and a half of the district, the turn-off being at a point twenty-five miles on the other side of Bitter Springs. The aborigines—a tribe of Piutes—are peaceable aud numerically weak, not exceeding one-huudred in number.—*Los Angeles News.*

CURIOSITY.—A male calf has heen dropped on Mr. Wheaton's ranch, Tule river, which would psss for a bear on account of its shape and the way it travels. It has the split hoofs of the genus calf, but its knees are turned the wrong way, and it nses all the leg below the knee as a foot. Its body is thick and short like a bear's, and for three weeks it could not reach up to the maternal fountain, but had to be lifted up. It is six weeks old and only fourteen inches high. It ambles like a bear, and when in motion, lifts and rolls its hack, just like one of the bruin family. Bears are plenty thereabouts, and the old cow probably got hadly frightened at one. *Delta.*

A LETTER from Montevideo states that while Professor Agassiz and several of his party were collecting geological specimens and putting pieces of rock in their pockets, they were arrested and pnt in the guard house, but were soon released. Imagine the Professor's intense disgust at being arrested for pursuing his researches in aid of of the cause of science.

SCIENTIFIC PROGRESS.

Extinguishing the Electric Light by the Approach of a Magnet.

Prof. E. J. Houston of the Central High School, Phila., calls attention, in the *Journal of the Franklin Institute* to an interesting fact which he thinks may have hitherto escaped observation. Having occasion to set up a large battery for experimental illustration of the properties of the light of the voltaic arch, he employed a battery of eighty half gallon cells. When first set up the arch between the carbon electrodes measured fully two inches, while the flame frequently reached an equal distance above the upper carbon.

The phenomenon to which he calls attention is stated as follows:—

Wishing to show the well known experiment of the rotation of the light by a magnet, he approached a compound bar-magnet to the light, holding it with one end pointing directly to the arch, in a horizontal plane equidistant between the carbon electrodes. When the nearest end of the magnet was within about four inches of the electrodes, the light was instantly extinguished.

Thinking that the extinguishing of the light was produced by some cause other than the approach of the magnet, the experiment was repeatedly tried in a number of ways, until it was clearly shown that the cause could not be attributed to accident, but to the approach of the magnet.

Though he has failed to find any published notice of this phenomenon, he thinks it probable that it may already have been observed, as the conditions of the experiment would be almost exactly reproduced whenever the rotation of the light of the voltaic arch by the magnet was tried. Still it may be conceived that though the necessary conditions for success in this experiment have often been *nearly* reproduced; they have seldom, if ever, been exactly reproduced, for it was noticed that in no case was the light extinguished, unless the length of the arch was nearly as great as the tension of the electricity admitted; that is unless the electrodes were separated by nearly their maximum distance, consistent with the passage of the current. Were this condition not observed in all cases, the approach of the magnet produced no other effect than the rotation of the light, until it assumed a position in a vertical plane 90° from a similar plane passing through the magnetic axis of the bar. Then, again, another necessary condition is that both the tension and the quantity of the current be of a strength greater than that of the current on which the experiment of rotation is generally tried. He has experimented with flames when these latter conditions were absent, and although the rotation was observed, the extinguishing of the light was in no instance produced.

The compound bar magnet employed is formed of three bars, held together by brass screws. It is one foot long, one inch broad and three-quarters of an inch thick, and is not at all remarkable for the strength of its magnetism.

As to the cause of the phenomenon, he thinks it may be attributed to the tendency of the flame to rotate on the approach of the magnet. This might cause an extinguishing of the light in two ways; either by the irregularities on the surfaces of the carbon electrodes offering greater resistance to the passage of the current from some points than from others, or by the current being unable to pass through the greater distance of the arched path, which is always assumed by the light on the approach of a magnet.

Another assumption, which, though perhaps not as simple as those already mentioned, at least as probable, is that on the approach of the magnet, there is a slight increase in the non-conducting power of the medium between the electrodes, produced by their polarization, and which, though always acting, can only manifest itself in a striking manner when the distance between the electrodes is near a maximum, and the tension of the current is exerted to the utmost in passing through the non-conducting medium.

The assumption of the polarization of the medium between the electrodes, and its consequently diminished power of conducting the current, seems to be somewhat sustained by the fact, that a powerful electro-magnet, in the form of a horse shoe, when approached, did not extinguish the light, although it produced rotation of the current, for we may conceive that the two poles, acting simultaneously on the medium, would neutralize each others effects.

He noticed, on several occasions, that the south pole of the magnet would not extinguish the light until it was approached one inch nearer than the north pole, namely, to within three inches of the electrodes. This, however, may have been accidental.

Temperature of Lavas.—According to the investigations of Dr. Fuchs, of Heidleberg, it would appear from a study of the chemical processes which take place in lavas at the moment of eruption, and by the observation of the broken crystals in the lava, that the melted masses some time before the eruption must have had a higher temperature than at the moment of eruption

Ball Lightning.

At a meeting of the Am. Polytechnic at New York, March 20th, it was remarked that Mr. C. F. Varley has recently given to the Royal Society of London an account of new experiments made with a Holtz electric machine, having brass balls at the poles about an inch in diameter. A strip of wood about three inches in length, was bent around the negative pole, so as to project on each side of it towards the positive pole. On rotating the machine, two bright spots are seen on the positive pole. If the positive pole be made to rotate on its axis at the same time, the luminous spots do not rotate with it; but when the negative pole, with its filament of wood, is rotated, the spots on the positive pole rotate also. On interposing a non-conductor, like plate-glass, between the poles, the luminous spots disappear. On removing the wood from the negative pole, there was sometimes a glow over a large portion of the surface of the positive ball. If, in this state, two or three small pieces of sealing-wax, or even a drop of water, be placed on the negative pole, corresponding non-luminous spots will appear on the positive pole, and these spots will rotate when the negative pole is rotated.

It is evident that lines of force pass through the intervening air from the negative pole to the positive, a distance of about eight inches. This experiment, Mr. Varley believes, may explain the cause of "ball lightning." If a cloud be negatively electrified sufficiently strong to produce a flash from the earth, a point on such cloud would correspond to the projection of wood on the negative pole of the electric machine; and such point moving along the surface of the cloud would cause a responsitive action near the surface of the earth, and a luminous spot would appear, which has been described as "ball lightning" by those who have witnessed this rare phenomenon.

In relation to the above, Dr. Bradley said:—"I think I have seen ball lightning. I saw it go into a mill, and it was all in flames in an instant. It seems to be totally unaccountable."

Dr. Van Der Weyde also said that he had once seen a ball of lightning, and that this was the first explanation of the phenomena which he had ever met with, having any appearance of truth.

The Asteroids.—The recent announcement by Dr. R. Luther, of Europe, of the discovery of another asteroid (the 118th) in connection with the reported disappearance of a fixed star, reminds us of the fact that quite a number of the smaller asteroids have taken themselves out of telescopic ken, and it is still uncertain whether they are coming back. In view of these disappearances, Professor Peters, of Hamilton College is opposed to putting any more on the list until observation has made it certain that they have "come to stay." Our older readers will remember that in their school days there were only four asteroids known to the text-books—Ceres, Pallas, Juno and Vesta, discovered respectively in 1801, 1802, 1804 and 1807. It was not till 1845 that a fifth was added to the list by Hencke, of Dresden. The number had slowly increased to 29, when American science took a hand in the person of Professor Fergusson, of Washington, who added Euphrosine in 1854. Of the total 118, 61 have been discovered since 1859. Those first seen and named in this country number, we believe, 28. The best years for asteroids have been 1857, 1861 and 1868. In the first, 8 were added to the list; in the second 10; and, in '68, the unprecedented number of 12.

Disappearance of a Star.—A gentleman of this city announces the fact, through the *Alta*, that the star Mu Leonis, of the third magnitude has recently disappeared. This star was one of the cluster which forms the sickle, and was the third in the blade, reckoning from the handle. His attention was called to the star some two weeks since, when it was shining with its usual brilliancy, visible to the naked eye. He first observed its disappearance on the 26th ult., but thought it possible that some peculiar condition of the atmosphere rendered it invisible. However, upon making a close scrutiny he found that the star had actually disappeared. At nine o'clock in the evening the sickle may now be seen in San Francisco, at which time it will be found situated a little north of west, and at a distance from the zenith of about 40°

Much interest will be felt to learn whether this reported disappearance is confirmed by Eastern observers, and also to hear what phenomena with regard to the same may have been observed with the larger and more powerful instruments in use at other localities.

Origin of Coal.—According to Prof. Wurtz, the formation of coal depends entirely upon the action of the iron which was dissolved in the waters of the coal period. The combinations of iron with which coal is always accompanied are pyrites, iron spar, and hydrated oxide. These were doubtless derived from the strata interjected between the coal beds. In this case the oxygenated water appeared to act upon the metallic sulphurets which were contained in the crystalline slates, from the destruction of which these coal strata were derived. Coal, consequently, is the normal result of the eremacausis of organic substances in waters which contain sulphate of iron and free carbonic acid. An immense pressure upon the mass, while in a plastic condition, was also, without doubt, an additional element of importance.

MECHANICAL PROGRESS.

Crystallization in Wrought Iron.—Much discussion and much diverse opinion has been observed on the assumption that wrought iron, under certain conditions, as for instance under long continued vibration changes its molecular arrangement from fibrous to crystalline. An exchange sums up the different authorities on this subject as follows:

Mr. Robert Stephenson was unable to satisfy himself from a large experience that any such molecular change in fibrous iron took place, and referred to the beam of a Cornish engine, which, working eight or ten strokes a minute for more than twenty years, under a strain of 50 lbs. per inch, and the connecting-rod of a locomotive, vibrating eight times a second for several years of regular work, making more than 200,000,000 times, yet remained uninjured; and he considers these facts good grounds for doubting that iron changes its state in axles.

Many engineers have doubted that any axle which, when broken, proved to be crystalline had ever been fibrous in its character. Others maintain that the change does not take place unless the iron is strained beyond its limit of elasticity. One of the most striking examples of the change is shown in the chain slings used for carrying the bars during the process of hammering at a forge, and also to the porter bars attached to the blooms while under the hammer, both of which are know to become very brittle after a few months.

Mr. Thorneycroft (England) considered that the internal structure of iron undergoes no change unless there be a change of form; that simple vibration will not destroy the fiber, whereas bending, if long continued, would change the most fibrous iron to crystalline.

Mr. Roebling states that the most fibrous bar may be broken so as to show a granular and somewhat crystalline fracture, and this without undergoing any molecular change in the texture. "Take," he says, "a fibrous bar, 10 feet long, nip it in the center all around with a cold chisel, then poise the bar upon the short edge of a large anvil and a short piece of iron placed eight or nine inches from the edge on the face of the anvil, and strike a few heavy blows upon the nip so that each blow will cause the bar to rebound and to vibrate intensely, and the result will be a granular and somewhat crystalline fracture. Now take up the two halves and nip them all round again, about one or two inches from the fractured ends, and break them off by easy blows over the *round* edge of the anvil, and the fiber will appear again.

This experiment proves that a break caused by sudden jars and intense vibration may *show* a granular and even crystalline fracture, *without having changed the molecular arrangement of the iron.* All fibers are composed of mineral crystals drawn out and elongated or flattened, and the fracture may be produced so as to exhibit in the same bar, and within the same inch of bar, either more fiber or more crystal. But a course crystalline bar will under no circumstances exhibit fiber, nor will a well-worked out fiber exhibit coarse crystals.

Mr. Roebling concludes that a molecular change, or so-called granulation or crystallization, in consequence of vibration or tension, or both combined, has in no instance been satisfactorily proved or demonstrated by experiments; but that vibration and tension combined will greatly affect the strength of iron *without* changing its fibrous texture, and that this loss of strength bears a due proportion to the extent and duration of the vibration and tension.

Weather Waste of Coal.

The loss suffered by the exposure of coal to the weather is much greater than most people suppose. Dr. Varrentrapp has made this subject a matter of careful investigation, and the results of his analyses show in some cases a total loss in weight of a specimen, from this cause, amounting to 38.08 per cent., while its deterioration in quality for purposes of fuel or gas-making reached a still higher figure.

This change consists in a slow combustion, in which the volatile constituents—which are most valuable combustible elements—are gradually eliminated, while the relative proportions of carbon, ash and sulphur are comparatively augmented. It might be expected, now that the nature of this change is indicated, that anthracite (which has already gone through a very similar process in becoming what it is, by the loss of its bituminous matter) should suffer least of all coals from this action, and the result of anlysis shows this to be the case. The density and compactness of this variety, aside from its chemical character, protect it in no inconsiderable degree. The cannel coals rank next in their power to resist deterioration from this source; while the bituminous varieties are the most susceptible.

The experiments of Dr. Varrentrapp are of such direct and practical importance that all who are engaged in the mining, transportation, storage or consumption of coal can study them with profit. It appears, from accurate tests of a number of samples before and after exposure, that all the valuable properties of the coal had deteriorated.

The coking quality of the weathered coal diminishes with its gas-yielding quality, the author informing us that a sample of coal yielding, when freshly mined, a firm coherent coke, after eleven days' exposure, yielded a coke of no coherence, and in all the samples tested the rule was absolute that the longer the coal had been exposed the greater was the inferiority in the quality of the coke it produced.

The gas-yielding quality decreased in one instance 45 per cent., and the heating power 47 per cent.; while the same sample under cover lost in the same time but 24 per cent. for gas purposes, and 12 per cent. for fuel. These experiments go far to explain the almost universal inferiority of the slack or waste coals in heating power when prepared for burning, even though some combustible material like pitch or tar is used in their cementation. It indicates too, the imperative necessity of keeping coals amply protected from the deteriorating action of the air and moisture by keeping them constantly dry and under cover.—*Journal Franklin Institute.*

Vitrified Marble.

A substance, known under this appellation has recently been brought out in England which promises to find its way into very large and varied use. The material itself results from the admixture, and melting together in a furnace, of equal parts of certain vitreous, and silicious substances in about equal proportions, to which are added at a suitable stage and in the requisite quantities, such coloring materials as will produce the desired effects, either as a plain body-color equally diffused throughout the mass, or in veins of one or more colors with or without ground. When in a semi-fluid state, while yet hot, small or large masses of this plastic matter are cut off and pressed into iron or steel moulds carefully formed to the desired shape. In this manner decorative objects of any size, shape, or appearance can be produced with the utmost facility and rapidity of execution.

The manner in which natural materials of all kinds can be imitatively reproduced is extraordinary; ordinary marbles, veined and other, porphyry and malachite, jade, lapis lazuli, etc., thus prepared closely resemble the genuine objects themselves, and have the advantage of being in forms that it could only be obtained out of the originals with great labor, waste, and cost. They can also be obtained and applied in bulk and solid masses, as for vases, paperweights, inkstands, table tops, etc., or in minuter portions, such as patenæ and tesseræ, or emorphous pièces for mosaic work in every variety, suitable for pavements, etc. For the latter purpose the vitrified paving possesses an important advantage over marble and encaustic tiles, in relation to the surface, which is rougher, and more safe and pleasant to tread upon, giving good foothold and equable wear, while lending itself to every pattern, regular or the reverse.

When to the above advantages are added the essential qualification of economy, whether from the point of view of first cost or of maintenance and repairs, it is thought that this material must eventually command a wide field of practical application and use, supply a great want, and establish for itself a high and permanent position among the appliances of building and construction.

Boiler Explosions.—It appears from carefully compiled data that a large share of accidents which occur from boiler explosions are due mainly to bad construction of the boilers. The facts presented in American experience are also confirmed by the records of explosions which have taken place in Great Britain. Thus, of 297 explosions which occurred within a given time in that country, 120 were due to malconstruction of the boilers, 88 to defective condition of the boilers, 44 to the failure of the seams or rivets at the bottom of externally-fired boilers, 38 to overheating of the plates, 5 to excessive pressure of steam caused by interference with the safety-valve, and 2 to causes not distinctly made out. For every blow-up due to the neglect of the attendant, there were six chargeable to the carelessness or ignorance of the boiler-maker or boiler-owner.

It is thus quite evident that the causes which lead to most of these disasters are neither accidental nor mysterious, but are of the simplest character and easily preventible by common knowledge and common care, and it is about time that measures should be taken to enforce such precautions as are necessary to secure the public from the dangers which now continually threaten them in this connection.

Coal Cutting Machinery.—There is now every prospect that the getting of coal by machinery will be more generally adopted in the British mines, than has hitherto been the case. At present it has only been adopted at a few places, but a new machine, patented by Messrs. Gillott & Copley, has recently been tested near Barnsley, in the presence of a number of mining engineers from various parts of the kingdom, and with the most satisfactory results. In 136 minutes a bank of coal, 58 yards long and four feet eight inches thick, was cut to a depth of three feet one inch. The quantity of coal so cut would be about 80 tons in the time stated. It brings down the coal in vast blocks, effecting a great saving by making little or no slack, as wedges and gunpowder make from 25 to 40 per cent. The owners of the Oaks Colliery are so satisfied with the machine that they have given orders for four of them.

Carburetted Air in the Iron Manufacture.—It is stated in the *Journal of the Franklin Institute*, that in certain smelting establishments in Europe, the experiment is being tried, and with success, of using air carburreted by its passage over petroleum, in the reduction of iron from its ores.

MINING SUMMARY.

THE following is mostly cond nsed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Monitor *Miner*, May 25: THE ORE in Monitor No 3 west drift is looking well.

TARSHISH.—This mill started up again a few days since.

BUTTE COUNTY.

FORBESTOWN.— Oroville *Record*, June 1: The mines are paying well. Fowler & Howland will soon start their quartz mill.

CALAVERAS COUNTY.

GWIN MINE.—Calaveras *Chronicle*, June 1: Operations are progressing favorably· Rock is being taken from the 500-ft. level in the south shaft and from the 350-ft. level in the north shaft. The ore is the best yet uncovered. Only a portion of the stampe are running. The great central shaft being sunk has reached 50 ft.

GOON ROCK.—6 tons of rock from the Zacetara, at West Point were recently worked, yielding $420—an average of $70 per ton.

GOON YIELN.—The gravel claim of Brackett & Co., in Chili Gulch, continues to "pan out" handsomely. 15 men are employed and the yield approximatee $700 per week.

SAN BRUNO.—The work of taking out rock hae been re-commenced in the San Bruno mine, Mosquito Gulch. The last rock taken yielded $175 per ton.

PRUSSIAN HILL.—The mill being erected on this mine is nearly in readiness to start.

WEST POINT.—Bartolo mine—test rock, 3,800 lbs. yielded $139.

PETTICOAT.—Work has been resumed on the mine at Railroad Flat.

WOLVERINE.—A depth of 200 ft. has been reached, at which point the ledge shows wider and richer than any where nearer the surface.

ENORMOUS YIELN.—This week Mr. Schlnnd showed us a gold bar weighing $800, the product of 5 tons of rock from the mine of Herryhause &. Co. at Mosquito Gulch.

CAVEN.—The npper tunnel in the San Bruno mine at Mosquito Gulch has caved so badly that it will require several weeks' work to remove the *debris* and repair damages.

INDIAN CREEK MINE.—San Andreas *Citizen*, June 1: A run of 4 tons of rock was made last week and cleaned up $600.

LLOYN'S LEAD.—At the "clean up" on this claim 62 oz. were netted.

STICKLES MINE.—Down over 275 ft. At 260 ft. a level is heing run, the rock from which psys over $25 to the ton, mill process.

DOG TOWN.—The tunnel claim of Carley & Co., is in near 700 ft., and dirt has been struck which paid as high as $100 to the pan.

ANGELS QUARTZ.—Has reached 625 ft. At 500 ft. a level has been rnn, the ore from which is crushed in a 30-stamp-mill, paying over $20 to the ton.

INYO COUNTY.

KEARSAGE.—Inyo *Independent*, May 25: Within the next 2 or 3 weeks the Kearsage will resnme active operatioue.

NEVADA COUNTY.

THE SITUATION.—G. V. *Union*, June 2: The Idaho is flourishing. In the Eureka a cross cnt is being rnn from the fourth level, on a northerly course to strike the Mohile ledge.

The developments to westward in the Coe mine at the 350 ft. level continue very flattering.

Independence Co. is driving a tunnel into Independence Hill.

OMEGA.—Fuller, Pease & Co., cleaned up a splendid lot of fine gold a few days ago. Tully & Co. have commenced to clean the bed-rock.

MT. AUBURN CO.—Nevada *Transcript*, May 31: The Co. propose to pnt in 10 stamps to start with, and add 20 or 30 more as soon as necessary.

PLUMAS COUNTY.

PAYING BIG.—Quincy *National*, May 25: The Eureka Co. recently shipped $19,000, the result of 16 days' run; with 24 stamps.

SAN DIEGO COUNTY.

THE MINES.—S. D. *Bulletin*, May 25: Defrees' mill cleaned np last week $4,000 from a rnn on Owen's rock, 112 tons. The Stonewall mill is running day and night. Pierce & Reynolds' mill will start this week. The Swain boye are going to commence einking on the Good Hope claim, and we hear that work is to be resumed on the old Washington.

SIERRA COUNTY.

PORT WINE.—Downieville *Messenger*, May 25: The Slope Co. are working in excellent gravel.

The Union Co. are working gronnd that prospects well.

The Indian Queen Co. are taking out good pay grit, and making fair wages.

TUOLUMNE COUNTY.

GOPHER CLAIM.—Sonora *Independent*, June 1: The rock averages well, and the Co. have just erected several arastras.

Nevada.

EUREKA DISTRICT.

STRIKE.—Eureka *Sentinel*, May 30: An important development was made in the Eureka Con. yesterday, at the end of the Lawton tnunel. A splendid body of high grade ore, not previously known to exist, was cut.

HUNTER DIST.—The mines are very promising. Assays from the Petersburgh gave $1,140.16 silver.

The Home Ticket ledge ie from 25 to 40 ft. wide, the ore assaying about $47 per ton. The Emma is 12 ft. wide and the ore is supposed to be good. Monte Negro (Black Mountain) is a ledge 4 ft. wide, and the average assays range from $300 to $2,000.

PROSPECTINO.—Just now prospecting is lively among our people, and the hills are full of men.

WILL START UP.—The new eteam hoisting works of the Phenix Co. will start up the present week.

ELY DISTRICT.

BULLION.—Ely *Record*, May 26: During the past week, W F & Co, shipped hullion to the amount $122,661.08.

PIOCHE.—The Chicago Mill commenced rnnning on ore from this mine on the 12th of the present month, and up to the 22d inst., the snm of $23,819.32 had been shipped as the result. The 5th station drift is in 220 ft. from the shaft, with 80 feet more to drive to cut the vein.

CHIEF OF THE HILL is now running west drift ahead, which is in 20 ft. the air being good here. Abont 150 tons of fine ore is on the dump.

THE drift in the Spring Mountain tunnel from the station in winze is in 16 ft. Have jnst commenced running a drift west from the same station. Good ore ehows throughout the ledge in both drifts.

SETTING SUN.—Shaft down 45 ft. and still sinking with 2 shifts. The ledge shows well and is 4 ft wide.

CONDOR.—Assays on ore from the ledge in the lower shaft on Thursday last go as high as $613.21 and five assays of ore, taken from different parts of the ledge, show an average of $202.75.

AMELIA.—The ledge is 4 ft. in width, carrying mineral througout, the average assays from which during the past week have shown $105.66.

BOWERY.—Have resumed work on the old gronnd. Now drifting west 53 ft. from the surface. The north drift in the new ground is in 60 ft. from the bottom of the new shaft.

EXCELSIOR.—Stoping has heeu commenced. Assaye from the ledge in the winze eunk on bottom drift show $464.72. The winze will be sunk to 100 ft. and a new level then opened.

NEWTON BOOTH.—Intend sinking the shaft 400 ft. before drifting any more.

FREIBERG DIST.—The Co. owning the Morning Star have completed their emelting furnace, and have several parties engaged in burning charcoal. The main shaft is down 100 ft. at which point a cut was started across the ledge, which was run 25 ft. through ore all the way, before the hanging wall was struck. In this immense deposit of ore, there is a very rich streak about 6 ft. wide; and experienced miners estimate the average yield of the whole lead to be fully $100 per ton. The ore is argentiferons galena; but it is represented that milling ore has been struck in the bottom of the shaft.

STRIKE.—On Saturday last the workmen in the Newark mine cnt into a fine body of ore in the bottom of the winze being sunk on the lower level. The ore body shows in the ledge from 20 inches to two feet in width, and specimens exhibited to ue show plenty of chlorides slightly mixed with good galena.

HUMBOLDT.

BULLION.—Unionville *Silver State*, June 1: Amount shipped from the Arizona, since our last issne, was $7,270.

CENTRAL DISTRICT.—Humboldt *Register*, May 5: The mines are giving good yields of ore, ranging from $50 to $100 per ton, in value. The Marietta Co. have made a rich strike at 150 ft. from the surface. They have also a 4 ft. vein of splendid ore at the 35 ft. level.

REESE RIVER.

FREEHOLD.—Reese River *Reivelle*, May 25: McClusky and Brannan have a shaft down 80 ft. They struck the lead in the cross-cut yesterday.

SAYBROOK.—Running on the ledge at the 150 ft. east level and getting ore; ore also coming in from the 110-ft. level; about 12 tons on the dnmp.

SARATOGA.—Some of the very best of ore is steadily coming ont.

IOWA TUNNEL.—There is but little doubt that the old Hubbard ledge has been tapped by this tunnel, and the prospects for obtaining large quantities of good ore from the several ledges cut by the tunnel are very flattering.

LANE AND FULLER—PACIFIC CO.—Ore everywhere, in large quantities and of a high grade. Rock is again being ehipped to the Manhattan Mill for reduction. The ore house is nearly full and everything looks prosperous. The mine never looked better.

ESTHER.—This mine is shut down.

GIRARD.—Stripping the ledge at the west level and getting good ore.

GROVE TUNNEL.—Good ore coming from the end of the tunnel and from the east level of the main incline.

DOLLARHIDE INCLINE.—A prospecting drift, or cross-cut, is being run for the ledge.

WHITLATCH UNION—Everything looks gloriously encouraging.

YANKEE BLADE.—The mines all look well and are turning out considerable quantitiee of good ore.

VIRGINIA SHAFT.—Thos. O'Kane ie etill getting good ore from the 100-ft. level.

KLING & KELLEY.—Taking ont 2 tons daily of $300 ore.

ENSIGN.—Ensign & Co. are working the ledge throngh an incline 50 ft. deep, and getting good ore from both the east and west levels.

BELMONT—MONITOR.—The force has been increased to 15 men who are stoping out fine ore from the 140-ft. level below the tunnel south.

BELMONT CO.—The first screach of the whistle of their new hoisting works on the Canfield mine was given on Thnrsday. The machinery will be ready in a few days.

EL DORADO.—Workin 40 men—sinking and running level. The black metal ore in the bottom of the incline is increasing. The 240-ft. level is being extended south with fair prospects of cutting the rich south chimney at this depth. Considerable fine sulphuret ore is being taken out of of the lower north level.

WASHOE.

LOCAL SUMMARY.—Gold Hill *News*, June 1: SAVAGE.—They are stoping and raising on the ore body on the 1,300-ft, level, which is improving in qnality. They are also breasting out on the ore body in the winze on the 1,400-ft. level, finding as yet no limit to the extent.

SAPPHIRE.—An open cut on the surface near the middle of the location, has been run across the ledge 20 ft., and has not yet reached the west wall, and a tunnel has been driven in about 60 ft. below the croppings, exposing a ledge 47 ft. in width, from which ore has been taken that mills from $8 to $24 per ton.

BEECHER.—Daily yield 275 tons, from the 1,100 and 1,000 ft. levels. The main incline is down 380 ft., or 19 ft. below the 1,000-ft level. The drift west from the 1,100-ft. level, to intersect the bottom of the winze, has about 60 ft. further to go in order to reach the point of intersection. The new hoisting-works machinery will be completed and started up next week.

QUINN MINE.—A shaft is down 60 ft., which in sinking cut through ore assaying $80 per ton and drifting is commenced, expecting to strike the ledge at a distance of abont 30 ft.

WOONVILLE.—The shaft is 156 ft. deep, and sinking deeper is being continued. The mine is yielding 30 tons per day, which mills $32 per ton. The bullion is worth $6 per ounce, containing a large proportion of gold.

CROWN POINT.—Owing to trouble with the water tapped at the 1,300-ft. level, the ore yield hss fallen off to about 300 tons per day. The water drove the miners out of the 1,300 ft. or lowest level, and the pumps proved inadequate to reduce it.

IMPERIAL EMPIRE.—The drifts at the 1,650-ft. level toward the Imperial and the Empire mines respectively are each in about 75 ft., and the indications are snch that with each fresh blast the west wall of the ledge is expected to be penetrated.

MCMEANS.—The ledge in the south tunnel is looking better and better and more extensive as further developed, and assaye as high as $85 to the ton.

OVERMAN.—The pumps being in, sinking for a new level will he resumed in 3 or 4 days. The drift for the ledge at the 1000-ft level is in 166 ft., and the indications are very favorable for running into a body of of ore shortly.

SUTRO TUNNEL,—A little over 2,000 ft. in length, and penetrating farther west at a good rate.

JULIA.—Shaft 816 ft. deep and excellent progress being made. It is passing through an extensive ore body, some of which assays very well.

CHOLLAR-POTOSI. — Daily yield about 170 tons, of the average assay value of $40.20. All the ore sections are looking and yielding well.

BUCKEYE.—Daily yield 22 tons, of the assay value of $12 per ton. Tho new ore development in the south drift at the 100-ft. level is looking better than ever.

SILVER HILL.—Shaft enlarged and thoroughly retimbered to the depth of 110 ft.

GOULD & CURRY.—Both the north and south drifts on the 1500-ft. level are being driven ahead with dispatch. The incline is down sbont 50 ft., and progressing slowly.

KENTUCK.—The old workings still continne to pan out a few tons a day.

CONS. VIRGINIA.—The work of prospecting and developing at the 500 ft. level still vigorously going on.

HALE & NORCROSS.—The ore is not paying or promising quite as well.

CALEDONIA.—Shaft 696 ft. deep, and sinking deeper at a satisfactory rate. A drift for the ledge at the 400 ft. level has been started, and is being pnshed ahead fast.

JUSTICE.—Water reduced sufficiently to allow work being done in the 400 ft. level.

KNICKERBOCKER.—Shaft down 275 ft. and sinking at the rate of from 2 to 3 ft. daily. Hoisting works rapidly advancing towards completion.

ARIZONA AND UTAH.—Some very good milling ore is coming from the upper workinge adjoining the Globe, developed by the raise from the tnnnel.

BALTIMORE.—Shaft sinking at the rate of 2 ft. a day. Hoisting works building completed and the machinery willl be ready to start in a few days.

NEW YORK CONS.—Shaft sinking at the rate of 4 ft. a day, and showing coustant improvement in the ore indications as further depth ie attained.

COOK & GEYER.—Yielding about 40 tons per day. Plenty of ore in sight, and running 2 mills. It ie gold ore averaging $18 or $20 per ton.

GOLD HILL TUNNEL.—The new shaft is down 36 ft. in ore some of which assaye well. The work progresses eatiefactorily.

SIERRA NEVADA.—Daily yield about 50 tons, from the lower workings, keeping tho Co's. mill steadily running.

OCCIDENTAL.—Main shaft at the 600 ft. level being still driven north in tho ore vein at a satisfactory rate.

DANEY.—Shaft down 550 ft. Drifting at the 500 ft. level progressing well with good prospects.

JACOB LITTLE.—This mine, on Cedar Hill, is yielding some very good ore at present.

AFTER ORE.—Virginia *Enterprise:* Workmen are engaged at the old dumps of the Imperial, Bacon and Empire, at the upper end of Main st., Gold Hill, in cleaning up and saving the ore which in former times was wasted by falling from the cars and chutes.

WHITE PINE.

TREASURE HILL MINES.—MAMMOTH.—The ore croppings have been traced for over 500 ft. At present the whole force of men is at work in the open cut, breasting out in ore that assays from $25 to $150 to the ton in silver, and $5 to $10 in gold. The ore on the dump, when assorted, will amonnt to about 500 tons.

NORTH AUBORA.—The De Pass chamber, north of the Ridsdale chamber, promises from present appearances to be the most extensive body of ore ever found on Treasure Hill. The ore in the southeast chamber leading from Lady's chamber is improving. Connection is made with the winze of the Phillpott's chamber.

BEECHER CON. M. & M. Co.—There is a large amount of ore piled back in the Beecher, which will be hoisted eoon and shipped to mill. There is a marked improvement in the Anchor incline since last review.

GEN. LEE.—Running drift east on spar seam. Extracting ore and piling on the dump.

EAST SHEBOYGAN.—There is a large amount of ore on the dumps.

COPPER GLANCE.—The face of the drift has opened into ore of good qnality, with every appearance of being a large body.

SOUTH AURORA.—Running drift from big cut to strike the ore channel.

ICEBERG.—Logan and others leased the ground recently, and have made a strike of rich ore, which promises to hold out.

EBERHARDT.—Breasting ont west from the Keyestone shaft, and running out ore to No. 15 station. The ore in sight is of a high grade, but limited in quantity.

WARD BEECHER.—Working for an opening. Will commence breasting out and hoisting to the surface about the middle of next week.

NOONDAY.—Breasting out as usnal, with a force of 7 men. Width of ledge will average 6 ft. Assorting the dnmps, and will ship to mill next month.

OUTSIDE DISTS.—STIRLING.—A shaft is down, and a body of ore developed in the 50-ft. level, which assays $65 to $90 the ton. At 110 ft. down the ledge has widened and quality of ore much improved.

Arizona.

MINES AND MINING.—Prescott *Miner*, May 18:

The mincs of the Benjamin series look very promising.

BRANSHAW DISTRICT.—The new shaft on the discovery location of the Tiger, is sunk 50ft.; the vein in said shaft is exceedingly good.

The shaft on the Benton is down about 40 ft., at which depth there ie an immense pile of very rich ore.

Mr. Linn has just returned from visiting the Del Pasco mill and mine, of which he speaks very favorably.

From Wickenburg, the news] is that Bill Smith's workmen have "struck" water, near the Vulture mine,

The news from Wallapai, is in effect that every confidence was felt in mincs and furnaces.

Placer mincrs near Prescott are doing well.

Colorado.

SHIPMENTS.—Colorado *Miner*, May 23: Hall & Co. have crushed, sampled and sacked, since last report, 45,550 lbs. of ore.

Bailey & Nott have sent forward, during the week, 96,072 lbs. of ore.

Campbell & Clark have forwarded 8,141 lbs. of ore.

ITEMS.—The Bagley & West works at Golden approach completion. They will be in operation in about 3 weeks. Capacity, 10 tons per day.

The Judd & Co's. works, the amalgamating room is up, and the roof going on. Work is going forward at a rapid rate in every direction.

Work is going forward under high pressure at the Stewart mill. The Arey furnace building is up and inclosed. The frames for the pans and settlers are in place.

The Hiawatha tunnel is in 415 ft., with fair prospects of soon striking a vein of mineral. The Wagoner tunnel iein 330 ft., and is looking very encouraging.

PELICAN.—One of the tunnels, now nearly to the lode, will strike the vein of 100 ft. below the present depth. The other, 1,000 ft. in length, will cut the crevice 300 ft. lower etill.

THE SPRINGS.—Mr. Gray will have his assay furnace in full blast in a few days. He proposes, with the increase of business, to add crushing and sampling, and eventually, concentration worke.

To the Thackara mill is to be added a blast furnace for smelting ores.

The Whale mill has been sold to English parties, who propose to erect smelting works.

The Sheldon Jackson lode, Virginia cañon, is turning out big. Some 6 tons of ore were taken out in 2 or 3 days, which rune 100 ozs., silver, and from 40 to 50 per cent. of galena per ton.

Chicago Creek mines are promising better than ever.

MILLS.—Central *Herald*, May 21st: The Leavitt mine ie supplying ore for 80 stamps, ranking next to the Kansas lode in its yield of gold.

Several mills have receatly been pnt in operstion in Black Hawk. Wheeler & Sallivan are running their 25 stamp mill on the Kaasas ore. B. S. Bnell is runniug 40 stamps at the New York mill, and will soon have the remaining 15 at work. Norton's mill (23 stamps) is running on Kent Co. ore for Nichols, Fisher & Co. There is talk of the Hnrd mill being leased. The Black Hawk, Mellor & Borum, Polar Star, Lake, Sensenderfer, Smith & Parmelee and Kimber & Fullerten mills, pound away without ceasing.

In Nevada some half a dozen mills are runaing. Below East Nevada, Rue and Bates & Son have been running their aills for several weeks.

Idaho.

Local Recorn.—Owyhee *Avalanche*, May 25: Mahogany.—This mine is tnruing ont splendid ore, sufficient to keep the South Chsriot mill pounding swsy. Now sinkiag a winze south of the shaft and below the 5th level. The ore in the winze is first class. The ledge also continues good iu the 5th level beth north and south.

South Chariot.—The shaft is through to the 4th level. The timber and lining will be all into No 4 in in a day or two. It has also sunk 35 ft. helow No. 4, and will he timbered the coming week.

Minnesota.—The ore-house is full, and preparatiou is bcing made to let out on the ground so that more can be put in.

Empire.—The shaft and wiuze are being sunk fast, and grading has commenced on the surface for the hoisting works which are on the way up. They have a magnificent lookiug ledge in the winze.

New Discovery.—Last week Charley Brunzell discovered a qnartz ledge about 300 ft. helow Brunzell's Hetel at Booneville. The vein is well defined and one and a half ft. in width.

Placer Mining.—Placer mining is in full blast, with the prospect of a much larger yield of gold dust than for several years past.

Montana.

The Park Mines.—Helena *Herald*, May 25: 50 miaers can find immediate employment on the Park, at $4 per day.

Big Nugget.—Perry Thoroughman brought to the city yesterday a very fine gold nugget, weighing over 20 ozs., taken from his mine on Scratch Gravel Bar, near the Fair Grounds. Its valne in gold coin is a little over $400.

Utah.

Pioneer Mill.—S. L. *Tribune*, May 27: The mill and furnace sre running steadily—conveyors working splendidly.

Bullion City.—Hesse & Hawley are working the Grest Western with good prospects, their tunnel heing in some 50 ft. Acerd snd McLauren are engaged on the Springtown and are ohtaiuing heautiful ore, heing in about 30 ft., and hsving gone 20 ft. throngh vein matter. Hamilton and Acord are working the Belcher mine close to Springtown, taking out good ore.

Camp Floyd.—Cor. same: Work on the Sparrow Hawk is steadily progressing, with a force of over 100 men, taking out excellent ore. On the Silver Circle I find ahout 25 men st work, who are daily increasing the large dumps of rich ore. The Hidden Hand, west of the Eclipse, and the Identical and Western World, opposite the Silver Circle, are coming out finely, snd are being developed hy their owners, who are practical miners. The clsims on Colorado Gulch, among them the Washington, Enterprise, Gen. Lowe and Rattlesnske, sre undergoing therongh devclopment with full force.

Ophir.—Cor. same: The Rambler on the north side of Ophir Hill shows a splendid body of carhonate, oxide, and sulphuret of lead ore, about 8 ft. wide.

Black Jack Canon.—Cor. ssme: A tunnel is in 60 ft., that will tap the ledge—when completed—at the depth of 170 ft. Three shifts working.

At the Idaho a new tunnel is in 50 ft. that will tsp the ledge at the depth ef 170 ft. Two shifts working.

Prominent among the many goed locstions that are heing worked, are the Ellsworth, Beehee, Alhamhra, Pride of the West, Judge McKesu, Old Photegrapher, and Alphs.

In the Lncky Boy they have tspped the discovery shaft at the depth of 71 ft., and are taking out chloride in ahnndsnce.

Mining Discoveries.—A rich gold discovery has receutly been made in Skookum Gulch, Deep Creek, ahout 12 milcs from Diamond City, Montana. The Helena *Herald* says it is reported that $2.50 to the pan has been ohtained hy prospectors.

A large ledge, assays from which average 30 per cent copper and from $40 to $140 in silver has heen fonnd in the mountains to the eastward of Home Mountaiu hy Jos. Organ and J. C. Kiukead. So says the Unionville *Silver State*.

Rust—Wheat in spots begin to show rust, but we hear of none that is yet thought to be seriously affected. There ia time enough however, for it to extend and work a good deal of injury, though we hope to escape any such disaster, saya the Contra Costa *Gazette*.

[Continued from page 353].

a lathe, the leather shonld be placed in a split chuck, and carefully trimmed, finally coated with tallow and French chalk, as previonsly stated.

For making cap leather, the form of die should he nsed as shown in fig. 2. The plunger die *C*, should be forced from the centre as before, by a pressure applied to the top. The centre piece, *A*, is reqnisite for facilitating the romoval of the leather from the die, *B*. It is necessary to make the dio, *C*, with a bell, guide *C*, to keep a perfeot central position with *B*. When the leather has set, the die, *C*, is to be removed, and the leathera to be pared off level. It should of course, when practicable, be finished in a lathe, and always fiaished by dressing with French chalk and tallow as above.

In constructing hat leathers, the arrangement of dies necessary, is shown in fig. 3. The outer-die with its central piece, will be easily understood from the description of the other figures. The leather is in this case laid with the grain upwards, while in the other case it is downwards. In order to form a flat brim to the leathor, the holding down cap, *D*, is provided with a screw as shown iu the die, *B*. It must not hold the leather too tight, otherwise the ram, *C*, will burst the centre of the dise. The upper part of *I*, should form the guide of the rams, *C*. After the leather is set, it should be dressed around the edge; the crown should he cut out *FF*, as at the lines. Both these trimmings are however done in the lathe with better satisfaction, and cannot fail in their requirements. Let it be understood that no sticky material is to be nsed until ready for use, otherwise they will collect dnst, which is above all to be avoided.

Having constructed our leather or packing, next is the insertion. Usually the leather is forced through a smaller die than its own, into a recess suited for nothing so well as its own speedy destruction. The corner of the recess being square, the pressure is admitted and the leather forced into that shape. The result is that instead of wearing evenly and equally it soon cuts through at the sharp corners produced. This is wrong. The proper way to insert a leather is by a ring, following close up on the top of the leather, and constructed to the formation of the leather as shown in Fig. 4. Here it will be seen that the leather is not passed through any diameter less than its own. At *Y* is inserted a close fitting ring of metal, shaped to receive the formation of the leather, being its bed. Thus the leather will preserve its proper shape. No sharp corner is produced, and therefore the leathers wear gradual and evenly, in place of splitting or tearing.

So far I have spoken of joints suitable for pressures, as pumps, presses and accumulators. In each of these cases, a sliding motion through the joints, in pipes, etc., where there is no such motiou to be provided for. These joints are usually made by screwing up discs of leather or lead between the glands or flanges. The surfaces should have slight grooves turned in them; small lengths of copper or brass tubes can be inserted where the joints are likely to be forced into the pipe. In all cases when long lengths of pipes are used, expansive joints should be employed. These joints should be constructed on the French plan, with flanges held together by bolts, etc. Between the flanges thick rubber ahould be placed to allow of expanaion and contraction of the pipes.

These joints should be made water tight by a cup leather (on the apigot and filled inside the faucet) after this construction as shown in Fig. 5. The ring of metal *Y* may, when numbera of them have to be made, be produced by a pair of tools in a press, a aoft metal being aufficient for the purpose. *R R* are rubber washera, and *S* a loose flange. It will be seen that the rubber between the spigot and faucet allow for any compreasion on the joints, while the other ruhbers allow any stretching action. These joints are easily made, as they are simple lathe work, and where any quantity is required, they can be very rapidly bored and turned with special tools. No trouble will occur with a series of joints properly relieved in thia manuer. I have here indioated, in detail, a correct method of constructing hydraulio joints. Nothing here specified is at all superfluous if a good job ia to be made.

The May receipts from the Raymond & Ely mine amounted to $10,836 per day.

San Francisco Stock and Exchange Board.

Thursday, June 6.

The sales at the Stock Board for the week ending 29th ult., amounted to $3,142,600. The sum of $120,000 was received from the Meadow Valley mine for the month of May. The Eureka Consolidated Company crushed 1,200 tons of ore last month, and have 830 tons ready for the mills. The Pioche mine turned out 100 tons of ore averaging $224 per ton. The bullion shipment on the 31st ult. was $11,-062. The Crown Point mine turned out, last week, 2,200 tons of ore, valued at $75,000; the Chollar Potosi, 1,000 tons, assaying $39.20; the Buckeye mine, 155 tons, assaying from $22 to $204 per ton; the Savage, 1,300 tons, assaying $27.91; and the Hale & Norcross 400 tons, with 1,900 tons on the dnmp. The Kentuck crushed 1,300 tons of ore averaging $23 per ton. The dividend of the Raymoud & Ely mine for June—$7 per share—aggregates $210,-000. The Belcher dividend for this month, of $30, amounts to $312,000. The Crown Point dividend of $3, aggregstes $300,000. This reduction is due to the interruption of work in the mines hy water.

Stocks have heen rather depressed this week. On Friday the demand was very quiet, and prices were low. On Saturday they were again heavy and sll descriptions were lower. Monday prices were lower than they have been for some time, snd business at the Board was very light. Tucsday there was a still farther decline, and evidently tonched hottom, for that afternoon and Wednesday there was considerahle advance snd more business. To-day the market was still better and most everything showed au advance.

Comparative Prices—Extremes, Advance and Decline.—S. F. Stock and Ex. Board.

California Cauliflowers. — Four cases of cauliflowers, through in seven days from the stalks, were recently received in New York from Sacramento, California. The cases were packed each with eight dozen head, wrapped in paper, and the freight alone of the consignment amounted to $68. This is the first lot of California cauliflowars received in eastern cities, and was sent as a sample to ascertain whether purchasers could be obtained and a market established for these and similar early vegetables.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

Favorable Weather.

The last three weeks have beeu most favorable for the grain crops of the State. But one day, of north wind has been experienced in that time and the weather has heeu uninterruptedly cool and favorable. The result will be that millions of bushels of grain will he gathered in the State more than would have heen with a continuance of the weather we experienced during the previeus period of three weeks. The rsin of lsst week, while it did but very little dsmage to the hay that had been cut, for the resson that it was followed with a day or two of cloudy weather, will prove of immense valne to the grain crops, and if we are favored with a continuance of like favorable weather for a week or two longer the wheat and harley crep of 1872 will be the largest and best ever harvested in the State and will place our farmers in easy circumstances generslly.

Increasing.—Travel to the Yosemite is steadily on the increase, and the probability ia that, with the improved traveling facilities afforded thia year over any previons one, more people will visitthis famous reaort thia season than at any time since it became a place of publio resort. The Merced river is higher at present than has ever been known at this season of the year, and those who wish to see the falla in their greatest grandeur should not defer their visit much longer, as when the river becomea low the valley is less attractive. *People.*

Ice Machines.—Messrs. G. & J., of Hot Creek, Nevada, are informed that there are no ice-making machines in use, made or sold in San Francisco; nor do we know of any we can recommend. Ice-making, like sugar from heets, requires extensive and costly machinery to manufacture the article profitably.

The Eberhardt and Aurora.

It is unfortunate that such a difference of opinion should have arisen in the management of this mine, as has existed for the past few months. The retirement of Mr. Ridsdale from the position of Chairman of the Board of Directors, was no doubt, a serious misfortune—as is freely admitted on all sides—and it is, perhaps, equally unfortunate that such a persistent controversy, should be kept up, as has existed since that gentlemans' retirement. While we have no disposition to take any part in this unhappy difference, we have thought it might be interesting and instructive to many of our readers to peruse the following letter from Mr. Ridsdale, written for private circulation among the stockholders, but, which has found its way into the columns of the London *Mining World*. In his preliminary remarks, Mr. R. observes:—

"When I left your board, the proportion of silver extracted at your mills from the crushed ore, or pulp, was only 65 per cent. of the assay value of that pulp, the percentage having gradually fallen from 85 per cent, (which was obtained under Mr. George Atwood's management), to that low and disastrous figure; and as the extraction of the bullion is of far more importance than the mere indication of its existence by the pulp assays, because if it is not got out you get no dividend, I purpose to examine the process pursued at your International Mill in detail; then to examine that pursued at the Stanford Mill, compare the two, and make sundry suggestions therefrom for the better extraction of your bullion for the future. I will begin with the ore after it has been crushed in the battery, and passed through the sieves when it is termed pulp."

Process at International Mill.

About 2,300 lbs. of pulp, with water enough added to keep it in a tolerably thick condition, is charged into each pan; one per cent. of salt, or about 25 lbs., is then added, with two ounces of sulphuric acid and from one-half to one pound weight of sulphate of copper. (The temperature of the pulp should be about 160 deg. Fah.; this is maintained by the introduction of steam into the false bottoms underneath the pans). The mullers are kept down and the pans grind for three hours; at the end of this time about 150 to 200 lbs. of mercury are added; grinding goes on then for three hours longer; the mullers are then raised and about 2 lbs. of carbonate of soda, for "cleaning" the mercury, added; amalgamation goes on for two hours; the contents of the pans are then run off into the settlers, and left to settle for about three-quarters of an hour; the settlers are then filled with water, and let cool down, before running off, when at the proper temperature, the plugs are pulled and run off, a stream of cold water being introduced all the time. The pans run eight hours; settlers four. The pans run at about sixty revolutions a minute; settlers at ten. The tailings after leaving settlers pass into agitators and from thence to the reservoirs. About 60 per cent. of the ore treated contains its silver in the state of chloride, the remaining silver existing in state of sulphide, or in combination with base metal ores; the gangue being quartz, largely mixed with carbonate lime.

The reasons given for the addition of these chemicals are as follows: Oxyde manganese being present in the ore, the addition of sulphuric acid acting on it and the salt introduced, evolves free chlorine, which helps to chloridize the base metals present. Sulphate of iron is also produced by the solution in this acid of the iron from the shoes and dies of the pan, and also by that coming from the wearing of the shoes and dies of the battery, whilst crushing the ore. The sulphate of iron thus produced with the sulphate of copper added, forms "magistral." The action of the salt on this "magistral," as in the Mexican "patio" process, producing the chlorides of both copper and iron which further chloridizes the silver existing with the base metals. This chloride of silver, together with that previously existing, is reduced to the metallic state by the iron of the pan, and then amalgamates with the mercury. The carbonate of soda added merely cleans the mercury.

Now it is very doubtful whether, even if these reasons are sound, this process is the best that could be desired for the treatment of our ores; for it is clear, that on the addition of sulphuric acid, by far the greater part must be converted at once into sulphate of lime, from the presence of large quantities of carbonate of lime in the ore, and the sulphate of copper would be at once reduced by the iron of the pans; the liberated copper thus formiug an amalgam with the mercury, and finally passing into the bullion.

In the "patio" process considerable time is allowed for the action of the sulphate of copper and salt on each other, so as effectually to chloridize the sulphide of silver and other base silver ores before the addition of any mercury, and there is no substance present before the addition of mercury which can act as a reducing agent and liberate the copper. This chemical, therefore, has a fair chance for operating, which it cannot have in the pan process. The addition of carbonate of soda to "clean" the mercury, so far as experience of its use in gold miling and amalgamating has afforded, is of very doubtful advantage at all. Cyanide of potassium is the best chemical for sharpeuing the affinity of the mercury for amalgamation, where sodium-amalgam is not used; and nothing is more important in miling than that the mercury should be clean and lively.

Many practical mill men cousider that if efficient pans be driven at good speed, the pulp being properly heated by steam, the action of the iron of the pan, in the presence of the salt, with clean, lively mercury, through circulation of the pulp being ensured, will compete successfully with any one of the chemical receipts. It is alleged that the heat and friction, in presence of the iron of the pans, salt, and mercury, give rise to an electro-galvanic action, which has a good deal to do with the decomposition of silver minerals. If so, by fixing strips of zinc on the wooden sides of the pans, a galvanic battery would be formed, which would much increase this action; whether this is the case or not, it would cost but little to try it. It is probably on account of this action that many metallurgists consider zinc-amalgam to be very superior to mercury in its amalgamating powers.

The Stanford Mill Process

Is far more efficacious than the one followed at the International Mill (the pans are smaller). Charge, 1,600 to 1,800 lbs. of pulp, half per cent. of salt, and about a quarter pound of cyanide potassium to the ton. Grind for 4½ hours, then add to each pan 200 lbs. mercury, grind for 1½ hours longer; raise mullers and amalmagate two hours. About one hour before running off pan into settler, add some perfectly clean lively mercury, so as to collect together the "floured" mercury. Whilst running off settler, a stream of cold water is allowed to flow into it. The coarse sand, etc., is shovelled out of the settlers and worked over in pans every 48 hours. Now the advantages of this process are, that the cyanide of potassium entirely does away with the use of acid, sulphate of copper, and carbonate of soda, whilst the mercury is kept in much better condition, and the out-turn of silver is larger.

In August last, the Stanford Mill crushed our ore, guaranteed us 85 per cent. of the assay value of the pulp, charged 15 dollars for milling, and made a handsomne profit; our sheets, so far as they are reliable (for the figures never agree), showed only 65 per cent. of the assay value of the ore as having been realized in bullion, at the time I left the Board. With rich ore, defects of management are not so vital in affecting the interests of a company as when you have to treat ore of a low grade. Then defective management frequently leads to irretrievable ruin. On a comparison made between the two mills when running on the same quality of ore, assaying 38 dollars to the ton, the tailings at the International mill averaged 13 dollars per ton, whilst the tailings at the Stanford mill ranged between seven and eight.

Importance of Careful Mining.

Now every dollar per ton that goes away with the tailings of our mill represents a loss on the yearly amount of ore crushed of 2*l.* per cent. on the whole capital of the company, and therefore is so much lost for distribution as dividend. That is the way to look at it. One dollar per ton on 80 tons crushed per day for 330 days, supposing the mill to run so long, taking our capital as 265,000*l.*, is 5,300*l.* Supposing this difference to persist throughout the whole year, that I have shown to exist between the silver lost in the tailings of our mill, and that of the Stanford, when running on the same grade of ore, that difference of 5 dollars between eight and thirteen, represents a differential loss of over 26,000*l.* per annum, or ten per cent. on the whole capital of the company, that would otherwise be available for dividend! a rather heavy price to pay per annum for want of adequate scientific supervision in our mill.

Are shareholders content that this is to go on? It is little use paring down wages or economizing trumpery petty expenses, such as those reported at the last meetiug to have been effected, when from want of proper scientific supervision, your property is subject to such gigantic drains as I have indicated. Your manager goes on month after month running your Oasis Mill upon "tailings." (*Vide* last report for January.) It costs at least five dollars a ton to work tailings at all, and you ought never to have tailings that pay you to re-work; you would not have were your amalgamation properly conducted.

The late Board of Management, at my instance, sent out a competent metallurgist to supply the place of Mr. George Atwood (who possessed the requisite metallurgical skill, but whose services are now unfortunately lost to us), Mr. R. J. Frecheville, of the Royal School of Mines. It is to this gentleman that I am indebted for the only accurate and reliable scientific information respecting our property that has yet reached this side of the water. Mr. Phillpotts has hitherto declined to avail himself of his services, not having been previously consulted in the appointment.

In Further Discussing the Subject of Milling,

I wish to observe that there is reason to believe that enough attention is not paid to keeping the mercury in a clean active condition, and the heavy sand that accumulates in the settlers and agitators does not appear to be shovelled out regularly and worked over in pans, as at the Stanford. This is professed to be attended to at our mill, but I have reason to believe that it is not done regularly; indeed, some of our pans have been known to be running for a long time without grinding, and this was only found out at last by accident; nor is it clear that any attempts are made to save the large quantities of mercury that escape from the mill, ranging from ¾ to 1 lb. per ton. The average charge of our pans is 2,300 lbs.; time of treating, 8 hours; thus 3 charges are worked per day per pan.

Now, looking at the high assay value of the tailings, as before shown, it is a question whether the pans are not overloaded, and if a lesser quantity, say 1,800 lbs. per pan were used for 6 hours, four times a day, probably better results would be obtained than from the larger charges run 8 hours 3 times per day. There is, however, in the International Mill scarcely pan power sufficient for the large number of stamps. The excellent practice pursued at the Stanford Mill, of adding clean lively mercury to the pans just before running off, is not followed at the International. There is another point connected with the question of

The Enormous Loss of Mercury

At our mill, to which I desire to direct attention. The amalgam, after being cleaned and strained, is retorted; the mercury which distils off is led through a pipe, kept cold by water circulating round it, into a receiver containiug water, and thus condensed to the metallic state, so as to be again available for use at the mill. The crude bullion produced generally amounts to one-fifth or one-sixth of the amalgam operated upon; this crude bullion is then taken to the assay office and melted into bars. Of course as it always unavoidably contains more or less quicksilver and foreign matters, there is necessarily a discrepancy between the weight of the crude bullion and the weight of the bars produced from it; but the discrepancy at our mill is far larger than it should be, and this is owing to imperfect retorting.

In one of the largest miuing companies on the Comstock lode, I find that this loss averaged only 1 68-100 per cent. for the year; our loss is frequently 10 per cent., and it has in an extreme case even reached 26 per cent. Now, the great bulk of this loss is mercury, and mercury costs 90 cents per pound. The whole figures in detail are before me. If the retorted silver was melted in pots with alembic heads, a great part of this loss in mercury might be avoided. There are a number of other minor metallurgical details that require careful attentiou in this department.

The mines belonging to this company, particularly the North Aurora, appear to have fully borne out all that the experts (employed at the time of the sale of these mines,) reported of them. The largest and richest deposits of ore, run close up to the north line of the South Aurora, which claim is on that portion of the vein lying between the Eberhardt and North Aurora mines.

Whatever may have been the fault in the Eberhardt Co's management, indeed if any, it contrasts very favorably when compared with that of the South Aurora. Where they have wasted vast sums of money in useless out-door work, and neglected to develop and follow their rich ore deposits, thereby bringing discredit on the district.

By refereuce to the files of the *White Pine News*, also to our summary of last week, it will be seen that the developments all the way on the line of the "Treasure Hill Vein," from the Hidden Treasure to the Eberhardt, are of the most encouraging and satisfactory character.

The Emerald Mines of Muzo.

The mountains of Muzo, New Grenada, says the *Jour. Soc. Arts*, like those of the whole central Cordillera of the Andes, belong to the lower formation of chalk. In the mines now worked, the emeralds occur in two distinct layers,—the first, or upper one composed of a bitumen which is black and friable; the second, lower down, also of calcareous bitumen, but hard and compact. These two layers are generally separated from each other from 17 to 22 yards. In the upper layer, the emerald occurs in nests, in the lower, in what approaches nearer to veins. Nests of emeralds are seldom found in the latter, but the gem is more easily extracted. The presence of well crystallized fluorspar denotes proximity to the emerald, and the occurrence of rock crystal or parisite is also a good sign.

The mine of Muzo is worked both by galleries and in the open air, the latter method, although more expensive, being preferable on account of the greater ease of finding the emeralds. All the gems now extracted are sent to Paris to be cut. The annual production is not made public.

There are indications that the mountains of Muzo are rich in emeralds, and it is thought that the stores of this precious stone have hardly been touched. But in 1864, the Columbia Government in return for an annual payment of $14,700, granted to a French company a lease of the mines at Muzo for ten years, together with a monopoly of all emeralds in Columbia, binding itself to prohibit the working of any other mines in the Union. This lease, which expires in 1874, will probably not be renewed.

Evidently the mines of Muzo were known long before the discovery of America. The Spaniards in 1553 found the Indians in possession of a large quantity of the stones. After the arrival of the Spaniards the mines were extensively worked, but, for some unknown reason, were abandoned about the middle of the 18th century. After the War of Indepeudence, the Republic took possession of the mines and let them out to individuals and to companies.

Increasing the Vigor of Growth in Plants.

A very important announcement has lately been made in France as to the effect produced upon the luxuriance of vegetation by the disturbance of the natural position of the branches. It has been known for some time that if two branches of a fruit-tree be selected of about the same size, and the same upward inclination to the horizontal plane, and one of these be bent downward toward this plane, it appears to lose its vigor, while the other gains in a like ratio. It is now announced as the discovery of an ignorant peasant on the Dauuhe, named Hooibreuk, that this law holds good only up to the horizontal position; and that if the branch is depressed still further, and below the horizontal, it becomes characterized by much greater vigor than before, and, in fact, will put out leaves and branches to an astonishiug and unheard-of degree. But this depends upon keeping the branches as nearly as possible in a straight line, the effect being measurably lost with a considerable curvature. In this case, only the buds which occupy the top of the arc are developed completely, at the expense of the rest, which remain in their original condition, contributing neither to the extension of foliage nor of fruit.

Duchesne Toureace, in communicating these facts to *Les Mondes* attempts to show the causes which seem to determine so great a flow of sap to the brauches inclined below the horizontal line, and thinks that the explanation is to be found in the establishment of a siphon arrangement, by means of which the juice is carried over the bend from the main stem in excessive flow. Be this as it may, the fact remains, as illustrated by an experiment prosecuted by this gentleman. In early spring, when the sap was ruuuiug in the vines, he took four plants of about the samo size, and trimmed them so as to leave one stem to each, these beiug arranged vertically, obliquely upward; horizontally and obliquely downward. He then cut off the stems, and collected aud measured what exuded, and found the amount from the branch inclined downward was more than three times greater than that from the others.

Something About Wool.

The San Joaquin Valley *Argus* complains of the want of discrimination exhibited by purchasers of wool, and says: "The great desideratum seems to be quantity—quality being of comparatively little or no importance. An apt illustration of this point was furnished last year in the case above referred to. The party in question had 2,300 yearlings, the fleece from which was considered next to worthless, being short and exceedingly foul—the owner estimating at least one pound of dirt to every five pounds of wool. It was baled separately, and with many misgivings as to the result forwarded to market, a full statement of the case being made to the commission merchant to whom it was consigued. It was sold at 29½ cents per pound, while the fleece from the older sheep, which was long and silky, and almost entirely free from dirt—with which extra care had been exercised in shearing, baling, etc.,—brought in the same market 31½ cents—a difference of only *two cents per pound* in favor of the finer quality. This being the case, what encouragement is there for the wool-grower to improve the grade of his sheep, or to exercise more than ordinary diligence in the preparation of his wool for market? Cotswolds and Southdowns to the dogs—give us scrubs! The more dirt the more money, seems to be the rule; and as the benefits of any system are to be judged by the practical results, we conclude that all efforts to improve the grade of sheep by crossing stock, etc., must necessarily prove futile, and the time spent therein worst than wasted. Money is what the producer is after—the largest return for a given amouut of labor. Let him, therefore, cease his efforts at improvement, and turn his attention to scrubs and dirt. The latter will pay—the former won't—and that's 'what we know about wool.'"

California Butter vs. Eastern Butter.

From the tone of the Eastern Press we find that California is in a fair way of securing better prices for butter than Eastern States do for their own production. A reliable exchange says:

"The highest color is all that is sought for by both the local and shipping trade, and prices for such are consequently well sustained, selling at 30@31c., whereas the other grades mentioned are difficult to dispose of at prices varying from 20@26c. There is some increase in the receipts of Ohio, with a slight improvement in quality, but the greater portion of it is yet very poor stuff indeed, and despite the very best efforts of receivers to clear their houses of it, it is too inferior for the market men, and there is no other trade to carry it off. The reports from New Orleans are not flattering for extreme prices for butter this season, and shippers, except on orders, are buying but sparingly. The result of this will be a gradual weakening of prices, not so much, however, as to deter the Western Reserve from forwarding what is needed".

The car load of California butter shipped to the East a few days since, is receiving marked compliments from the Atlantic papers; they pronounce upon it in Boston "as perfectly delicious." If eastern butter is in such disfavor as the above remarks seem to indicate, our shipments will command excellent prices, for we send a good article, which is fully appreciated.

Useful Information.

Education of the Eye.

How few there are that appreciate that optical marvel the eye! How few understand its mechanism, the principle on which it acts and the wonders which it accomplishes! As an avenue by which external impressions find their way to the mind, it is worth all the others man possesses. So gradually is its skill acquired that we hardly recognize it is acquired skill. We educate, through long and systematic practice, hands, feet and muscles; but in the main the eye is left to itself, to acquire as it may its power of estimating distance and size, color and the definition of form.

In this desultory way it acquires a skill beyond expression wonderful; yet we believe that with most the power of visou is only imperfectly developed. What is to hinder systematic discipline of the eye any more than of any other organ. To be able to see correctly is of as much importance to the mechanic as to the artist. Mr. Ruskin, in his admirable treatise on the "Elements of Drawing," lays particular stress upon teaching the eye to see correctly, and shows that the hand will have but little difficulty in learning to represent what is accurately seen.

The mechanic is often called upon to make forms for which his unaided eye must be the principal guide. The wagon maker may lay out his work by patterns, but the ornamental finish principally depends upon the nicety with which the eye can trace lines of grace and beauty. Even in shaping a boot sole there is great skill of eye. If any one doubts this let him try to shape a sole to the outlines of his own foot, and see what an uncouth, ungainly form he will make. None but novices will try the experiment, for any one who has tried it knows the difficulty in combining comfort and beauty in a boot sole. Shoemakers have been much denounced for their failures in this respect, but the reader may rest assured that their art is a difficult one. They cannot go by plumb line, square and level, like the mason or the carpenter, and no one who has ever tried to draw a sole pattern knows how slight variations will affect, favorably or unfavorably, its appearance. The cabinet maker, the carver, the sign painter, the decorator, all of these attain skill principally through the education of the eye.

The impressions gained through this organ may be placed under the categories of distance, size, light and shade, form and color. It is through the power to appreciate distance that we form our first estimates of size; then we begin to distinguish light and shade, and thus to gain power to define form, and lastly we distinguish, more or less perfectly, colors and tints.

A most profitable system of exercises might be devised by an ingenious teacher, calculated to train the eye in the exercises of its various functions in early youth, and to form correct habits of vison; for he who supposes the eye is not influenced by habit as well as any other organ makes a serious mistake.

The worst habit of all is the habit of partial sight. Instead of closely scrutinizing everything they see, the majority of men only superficially look at objects as they pass before them. They thus become inaccurate witnesses in court, inaccurate in their impressions of material objects in general, and fail when they attempt to imitate, because the images they strive to produce are imperfect.

If in early youth children were taught to look carefully at everything, and to constantly test the accuracy of the preceptions thus obtained, we believe the habit of close observation thus acquired would be of greater advantage than the result of any other mode of discipline now practised in elementary schools.—*Ex.*

Difference of Hydraulic and Common Lime.—Most dealers in common lime sell also hydraulic mortar. It is not sold in lumps like common lime, as it can not be used so; it does not slake and fall to powder like common lime, but must be ground in a mill, like plaster of Paris; it is, therefore, only sold in powdered form, packed in barrels. In that condition it looks very different from common lime, as it is not white but gray or brownish, and feels more gritty than pure lime, which feels even fatty when moist. We never needed any other test; but if a chemical test be required, we should advise hydrochloric acid, (muriatic acid,) which dissolves common lime entirely without leaving a remnant, while it will not attack the silicates of the hydraulic mortar. But as a practical test which at the same time determines the value of the hydraulic mortar, it is best to tie different samples up in small stiff linen bags, and throw them in water, let them lay and examine from time to time their increasing hardness. That which sets the quickest will not be the hardest in the end, but the purpose for which it is intended must settle the choice of the kind of cement to be used.

Brown Tint for Iron and Steel.—Dissolve, in four parts of water, two parts of crystallized chloride of iron, two parts of chloride of antimony and one part of gallic acid, and apply the solution with a sponge or cloth to the article, and dry it in the air. Repeat this any number of times, according to the depth of color which it is desired to produce. Wash with water and dry, and finally rub the articles over with boiled linseed oil. The metal thus receives a brown tint and resists moisture. The chloride of antimony should be as little acid as possible.

The Preparations of Fancy Soaps.

Fancy soaps, which are made in great variety for the toilet, are usually scented with some aromatic oils. For this branch of the trade the ordinary commercial soaps are used, after undergoing a process of refinement, or a soap is specially made for the purpose from almond oil, or the like. Much taste is shown by the best London makers in the selection and combination of the perfumes, which, along with the coloring matter, such as vermillion, yellow ochre, aniline, etc., are usually boiled up with the soap. To facilitate this operation, as well-dried soap does not readily melt, it is usually cut up into fine shavings, and after boiling is well worked under the rollers until it presents a uniform appearance. If the soap is intended to be highly scented, or very extensive perfumes are to be employed, the cold process is adopted, as much of the strength of the scent is lost by boiling. In this case the soap is shredded as before, and the perfume and coloring matters well amalgamated with it by being worked in a mortar with a pestle. It is then divided into lumps, and roughly moulded with the hand into something of the shape it is finally to assume. After being left on a rack to dry for about a week, it is pressed into a mould, which imparts to the cake the form and device which may be required, and when taken out the edges are trimmed and the surface polished with the hand. *Cassell's Technical Educator.*

The Age of Oysters.—An old oysterman can tell the ages of his bivalves with great precision. Those who are familiar with an oyster shell must have observed that it seemed composed of successive layers or platss overlapping each other. These are technically termed "shoots," and each of them make a year's growth, so that by counting them he can determine at a glance the year when the creature came into the world. Up to the epoch of its maturity, from five to seven years old, when they are in perfection, the shoots are regular and successive; but after that time they become irregular, and are one over the other, so that the shell becomes more thickened and bulky. Among fossil oysters, specimens are found occasionally of enormous thickness, and the amount of time that has passed between the deposition of the bed of rock, in which such an example occurs, and that which overlies it, might be calculated from those observations of the shape and number of layers of calcareous matter composing an extinct oyster shell. In some ancient formations, the above stratum of extinguished oysters may be seen, each bed consisting of full grown and aged individuals. Judging from the greatness to which some oyster shells have attained, this mollusk is capable, if left to its natural changes and unmolested, of attaining a patriarchal longevity.

Solder Wire, so very convenient for some work, may be made as follows: Take a sheet of stiff writing or drawing paper, and roll it in a conical form, rather broad in comparison with its length. Make a ring of stiff wire, to hold it in, attaching a suitable handle to the ring. The point of the cone may first of all be cut off, to leave an orifice of the size required. When filled with molten solder it should be held above a pail of cold water and the streams of solder flowing from the cone will congeal as it runs, and form the wire. If held a little higher, so that the stream of solder breaks into drops, before striking the water, it will form handy, elongated "tears" of metal; but, by holding it still higher, each drop forms a thin concave cup or shell, and, as each of these forms have their own peculiar uses in business, many a mechanic will find these hints very useful.

Gimlet Pointed Screws.—Most mechanics who work in wood do not appear to understand the eminent superiority of wood screws over brads and nails. In many places, one screw is worth three or four nails. When one is securing cleats to batten doors, or cleats to a wagon box, nails are very unsuitable when compared with the efficiency of gimlet pointed screws. Screws will hold two pieces of wood more rigidly than nails; and, if the timber should shrink a trifle, the screws can be turned up tight; whereas it is difficult, in most instances, to tighten up loose work with nails. Screws should be used in preference to nails in all places where there is an unusual strain on the parts to be held together.—*Ex.*

Waterproof Leather.—An ingenious patent is now being worked, by which leather for the soles of boots and shoes is rendered impervious to wet and damp by exhausting the air from the pores of the leather, and filling them up with a substance which unites with and adheres to the fibre, thereby strengthening without impairing the elasticity of the material. It is stated that the patent, known as "Fanshaw's Waterproof Leather," is not only likely to be largely employed for the purpose to which we have referred, but when asphalt pavement becomes more general, it will be possible to shoe horses with a material as hard as the asphalt itself, and which will prevent them slipping.

Restoring Charred Writing.—The restoration of the writing on manuscripts charred by fire may, it is said, be accomplished by separating the charred paper into single leaves, immersing them in a solution of nitrate of silver (forty grains to the ounce of water). The operation is to be conducted in a dark room, and when the writing is sufficiently legible the excess of silver solution should be washed out with distilled water and dilute solution of hyposulphite of soda.—*Am. Artisan.*

Good Health.

Adulteration of Drink.—We (*Lancet*) referred cursorily last week to the adulteration of drink by brewers or publicans, and we would once more call attention to the extent and magnitude of the evil. We fancy it is far more due to the effect of adulteration by narcotics in increasing drinking than to increased cheapness of production, or any other ordinary cause. The object with which it is done appears to be that the working man, who sits down to refresh himself with a half-pint, or pint, shall at once become sufficiently muddled to lose his self-control, and to call for more and more in excess of his originally prudent and proper intention. A business that poisons men for the sake of plundering them is simply a public nuisance, and even if other kinds of adulteration are for a time left unpunished, no leniency should be shown to this. It is difficult to say by whom the noxious ingredients are most frequently added. In any enactment on the subject, care should be taken that publicans are not made scape-goats for more wealthy sinners. Between them, the lot of the poor man, who depends upon a beer-shop for refreshment, is hard indeed. If he go there, the chances are that he is drugged into drunkenness, when he wishes only to quench his thirst; and if he drink water, he incurs risks of poisoning by sewage, which are not to be lightly regarded.

Evidences of Illness.—Pain and fever are not the only evidences of sickness. It is quite possible to have a tolerably regular pulse, a fair appetite, and even to sleep six or eight hours out of the twenty-four, and yet be far from well. In spite of these favorable indications, the body may waste away, and the nervous energy of the system rapidly decline. Emaciation, languor, and depression of spirits, although they may not be the symptoms of any specific disease, are infallible signs that the life power of the frame is deteriorating, that the mainsprings of vitality are losing their elasticity. If no help be given to nature in this emergency, a collapse of the vital machinery will finally ensue, and a life that might probably have been extended to the full scriptural span of three score years and ten, will be prematurely brought to a close. Thousands of such cases occur every year. Physicians call this running down of the animal machinery, atrophy, marasmus, nervous debility., etc., and it is often mistaken for pulmonary consumption. It arises, however, simply from a lack of constitutional energy, and a corresponding torpidity of the reproductive principle upon the vigor and activity of which the nourishment and repair of the whole organization depend.

Growing Men.—Dr. W. Holmes has shown what every body knows, that we are, as a race, deteriorating. But he has not given us the reason why the New England man grows smaller in bone and muscle. Chemistry tells us it is owing to the want of mineral in the soil to produce bones. Much is owing to our unnatural habits of life. Much to the weakness of our female sex, who do anything but develop their muscular powers. But the main reason why the race deteriorate so rapidly in the eastern part of New England, is owing to the hard granite soil, which does not furnish limestone sufficient to form the bones. In Kentucky, Ohio and Western Vermont, men grew to large size because of the limestone formation beneath the soil. Parts of families have emigrated from Massachusetts to limestone regions, and the result in the next generation, has been a larger bone development in those who left Massachusetts than those who remained. Kentucky, Ohio and Iowa will grow great men. The finest figures in the world will be found in the valley of the Mississippi in a few generations. Indoor labor, so unnatural for men, will weaken the vital powers and stop the growth in large cities, but the great and glorious West, with its broad prairies, will compensate for the growing feebleness of the Eastern States.

Use of Lemons.—When persons are feverish and thirsty beyond what is natural, indicated in some cases by a metallic taste in the mouth, especially after drinking water, or by a whitish appearance of the greater part of the surface of the tongue, one of the best "coolers" is to take a lemon, cut off the top, sprinkle over it some loaf sugar, working it down into the lemon with a spoon, and then suck it slowly, squeezing the lemon, and adding more sugar, as the acidity increases from being brought up from a lower point. Invalids with feverishness may take two or three lemons a day in this manner, with the most marked benefit, manifested by a sense of coolness, comfort, and invigoration. A lemon or two thus taken at "teatime," is an entire substitute for the ordinary supper of summer, and would give many a man a comfortable night's sleep, and an appetite for breakfast, to which they are strangers, who will have their cup of tea, or supper of "relish" and "cake," and berries, and peaches and cream.—*Hall's Journal of Health.*

Railway Air-Cushions.—A writer to the *Medical Times* refers to the fatigue of the limbs produced after a long railway journey as due mainly to the trembling motion of the floor under the feet, and states that, having suffered considerably from this abuse, he was induced to try the experiment of using the well known air cushion as a footstool. This answered so well that he has never travelled without using one in this way, and has found the effect to be a remarkable improvement.

A Simple and Effective Remedy for Corns.—When a young man, I used to be very much annoyed by those painful excrescences called "corns," on the toes and feet, until I was told of a very simple, but effectual remedy for them, by some person. It was to bathe the feet in tepid water, to soften them; then pare them off very closely with a sharp knife; then rub on well, green peach tree leaves; when, after continuing the rubbing once or twice a day, the corns will entirely disappear, and not return, without the cause which first occasioned them. I have often tried the remedy, and never found it to fail yet. It seems to be the prussic acid in the peach tree leaves that takes them away.

A good corn salve could no doubt be made for winter use, by bruising the peach leaves when green, then boil them in water until the strength is extracted; then take out the leaves; strain the water off the sediment, and add a sufficient quantity of resin, beeswax, tallow and lard oil to make it soft enough, and simmer down, without burning, until the water is evaporated. Soften and pare the corn, as before directed, spread it on a small piece of cambric or linen, and apply, putting on the sock or stocking carefully, so as not to rub it off. Keep applying until they disappear.—*Country Gentleman.*

If a woman's dress is suddenly enveloped in flames, instead of running to her, or out of the house, speak distinctly and commandingly: "Lie down and roll over!" Meanwhile, rip up the carpet, or drag off a bed blanket, throw it over the person, and then proceed to wrap her up closely in it; this is a more certain and speedy extinguisher than water, is more accessible, and entirely safe to the person giving aid.

If a woman faints away, instead of yelling out like a savage, or running to lift her up, lay her at full length on her back on the floor, loosen the clothing, push the crowd away, so as to allow the air to reach her, and let her alone. Dashing water over a person in a simple fainting-fit is a barbarity, and soils the clothing unnecessarily. The philosophy of a fainting-fit is, the heart fails to send the proper supply of blood to the brain; if the person is erect, the blood has to be thrown up hill, but if lying down, it has to be projected horizontally—which requires less power, is apparent.

Explosive Pills.—Some pills prescribed by a physician in London contained one-half grain nitrate of silver, one-sixth grain extract nux vomica, and one-half grain muriate of morphine, together with *Cons. ros.* and extract of gentian. They exploded in a very short time, evolving a considerable amount of heat. A similar case occurred in the practice of Dr. Jackson, of Nottingham, England, who prescribed pills containing four grains nitrate of silver, one grain muriate of morphia and extract gentian. The lady patient, who had the box about her person, was badly burned by the explosion. Pills containing nitrate of silver and creosote or carbolic acid become heated, and even take fire. Of course, when chlorate of potash is employed the explosion is much more violent.

Evening and Night Air.—From the time when the sun withdraws his light in the evening, until he scatters the fogs and mists of night with his morning beams, the air is in a condition much less congenial to health than during the day. Light itself is an invigorating element, and darkness has a depressing effect upon the body as well as the mind. Moreover, from the hour when the dew begins to fall or rise—we know not which—until the East is brightened and warmed by the morning rays, the atmosphere contains a smaller proportion of oxygen, or vital air, than when the sun shines.

For Offensive Breath.—For removing this disagreeable affection almost the only safe and effective thing to use is the concentrated solution of chloride of soda. From six to ten drops of it in a wineglass full of pure spring water, taken immediately after the operations of the morning are completed. In some cases the odor arising from carious teeth is combined with that of the stomach. If the mouth be well rinsed with a teaspoonful of the solution of the chloride in a tumbler of water, the bad odor of the teeth will be removed.

Cool Rooms.—Open all the windows and doors at daylight, and let them remain open at least until sunrise, then close them, and darken the windows, and they will remain delightfully cool and fresh for a great part of the day, besides keeping out the dust and flies; for want of this precaution many splendid parlors have a close sickening smell as you enter them, wholly incapacitating you from enjoying the beautiful things around you, and enjoying the visit to your friends.

When Beginning To Use Glasses, use them as short a time as possible, only in deficient light, or on minute objects, and then change the strain to distant or larger objects. By a judicious attention to these two points, the age of the sight will be retarded many years. And as reading is one of the luxuries of the age, and one of its most delightful pastimes and amusement, we can not be too careful of the eye-sight, and should study how we may best husband its powers.

Food forced upon the stomach in the absence of all appetite, can never properly nourish the system. Even when it is retained, it is never more than half digested, for the palate and the mucous membrane of the stomach are in sympathy with each other, and what the palate loathes, the gastric juice only imperfectly dissolves and assimilates.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3 00	7.50	20.00
One Inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Clubs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 8s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 8d. Large advertisements at special rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, June 5, 1872.—Legal Tenders buying, 88½; selling, 89¼. Gold in New York to-day, 114¾.

Table of Contents.

EDITORIALS.—Academy of Sciencee; Mining Suit; A New Style Pan; Miners' Festival, 360. About Patents; Mines, Mills and Furnaces of Pacific States and Territories; New Method of Prospecting; Convenient Table for Miners, 361.

ILLUSTRATIONS.—Hydraulic Joints, 353. Warner & Silsby Improved Bed Spring, 360.

CORRESPONDENCE.—Geology and Mining; San Diego Mines, 354.

SCIENTIFIC PROGRESS.—Extinguishing the Electric Light by the Approach of a Magnet; Ball Lightning; the Asteroids; Disappearance of a Star; Origin of Coal, 355.

MECHANICAL PROGRESS.—Weather Waste of Coal; Crystallization in Wrought Iron; Vitrified Marble; Boiler Explosions; Coal Cutting Machinery, 355.

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 356-7.

USEFUL INFORMATION.—Education of the Eye; Difference of Hydraulic and Common Lime; Brown Tint for Iron and Steel; The Preparation of Fancy Soaps; Gimlet Pointed Screws; Waterproof Leather, 359.

GOOD HEALTH.—Adulteration of Drinks; Evidences of Illness; Growing Men; Use of Lemons; A Simple and Effective Remedy for Corns; Explosive Pills; Cool Rooms, 359.

DOMESTIC ECONOMY.—New Mode of Washing; Economy in the Household; Convenient Arrangement of Houses; How to Cure Hams; Orange Chips; Selected Receipts, 363.

MISCELLANEOUS.—Deep Mines; Coos Bay Coal Measures; The Ava Watts District, 354. The Eberhardt and Aurora; The Emerald Mines of Muzo; Increasing the vigor of Growth in Plants; Something About Wool; California vs. Eastern Butter, 358. U. S. Centennial Commission; New Incorporations, 361.

POPULAR SCIENCE MONTHLY.— This publication fills a most urgent want in the magazine literature of the day, and promises to become immensely popular. Scientific matters are here treated in a familiar and popular manner by some of the most eminent scientists of the day. The magazine is issued in Appleton's best style, and bids fair to become immensely popular. The second number, which has just come to hand, amply fulfils the high promise of the first. It contains a large number of interesting articles, among which we notice one from Herbert Spencer on Social Science, continued from No. 1. Prof. Yeomens gives an interesting article on What is Known About Sun Spots. The Natural History of Man is continued from No. 1. One of the finest articles is by an anonymous writer on Darwinism and Divinity. Every article in the two numbers which have already appeared, are both timely and well written, and constitute the cream of the scientific literature of the day.

MINING BUREAU.—We have received the first number of the *Monthly Bulletin* of the Bureau of Mining Information for Utah. The *Bulletin* contains some useful facts concerning the furnaces and smelting works, stamp mills, mining districts, etc., of Utah Territory. This Bureau was organized in March, 1872, with Warren Hussey for President, Thos. P. Akers, Vice-President, Theo. F. Tracy, Treasurer, and E. M. Barnum as Actuary and Secretary. It proposes to give reliable information in regard to character, extent, development, etc., of mineral properties in the Territory.

Academy of Sciences.

An exceedingly interesting meeting of the Academy of Sciencee was held on the 5th, inst., Prof. Davideon in the Chair. The Committee appointed to draft resolutions of respect to the memory of F. L. A. Pioche, reported, and the resolution was accepted. A medallion of the deceased member was presented to the Society by P. Mezzara and was acknowledged with thanks. A number of donations to the cabinet were received.

The Proposed Arctic Expedition.

M. Pavy, the young Frenchman who is about to attempt to reach the Open Polar Sea by way of Bheringe Straits and Wrangell's Land, was introduced by Dr. Stout. He presented a letter from the American Geographical Society, of New York, commending him to the courtesy of Scientists all over the world. Prof. Davidson made a few remarks concerning the proposed expedition and invited M. Pavy to explain by means of the charts the manner and route by which he expects to reach the Pole, and give his theory concerning the currents, etc., of the region.

Mr. Pavy then addressed the Association on his proposed expedition, and gave them his views and reasons for attempting to reach the open sea seen by Morton and others, by the way of Bhering's Straits, instead of going by the other side. He said that the question of the passage from the Pacific to the Atlantic was an old one, and only interesting from a scientific point of view, since the passage would of course be useless for the purposes of commerce. He then referred to the various expeditions which have from time to time gone out to explore the polar regions, and said that all attempts to reach the.

Open Polar Sea

Had been from the Eastern side, and that since they had all failed he proposed to mark out a new course and make the attempt from this side. He gave many reasons why he thought he would be successful, and based the principle part of his reasoning on the direction of the currents. The Polar Sea, he thought, was not only open in the summer, but in the winter also. This fact has been demonstrated by deduction from the fact of wood being found at Spitzbergen which is known to have come originally from the Anadyr river, which empties on this coast. Prof. Davidson thought this no proof of it being open in winter since it might take a number of years in its passage. M. Pavy supposed that this wood must have been carried by a current which passes north through Behring's Straits.

He is confident that Wrangell's or Kelly's land extends much farther north than the present known limits, and that the course of the current referred to must be deflected by the continent toward the northwest where explorations have never been made. Passing Wrangell's Land this current in accordance with known laws, must deflect toward the East, pass through the Polar sea and south, into the Atlantic Ocean, in the vicinity of Spitzbergen, where the deposits of wood referred to are seen. This current on the other side runs south as experience has shown, and Dr. Hayes found it had a velocity of three and one half nautical miles per hour. This large amount of water coming from the north precludes the idea of much land in that direction. He thinks that the Gulf Stream sinks in the north at Spitzbergen when it comes in contact with the counter current from the Polar Sea, for known reasons.

The belt of ice which surrounds the Polar Sea, and which keeps out the ships of the explorers, Dr. Kane thought was about eighty years old. The current running south hinders the passage of vessels. The members of the Russian Expedition who thought last year that they had reached the Polar Sea have come to the conclusion that they were only in a "bight" in the ice which was created by the warm current of the Gulf Stream. M. Pavy thinks the Gulf Stream after sinking, as mentioned before, rises again and keeps the sea open when it becomes superficial. He proved the existence of this open sea from the facts of the birds and animals passing north instead of south, when the cold weather came; certain species of whale also go north and their breeding grounds are unknown. The open water to the north has been seen by Morton and others, and there is no doubt that it actually exists.

M. Pavy will leave here so as to reach Wrangell's Land by September 1st, and expects to occupy the time from then until May 1873 in crossing northward with sledges and dogs, carrying his india rubber raft, provisions, etc., and will launch his raft on the Open Polar sea, cross it and come down with the current on the other side. He will be on the sea in the summer and will return by Smith's Sound on the other side.

Professor Davidson

Differed from M. Pavy as to the direction of the currents, and is in doubt about a warm Polar Basin. He thought that the Gulf Stream flowed northward and rounding the Polar Sea flowed southward again through the straits into Baffin's Bay. He considered the latest European charts of the regions around Bhering's Straits very defective. The straits are 25 miles wide and about 30 fathoms deep, the current running from one and a half to three knots per hour and must therefore, from the narrowness and shallowness of the passage, be entirely inadequate to produce the effect which M. Pavy thinks it does. An animated discussion ensued between M. Pavy and Prof. Davidson on points connected with the direction and velocity of the currents which was very interesting, and proved that both gentlemen were thoroughly posted on the subject in question.

The Colorado Desert.

Col. Gray submitted to the Academy an extract from his report as Engineer of the Southern Pacific Railroad Co. Lieut. (now Col.) R. S Williamson in his report on explorations for a route for the Pacific Railroad refers to a line from San Gorgonio Pass to the San Diego and Fort Yuma wagon road. He says it was evident that the surface was below the level of the sea and that they were traveling in the bed of what was once a lake or the head of the Gulf of California; a water line being visible and the barometer indicating a depression nearly 100 feet below the tide level.

E. A. Phelps, assistant engineer under Col Gray has just completed a survey, of a branch line of the Southern Pacific R. R. via San Gorgonio Pass to Fort Yuma. He followed along the east side of the valley while Col. Williamson's route lay on the west side. Phelp's line on leaving the summit of San Gorgonio Pass was by an easy grade about 65 miles; then descending gradually 26 6-10 miles to a point on the stage road opposite Dry Lake, the lowest point but one on the line, being 203 feet

Below Tide Water Level.

Then with an undulating grade to Salt Creek, about six miles, the lowest point on the line, being 215 feet below tide level; then gradually ascending about twenty miles, where they rose to the sea level. The total length of the line below sea level is 50 6-10 miles. The bed of Dry Lake, opposite the stage road, is at least 100 feet lower than any other point on the line.

There is a distinct water line on the eastern slope of the mountains, coinciding with the sea level, as far as the eye can see south. The water line or ancient shore line is still more plainly visible on the mountains bordering the western side of the basin.

The Chorvilla Valley, lying within this basin and traversed by the line of the road, is covered with vegetation, sage brush, arrow-weed mesquite trees; the latter of which grow ten to thirty feet high and fifteen inches in diameter. Water can be found in the valley by digging from six to ten feet. Taking Williamson's report of the west side of the basin, and this report of the east side, proves conclusively that a large area of the Colorado Basin is below the sea level. Williamson's elevations were taken with the barometer, Phelp's by leveling from tide water of San Francisco Bay. The elevation of the Colorado river, at the crossing at Fort Yuma, was found to be about 117 feet above sea level, which coincides with Williamson's barometrical observations.

QUARTZ MINING IN NEW ZEALAND.—During the months of March and April, 14,997 tons of ore were crushed from 64 mines in New Zealand, which produced a yield of 27,388 ounces of gold, valued at $15 per ounce.

METEOROLOGICAL.—The monthly mean of the barometer in San Francisco during May was 29.986 inches. The monthly mean of the thermometer was 56.3°; and 0.18 inches of rain fell. The prevailing wind was southwest and the total number of miles it traveled was 8, 355.

MINING SUIT.—Charles F. McDermott brought suit in the Twelfth District Court, on the 5th inst., against the Raymond & Ely mine to recover 950-1350th part of the product of the mine for last year and for that proportion of the mine. The plaintiff alleges that he and others located the Panaca silver mine (now the Raymond & Ely) in August, 1862, in Meadow Valley District, and that in March, 1864, Thos. Box, Steven Sherwood, J. N. Vandernark and S. S. Shutt made a separate location adjoining the one before referred to. He claims to have come into possession of a part of the mine by certain conveyances. On March 1st, 1872, the defendants entered upon what is known as the "discovery claim" of the mine, which is claimed by the plaintiff, and commenced working the ground. He says that from May 1st, 1871, to June 1st, 1872, defendants have taken from said claim ores valued at $1, 500,000, and that he is entitled to a certain proportion of the profits since that by right of discovery and of conveyance a portion of the mine belongs to him. The plaintiff prays that defendants be compelled to pass over to him the proportion of profits stated above, and that a receiver be appointed to work the mine and deposit plaintiff's proportion of profits monthly, in some interest paying institution in this city to be paid on order of the Court to the plaintiff; and that he be let into possession of his proportion of the property.

A NEW STYLE PAN.—Ira S. Parke has recently planned and had made for him an amalgamating pan for working tailings. The Gold Hill *News* says that the principle of the pan is a correct one, and will doubtless prove a success. It is simply a huge double pan, being about twelve feet long by six feet wide. The bottom portion is of cast-iron, about a foot deep, and the wooden sides when completed will make it five feet higher, or six feet deep in all, calculated to work about twenty tons of tailings at a charge. The bottom portion alone weighs 7,500 pounds, independent of the cones, mullers, etc., and when the whole is ready for use it will be taken to Parke & Bowie's tailings mill in Six Mile Cañon. The castings were made at the Gold Hill Foundry, Lower Gold Hill.

MINERS' FESTIVAL.—The members of the Miners Association will hold a festival on the 9th and 10th inst. at the City Gardens in this city. There will be a procession, after that a lunch, and an effort will be made to show as far as possible mining in some of its branches, and life of miners in their cabins. The advertisement says that on Monday at 1 P. M. there will be some prize mining connected with the preparation of flapjacks, pork and beans and the presenting of a true and complete picture of miners in their housekeeping and the enjoyments of the miners in the olden time. They will endeavor to show the public a representation of the early mining days in California.

MINERS' STRIKE.—About 100 miners, employed by the Treasure Hill Companies, at Hamilton, Nevada, "struck" for $4 per day on the 4th inst. Their demand was at first refused and all the mines in the vicinity closed down, but next day three or four of the companies acceded to the demands and consented to pay that figure to skilled miners.

THE WOOL CLIP IN TULARE.—The season shows a falling off—owing to the severity of the winter—as compared with the clip of last year. The Visalia *Delta*, from the best information it can obtain, through the wool-growers and purchasing houses, estimates this year's product at 947,335 pounds. Last year it reached 1,474,500 pounds.

ANOTHER suit has been instituted against the Flagstaff mine, Utah for the appointment of a receiver.

About Patents.

There seems to be an infatuation connected with invention which acts in somewhat the same manner that gaming affects the gambler. Some one has called it patent lunacy, and in fact it amounts to nothing less. It is the result of a constant and continued application of the thoughts and feelings upon one single subject until it assumes its most captivating and tempting form. This feeling affects every inventor to a greater or less extent, and in a few cases amounts to a positive mania. Who has not at some time or other been compelled to listen to the laudation of some new style of churn, washing machine, or other invention, by an over-confident inventor.

Yet without this mania, this same over-confident feeling, our patent office would have little to do and our progresss would in a measure stagnate. The primary cause of this mania is the liberal provisions which our lawmakers have established in favor of the inventor. The monopoly of any useful invention for the term of seventeen years, in competent hands, is almost invariably equivalent to a fortune, and it is therefore no wonder that we find a large proportion of our population ever on the alert to pick up or originate a new idea, or a useful machine, and when once the idea is seized upon, the mania alluded to is the engine that urges on the originator to complete and patent the result.

In foreign countries, where the laws are not so favorable to the inventor, the incentive to originate new ideas is not so great, and consequently we find that fewer patents are applied for.

It is a familiar remark in the United States that if any new machine or improvemsnt is required, it is only necessary to let the people know it and it will soon be provided, not only one but a hundred, thus proving the adage that "necessity is the mother of invention."

In many cases this mania only lasts until the patent is secured, as the reaction, if it does occur, is more likely to happen at that time than at any other; the crisis has passed. This is unfortunate, as then is the time when all of the mania of the inventor is most required. The energy necessary to successfully handle a patent is seldom possessed by the inventor, at least by the professional inventor. He gets up a good head of steam to begin with and successfully secures his idea, but his steam has all exhausted by this time and no further progress is ever made. (By substituting the word "money" for the word "steam" in the last sentence, the case will perhaps be more perfectly stated.) We therefore say to the patentee, keep up the mania; don't let it flag when you have secured your patent. Throw all of your energies into the business of introducing the invention. Don't allow yourself to ask a price for your patent which is twenty times more than it is worth, and more than you hope ever to sell it for. Be satisfied with a good, ordinary profit, and you may be assured that when once you have it introduced and in public use your revenue from it will repay you for your ingenuity, and all of the time and money you have spent upon it, if the invention is in any way useful to the public.

Mining Sales.—The Helena ditch, in Montana, better known as the Big Ditch, has been sold to Wm. A. Chessman, for $28,500. It is 30 miles long and covers Last Chance, Dry Gulch, Helena Hill, California Bar and Bowery and Michigan Gulches.

The Eureka *Sentinel* says that the Excelsior and Gaslight mines, on Prospect Mountain, near New York cañon have been sold to Thos. J. Taylor & Co. for $25,000.

The Eagle mine in Spring Valley cañon, says the Unionville *Silver State*, has been sold to Geo. B. Walker, of Salt Lake, for $17,000.

The Grass Valley *Union* says that M. McDonough has purchased the claims of the Irish American Co. which are on the old Auburn road, near the North Star companies claims. Consideration not stated.

It is reported that the McMahone mine, near Schellhurn, has been sold to a San Francisco Co. for $30,000.

Mining Accidents.—The foreman of the Prospect Flat Cement Mining Company at Placerville, H. L Newton, was killed on the 3d inst. by a loaded car which fell from the upper level through the shaft.

Mr. Branvelt, one of the engineers at the Stonewall mill, near Julian City, San Diego Co., was run over by a wagon last week, and was injured to such an extent that the amputation of an arm was necessary.

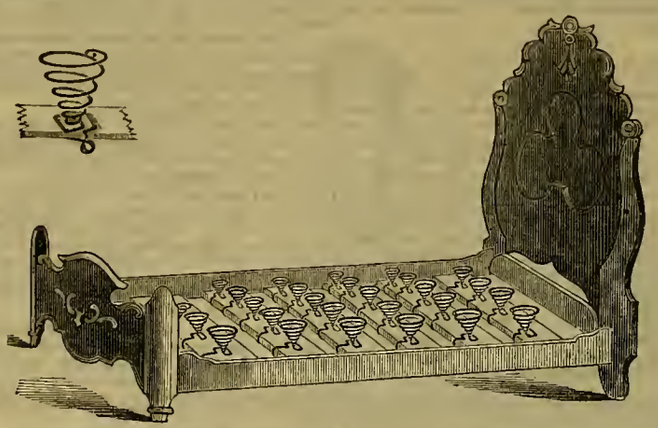
Twenty-five million of dollars has been appropriated by the city of Birmingham, Eng., to establish a system of sewage.

A Self-Fastening Bed Spring.

We give annexed an illustration of a new device for securing bed springs. As will be seen by the single spring herewith shown, the bottom of which is so constructed as to clasp the slat and hold itself firmly in position, each spring is thus self-fastening, and can be applied directly to the slats of the bedstead without making holes or any other preparation, and being all complete in itself, needs not the attachment of any wood, iron or leather work to fasten it to the bedstead or to connect it to the other springs. Moreover, when any one spring gives out it can be readily displaced and a new one substituted.

They are claimed to be superior to any other, because they are simpler, more elastic, do not squeak, (as most slat bed springs do,) have no cracks or holes in which the vermin can hide, and have no strings to break or leathers to pull out. They are equal to the best upholstered spring beds, as they are exactly like them in the principle of action, being a spiral spring, (which is acknowledged to be the most elastic and strongest spring known,) and superior to them, in as much as they are not covered with cloth, which collects dust and vermin, are much easier to handle, and cost only about one-half as much.

These springs can be applied to any ordinary slat bedstead. Their number can be increased or diminished at any time. From three to five dozen make a set, and a set can be packed in a space of one foot square, and can be attached to the slats by any person, so that no upholsterer is required for such work. The attention of furniture dealers, hotel keepers and others is called to this new device, as one especially worthy of their attention. They may be seen at 642 Mission street.



WARNER & SILSBY'S IMPROVED BED SPRING.

"Mines, Mills and Furnaces of the Pacific States and Territories."

Commissioner Raymond's last report, "Mines, Mills and Furnaces of the Pacific States and Territories," published by J. B. Ford & Co., of New York, can now be had. We have several times alluded to Mr. Raymond's book, the Congressional edition of which, however, on account of its meagreness of appropriation, was not circulated as extensively as its importance required. In fact it is almost impossible to get a copy on this coast, where it is most needed. The present edition was printed as a private enterprise and this really valuable report will now be accessible to all. It gives an account of the condition, resources, and methods of the mining and metallurgical industry on this coast, chiefly relating to the precious metals, and is a sequel to "American Mines and Mining."

The book is one which is of interest to every miner and mill-man on the Pacific Slope, since it gives not only a review of mining industry, statistics, etc., but a large proportion of the work is devoted to the subject of metallurgical processes, which are important to all. The condition of mining industry of each State and Territory is taken up and treated in a separate chapter; the metallurgical processes are under appropriate heads, written in an easily comprehensive style, while they are, at the same time sufficiently in detail to permit of a thorough understanding of the subject under consideration. The work is one of great importance to the mining community on this coast, and will fully repay any one its cost ($3.50). Dewey & Co., of the Scientific Press, are the publishers' wholesale and retail agents for the work on this side of the continent.

New Method of Prospecting.

Under the above head we made allusion in our issue of May 1st to a new method of prospecting, mentioned by the Nevada *Transcript* as about to be put in operation at North Bloomfield, by drilling a hole at the start to the full proposed depth of the shaft with a diamond drill, and filling the same with sand, and taking out the sand to the proper depth for successive blasts. We expressed the opinion that such a plan would not work; but that if one hole was bored in the center, and several more around it, and all fired simultaneously by electricity, a great saving of time and labor would result.

During the past week we have received a private letter from Prof. Wm. B. Blake, from which we learn that the plan we suggested has been put into practical operation in Pennsylvania. We make the following extract from the letter:—

"I was for a day or two at the meeting of the Institute of Mining Engineers, at New York, at which several very important papers were read, and among them one describing a very great advance in the art of shaft-sinking, now being practically shown in two shafts in Pennsylvania. The diamond drill is used, and a series of vertical holes are bored at even distances within the walls of the shaft or its limits, horizontally. These holes are bored to a depth of 300 feet, and are then all filled up with sand. When all is ready to begin blasting, three feet in depth of the sand is pumped out of all of the holes. A charge of dynamite is placed *in each of the central holes*, and these charges are all simultaneously exploded by electricity. The result is that a mass of rock is lifted out of the center to a depth of three feet. The sides are then blasted down, and when the rubbish is cleared out the operation is repeated. The result is a clean-cut shaft, with sides almost as smooth as if they had been cut down by chisels. The work proceeds with great rapidity. Some important improvements have been made in the drill-carriers. Compressed air will soon replace ths rotary engines now used. I have not time to enter into the details. They will all appear in the journal of the Institute."

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Crown Point Ravine G. and S. M. Co.—May 31. Location: Gold Hill District, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—George D. Roberts, J. J. Hucks, S. W. Lee, Martin White and M. C. Hillyer.

Ruby Hill M. and M. Co.—May 31. Location: Ruby Hill District, White Pine. Capital stock, $3,000,000, in 30,000 shares. Trustees—Ferdinand Vassault, Thomas R. Hayes, E. J. Moore, H. W. Byington and Benjamin Dore.

Aztec M. Co.—June 4. Location: Ely District, Lincoln county, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—Geo. D. Roberts, G. Howard Thompson, M. J. McManus, Peter Hopkins and Robert J. Harrison.

Insurance M. Co.—June 4. Location: Virginia M. District, Storey county, Nevada. Capital stock, $3,000,000, in 30,000 shares. Trustees—James L. Blaikie, Samuel L. Theller, R. F. Bunker, R. G. Brown and John Landers.

Fairfield S. M. Co.—June 5. Location: Wallipai District, Mohave Co., Arizona. Capital stock, $1,200,000, in 12,000 shares. Trustess—W. H. Hardy, Herman Brixhaum and William J. Bennett.

Rising Star M. Co.—June 5. Location: Nevada county, California. Capital stock, $2,000,000, in 20,000 shares. Trustees—Wm. J. Gunn, J. J. Hucks, Charles E. Elliott, Thomas Bryan and C. M. Kinne.

Concentrators.—Parties who have inquired of us about ore concentrators are referred to a certificate appearing this week in the advertisement of Hendy's Patent Concentrator.

U. S. Centennial Commission.

We have received from Prof. Wm. B. Blake, Chairman of the Committee to propose a system of classification for the Centennial Exposition of 1876, some printed slips, in advance of publication, giving a report of the programme which has been made in the work of that Committee. In the formation of the system proposed, the governing idea has been to group together objects in the following order:—

1. The natural products useful to man, or the basis of manufactures.
2. The manufactures and results of the combinations of these products.
3. The means and appliances by which such results have been accomplished.
4. The resultant effects of such productive activity.

The raw materials are first presented, and then in succession the results of their use by man, leaving until the last the higher achievements of intellect and imagination.

It is a natural and simple classification, and we think well calculated to show effectively—more effectively than any other system—the development of man, and the progress of the arts and of civilization.

Ten comprehensive divisions, to be named *Departments*, have been arranged, each of which are subdivided into ten groups, each group into ten classes, thus giving abundance of latitude for the appropriate reference and classification of any object. It was one of the defects of the classification of 1867 that there was not enough classes. The arrangement now proposed not only remedies this difficulty, but it also gives us elasticity and an opportunity for expansion under every group and under every department; an advantage that only those who have had to deal with exhibitions can fully understand and appreciate.

The departments will be numbered from I to X, and the groups from 1 to 100, while the classes will be numbered from 1 to 1000. Thus the number of any class will at one indicate the group and department to which it belongs. This is a system similar to that upon which the houses are numbered in the city of Philadelphia, where the number of the house at once indicates its location with respect to the streets.

A peculiar and interesting feature in the arrangement will be the effort to show, at a glance, the progress of industry and invention, especially in the United States during the century. For instance, the printing press of Franklin will be shown in the same range with those of Hoe, Adams and Bullock.

The cotton gin of Whitney, yet preserved, will stand side by side with those used to-day, and the early efforts to construct locomotives will be contrasted with the latest.

We understand that the arrangements for the exhibition are being made in a most satisfactory and energetic manner.

A Convenient Table for Miners.

It is often convenient to weigh large bars of bullion on a platform scale, and to calculate Troy ounces from the avoirdupois weight so obtained.

This is specially the case at isolated mining localities, where no accurate bullion balances and sets of large Troy weights can be obtained. The following table, which has been prepared for us by Mr. H. G. Hanks, will be found very useful in such cases:

Avoirdupois.	Troy ounces.
1 ounce	0 9 1 1 4 5 8
2 "	1 8 2 2 9 1 6
3 "	2 7 3 4 3 7 4
4 "	3 6 4 5 8 3 3
5 "	4 5 5 7 2 9 1
6 "	5 4 6 8 7 4 9
7 "	6 3 8 0 2 0 8
8 "	7 2 9 1 6 6 6
9 "	8 2 0 3 1 2 4
10 "	9 1 1 4 5 8 3
11 "	1 0 0 2 6 0 4 1
12 "	1 0 9 3 7 4 9 9
13 "	1 1 8 4 8 9 5 8
14 "	1 2 7 6 0 4 1 6
15 "	1 3 6 7 1 8 7 4
1 pound	1 4 5 8 3 3 3 3
2 "	2 9 1 6 6 6 6 6
3 "	4 3 7 4 9 9 9 9
4 "	5 8 3 3 3 3 3 3
5 "	7 2 9 1 6 6 6 6
6 "	8 7 4 9 9 9 9 9
7 "	1 0 2 0 8 3 3 3 3
8 "	1 1 6 6 6 6 6 6 6
9 "	1 3 1 2 4 9 9 9 9

A single example will explain: Suppose the bar to weigh 74 pounds and 9 ounces; set the figures thus:

70 pounds	
4 "	
9 ounces	

Look for 7 pounds in the table. Opposite will be found 102.0833+; move the decimal point one place to the right, and it will represent 70 pounds; set this on the first line to the right of the "70."

Opposite 4 pounds in the table will be found 58.333+ ounces. Set this under the first.

Opposite 9 ounces in the table will be found 8.203+; place this under those already set down, and add the whole together. The sum represent the weight of the bar in Troy ounces and decimals.

70 pounds	1020.833
4 "	58.333
9 ounces	8.203
74 pounds 9 ounces	1087.369

Domestic Economy.

New Mode of Washing.

Scienca is not above giving its attention to even tha smallest things, as is ahown by an artiala in the *Moniteur Scientifique* for March, wherein Dr. Queonevilla describes something new in washing, whereby our linen may be saved from tha destructive effects of soda and other washing-powders.

The plan has been extensively adopted in Germany, and introdnced into Belgium. The operation consists in dissolving two pounds of soap in about three gallons of water as hot as the hand can bear, and adding to this one tablespoonful of turpentine and threa of liquid ammonia; tha mixture must then be well stirred, and tha linen steeped in it for two or three hours, taking cara to cover up the vessel containing them as nearly hermetically as possible. The clothes are afterward washed out and rinsed in the usual way. The soap and water may be reheated and used a second time, but in that case half a tablespoonful of turpentine and a tablespoonful of ammonia must be added. Tha process is said to cause a great economy of tima, labor and fuel. The liuen scarcely suffers at all, as there is littla necessity for rubbing, aud its cleanliness and color are perfect. The ammonia and turpentine, although their datersive action is great, have no injurious effact upon the linen; and while the former evaporates immediataly, the smell of the latter is said to disappear entirely during the drying of the clothes.—*Am. Artizan.*

We would add to the above the following from the *Providence Journal*, on tha specific use of ammouia for varions honsehold purposes:—

Ammonia, or as it is commonly called, spirits of hartshorn, is a powerful alkali, and dissolves grease or dirt with great ease. It has been recommended very highly for domestic pnrposes. For washing paint, put a teaspoonful in a quart of moderately hot water, dip in a flannel cloth, and than wipe off the woodwork; no scrubbing will be necessary. For taking grease spots from any fabric nse the ammonia nearly pure, thcn lay white blotting-paper over the spot and iron it lightly. In washing lace, put about twelve drops in a pint of warm suds. To clean silver, mix two teaspoonfuls of ammonia in a quart of hot snds. Put in yonr silver-ware and wash, using an old nail-brush or tooth-brush for the purposa. For cleaning hair-brushes, etc., simply shake tha brushes up and down in a mixture of a tablespoonful of ammonia to one pint of hot water; when they are cleansed rinsa them in cold water, and staud tham in tha wind or in a hot place to dry. For washing finger-marks from looking-glasses or windows, put a few dropa of ammonia on a moist rag, and make quick work of it. If you wiah your house plants to flourish, put a few dropa of tha spirits in avary pint of water used in watering. A teaspoonful will add much to the refreshing effects of the bath. Nothing is better than ammonia water in cleaning the hair. In avery casa rinse off the ammonia with clear watar. To which we would add that, for removing greasa spots, a mixture of equal parts of ammonia and alcohol is better than alcohol alone; and for taking out the red staina produced by tha strong acids in blua and black clothes, thera is nothing better than ammonia.

Economy in the Household.

Mrs. O. T., of Missouri, writes sensbly regardiug economy in the house and on tha farm. Housekeepers should not go in dabt to tha storekaapera just because they will trust them for a few months. When one caunot pay for table luxuries, it is not wise to nse them three times per day. It is not right to give children tea and coffae just becausa it may look stingy to outside people, when we know that the children ara better off without them. Tryiug to keep up with the fashions is extravaganca on the part of the farmer's wifc and daughters, unless wealthy. To dress neatly and comfortably is all that is required. Usa mora fruits and vegetables. The finest flour is not the best; mix the shorts with tha flour and tha food is more palatable and haalthful. She prepares tha mixture as follows:

Taka about one-fourth fine flour and three-fourtha shorts, raise with yeaat and baka on a griddle. The cakes are to be eaten with molasses or butter, or both, the samea as buckwheat cakea.

Her letter closes as follows: "It is the duty of every housekeeper to see that nothing goes to waste in or about the house that sha can make use of, and it is the duty of every farmer to sea that nothing goes to waste on the farm that he can make use of. If we will attend to thasa things we will get along better and wa shall like farm life better. We let too much of labor come to naught."—*Prairie Farmer.*

A Rival to Tea and Coffee.—Tea and coffee ara threatened with a Brazilian rival, called guarana. The guarana consists of tha seeds of a tree known to botanist as tha *paullnas sorbitis* which is very abundant. The tree produces fruit about tha size of a walnut, containing five or six aeeds. The seeds are roasted, mixed with water and dried. Before being used they require grinding when they fall iuto a kiud of powder. The active principle is an alkaloid idautical with that found in tea or coffee, but thera is twica as much of it in guarana as there is in tea. The effects are similar to those of tca and coffee.

Convenient Arrangement of Houses.

It would seem that tha adjustmant of the rooms is secondary to external appearances, while the reverse is indead the case. A kitchen should be in an L; that in summer tha honsa need not ba heated, and in winter filled with the odor of cooking. The kitchen and living room should have but one door between them, and without passages or steps up or down.

The size of the kitchen should ba determined by the uses for which it is designed. For myself, I should prefer to hava it small, say twelve feet each way, with a cupboard, sink, cistern pump and painted floor.

The kitchen disposed of, then comes what is scarcely second in importance—the bedrooms. A woman who wishes to concentrate her work as much as possible, will prefer having at least her own sleepiug apartment on the ground floor, and opening directly iuto tha living room. And all kuow that this should be large and well ventilated, with a closet opening into it.

Running up and down stairs is woman-killing work, and should be avoided as much as possible, by having oua or mora bedrooms below. Tha living room and parlors can ba disposed of accordiug to the taste aud means of the builder.

We are annually presented with plans for country cottages, which abound on tha outside with ornament, and on the inside with a labyrinth of entries, passages and pantries (pantries and closets ara of coursa necessary). That utility should ba sacrificed to ornament is evidently in bad taste, besides baing poor economy. If a man's means are uot sufficient for both, build substantially, and trust the future for decorating the outside.

A substantial, well proportioned, well kept house, is always a good looking house. But boards placed around the bottom to hide an uusightly openingbeueath, with latticed porches and ornamental cornices, is a disgraca to the roadside.—*Ohio Farmer.*

How to Cure Hams.—Here is J. Howard McHenry's recipe: The maat, after being cut out, must ba rubbed, piaca by piece, with very finely powdered saltpetra, on tha flesh side, and whera the leg is cut off; a tablespoonful (not heaped) to each ham, a dessert-spoonful to each shoulder, and about half that quantity to each middling and jowl; this must ba rubbed in. Then salt it by packing a thin coating of salt on tha flesh sida of each piece, say one-half an inch thick; pack tha pieces on a scaffolding, or on a floor with strips of plank laid a few inches apart all over it (that is, nndar the meat); the pieces must be placed skin sida down, in the following order: first layer, hams; second, shoulders; third, jowls; fourth, middlings. Take the spare rib out of the middlings. The meat must lie iu this wise: Six weeks, if the waathar is mild, and eight if vary cold, tha brina being allowed to run off freely.

Orange Chips—Oranges are lass used upon tha tabla than thay should be. Here is a very good way of serving them up as "oranga chips."—Cut your oranges lougways, taka out all tha pulp, and put the riuds iuto rathar strong salt and water for six days, then boil them in a larga qnantity of spring water until thay ara teuder; taka them out, and lay them on a hair sieve to drain, then make a thin syrup of fine loaf-sugar (one pound to one quart of water); put in your peels, and boil them over a slow fire till you sea the syrup candy about the pan and peals, then taka them out and grate fine sugar over them. Lay them on a hair sieve to drain, and set them in a stova, or befora the fire to dry. Lemon chips or candied peel may be made in tha same way.

All over India, sweetmeats are consumed as a substantial article of food. A native when traveling seldom eats anything elsa, and between tha two great meals, at all timea he whiles away tha long noon of the Indian summer day by sucking lollipops or candy between the whiffs of his hookah. Large dishes of sweetmeats are very common prasents to make on religious fastivals or domastic red-letter days; and whan a Hindoo wants to ba very merry or very dissipated he never gata drunk, but goes to a "millial" shop and makes himself ill with candied sugar.

For Mixed Pickles, prepare any vegetablas you lika by cutting tham in pieces, and let them lie in aalt and water for two or threa days; then make the pickle in the following manner: Boil the quantity of vinegar required with pepper-corns, mustard-seed, a small quantity of mace, a few Cayanne pods and ginger, and half a ponnd of flour of mustard mixed smoothly in a basin, to ba put in while boiling; put all together in a large stone jar.

Rancid Butter may ba greatly improved, and made sweet by the following process:—Melt the bntter at a tolerably high temperature, iu fact, till naarly boiling. Strain clear through cloth, and thoroughly wash with water, to which has been added a little solution of chlorinated soda, or, as it is commonly called, Labarraque's solution. Finally wash with clean watar. Butter so manipulated will ba sweet and good for cooking purposes; but will not have the flavor of the fresh made article.

Fruit Stains.—Fruit stains may, it is said, be removed by moistening the article affected with a solution of hyposulphite of soda, and adding to it a little pulverized tartaric acid, which is to be rubbed on the stain, which will soon bagin to disappaar, whan tha article can be cleansed with warm water.

Selected Receipts.

Oyster Pie.—Cover a well-buttered, deep plata or tin—a soup plata answers perfectly—with puff paste; lay an extra layer around the edge of the plate, and baka it very naarly enough. That done, fill the pie with oysters, seasoning with nutmeg, pepper, salt and buttar; dnst in a littla flour amongst them, and cover all with a thin puff paste. Baka quickly; when the top crust is done the oysters will be done also. If to be eaten hot, serve ae soon as baked, as the top crust quickly absorbs the gravy. If to be eaten cold, let it cool nntouched, in the plate or pan. It is quite as good in this way as hot, and is excellent for pic-nics or for traveling.

Rolled Jelly-Cake.—One cup of sugar, one tablespoouful of butter, ona and a half cup of flour, two-thirds of a cup of milk, one egg, two tea-spoonfuls of baking-powder, sifted with the flour. Bake iu a large sheet, and when done, spread on tha jelly, and cut tha sheet in strips three or four inches wide, and roll up, If, iustead of jelly, a sauce is made and spread between the layers of the cake, it may be aaten as cream pie, and furuish a very nice and easily prepared dessert.

For the sauce.—Beat together one agg, one teaspoonful of corn-starch, one tablespoonful of flour, and two of sugar. Stir it into a half pint of milk, and boil till it forms a good custard; remove from the fire, and flavor with vauilla.

Green Pea Soup.—Take some young carrots, tnrnips, ouions, celery, aud cabbage-lettuces; cut them in slices, and put them in a stew-pau, with a little butter, and some lean ham cut in pieces. Cover them closely, and let them stew for a short time. Fill up with stock sufficient for the soup required, and let it boil until tha vegatables are quite soft, adding a few leaves of mint, and tha crust of a roll; pound all, and having boiled a quart of peas, as green as yon can, strain them off, and pound them also; mix them with tha rest of the ingredients, and pass throngh a siave. Heat it, and season with salt, pepper, and sugar; add a few young boiled peas, aud use the spinach to restore it.

Cleaning Gutta Percha.—This is best dona by using a mixture of soap and powered charcoal, polishing afterwards with a dry cloth with a littla of tha charcoal on it.

Salad Dressing.—This is also excellent over sliced tomatoes in tha summer. Taka tha yolk of one fresh egg and mix with it two tablespoonfuls of olive oil very slowly, add oue and one-half spoonfuls of mustard, three spoonfuls of salt, a little pepper, and last of all two spoonfnls of vinegar. Beat the white of the egg to a stiff froth and lightly stir in.

Apples stewed for sauce should be pared, cored and put iuto cold water nntil they are ready to be cooked, to keep tham from discoloriug. Add a littla water, putting them in a porcelain kettle or stew pan. Cover them, and let them cook gently.

Loss of Weight in Cooking.—The loss of weight in a leg of mutton in cooking has been found, by actual experiment to ba as follows: Before roasting, tha weight was uine pouuds and ten onncea; after roasting, six pounds and twelve ounces; weight of cooked meat, four pounds aud thirteen ounces; weight of bone, ona pound and fifteen ounces; of gravy, ten ounces.

Clarifying Water.—Two grains of alum to a pint of water that is not fit to drink, render it perfectly clear and pure, and the taste of alum will not be parcaived. A little pulvarized alum thrown into a pail of water, and allowed to stand fifteen minutes, will precipitate all tha impurities, and leave it perfectly clear.

To Brown Potatoes Under Meat.—Boil some fine, large, mealy potatoes; take off the skins carefully, and about an hour bafore the meat is cooked put them in the dripping pan, having well dredged tham with flour. Baforc serving drain them from any grease, and serve them up hot.

A Modern Kitchen Maid.—Not long since an excellent Kentucky housewife had occasion to send to Louisville for a cook. The latter in a few days put in her appearance, arrayed apparently in a large quantity of cast-off masquerade finery of the Queen of Sheba, dilapidated panniers, flounces, hoops, and with a stunning headdress that would have befitted the Queen of Hayti—jute curls, frizzles, chignons, and rats in alarming profnsion. The former looked at the latter in astonishment, and when sufficiently recovered, she informed her that she did not think she would suit as mistress for the kitchen, as her appearance indicated it would require three-fonrths of the day to get up her elaborate head-toilet alone. "Why, la, ma'am, answered Dinah, I *never* combs my head!"

Tobacco-cancers on the lip and tongue are increasing so alarmingly as to greatly diminish pipe-smoking in Germany. This deadly form of tha cancer is incurable. In our country we have a few fearful examples. President Stirling, of the Burliugton Bank, N. J., clerk of C. Dodge & Co., Bankars of Philadelphia, and a physician of Sonoma, California, have fallen victims to the cancer of the mouth.

The Vine and the Cottage.

Among the thousands of men of moderata means, who own their little cottage, in every town and villaga in tha land, too many are fonnd without the simpla adornment of a vine of any kind or variety. We do not refer to tha absence of a garden or even a miniature vineyard of a few vines, for oftantimes there is not room either in front or back yard of tha cottaga for either. And yet there is room for a vina or two or three of them, so that there is a bare spot of ground in ona cornar, of a foot square not covered by a building.

Let a vine be planted there, and if there is no room for a little covered way of trellice work, carry tha vine up the sida of the doorway and let it spread ovar the whola wall of the house, and year by year it will repay yon for your care, in tha luscious fruit it affords, besides tha real pleasure it gives in witnessing its annual expaneion. If you ara in a locality too cold for a fruit-bearing vine, then taka one of the many hardy, beautiful flowering vines or runners to ba had of almost any florist and plant it out, and let the wife and daughters saa that it be properly trained and cared for, and it will prove a thing of beauty aud of course a joy forever, or for many years.

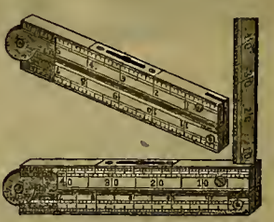
13 and 15 Fremont street, near Market, San Francisco.
10v14or

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.



ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4 For agents' terms, address STEPHENS & CO.,

Endless Chain Elevator,
FOR RAISING WATER FROM WELLS.
BALL & CRARY, Patentees.

The inventor claims that his ELEVATOR excels any other apparatus that has ever been brought before the public for the purpose of raising water from wells. Its chief merits are: First—The water is obtained from the well in a purer and colder state, for the reason that it is drawn from near the bottom. Second—It is operated with the least difficulty, particularly in lifting a certain amount of water from any depth in a given time, as compared with any other mode. Third—It obviates all necessity for going down into the well in putting in the machinery, or for repairing the same, as such labor can be performed at the surface. Fourth—It can be easily taken out of one well and transferred to another. Fifth—It is less liable to get out of repair—but when repairs are necessary they can be easily made by any one; the action made by the Endless Chain and buckets keeps the well properly ventilated; there is no possibility for the person operating it [nor for a child] to fall into the well.

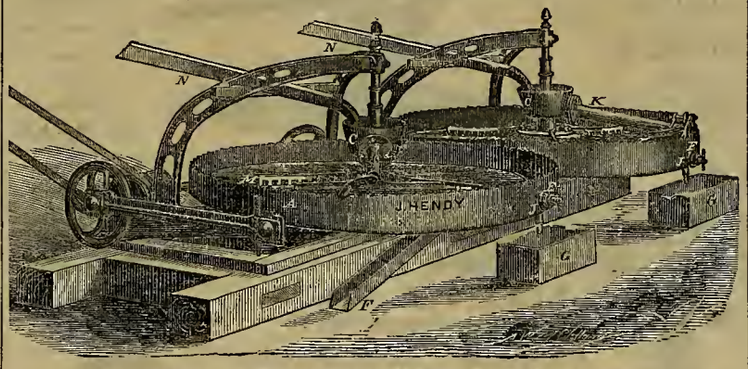
HENDY'S
LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentratore in all mills where gold or silver ores are reduced. No milla should ba without them for the following reaaons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and tha action of the pan, fall to the bottom and adhere.
4th. They raquire hut little power and attantion to run them, and with ordinary care will laat for yeara.

I have been familiar with tha workinga of your Concentratora for four years past; have run them myself in the North Star Mine, Grasa Valley; am familiar with their practical workings on the Empire Mine, Grasa Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this tastimonial. For further information you are at liberty to refer to,

Youra, respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

GRASS VALLEY, April 20, 1872.

JOSHUA HENDY, Esq.—San Francisco—*Dear Sir:*—Having had charge of eight of your Concentrators for two years past, at the North Star Mine, Grasa Valley, I can speak from experience, and cheerfully recommend them to every one engaged in gold or silver ores that requira concentrators. They require but little power and attention, are the best concentrators and amalgamators that I have ever saen or used, and with ordinary care and attention are not liable to get out of order. I most cheerfully give you this recommendation, and for furthar information you can refer to me at North Star Mine, Grass Valley.

Yours truly,
HENRY BOUDOIN.

References:

Reference is made to the following mills, some of which have had HENDY'S CONCENTRATORS in uso for over four years.

EMPIRE MILL. (8 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grase Valley, Nevada County.
VULTURE CO. (8 Concentrators).....Prescott, Arizona.
NOYE'S & CO'S MILL. (2 Concentrators).....Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....Owyhee District, Idaho.
EL TASTE CO. (3 Concentrators).....Sonora, Mexico.

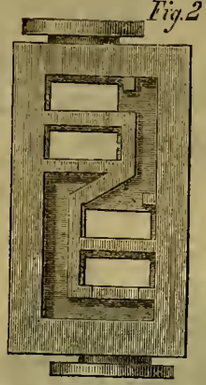
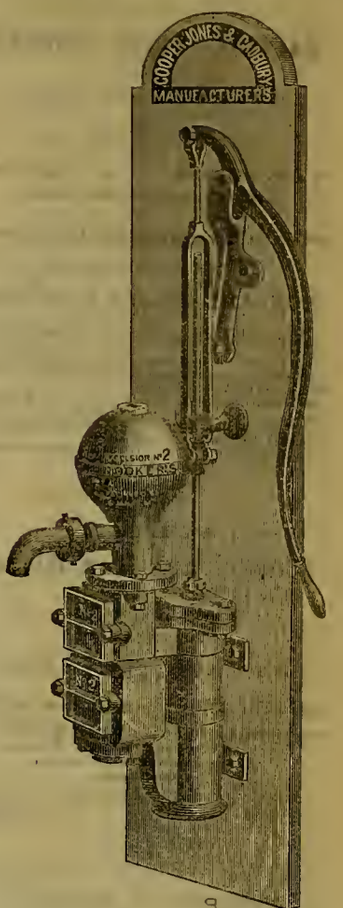
AND SUBSTANTIAL IN EVERY RESPECT
FOR DOMESTIC USE
FIRES OR IRRIGATING PURPOSES
IT IS FAR SUPERIOR to any OTHER PUMP.
NO TROUBLE

VALVE.



VALVE BOX.



We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pumps of equal caliber. It has Poppet Valves, which cannot be wrongly placed in the Pump. The Fair of the Mechanics' Institute, held in the city of San Francisco, awarded the owners of this Pump FOR ITS SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Suitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. ☞ See Circular for particulars.

GENERAL AGENTS:

Messrs. **BRITTAN, HOLBROOK & CO.,**

111 and 113 California street, and 17 and 19 Davis street, S. F.,

Are Agents for the sale of the Excelsior Pump, who make liberal discount to the trade. **H. J. BOOTH & CO.,** Union Iron Works, First street, corner of Mission, S. F., manufacture and have the sale of the Excelsior Pump.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alleghany Consolidated Gold Mining Company.

—Location of Works: Alleghany, Sierra County, Cal.

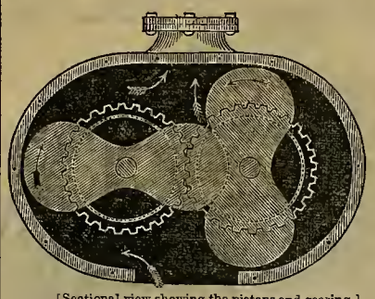
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

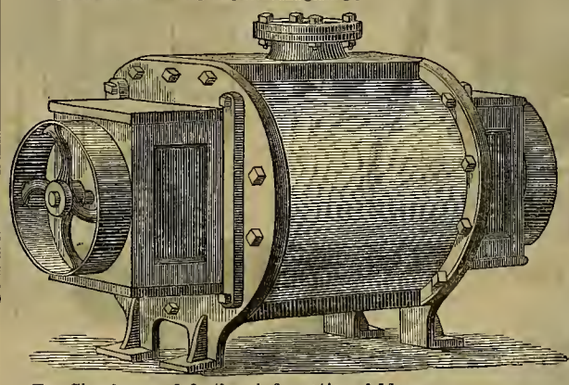
Stockton, Cal.



[Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may he seen at W. T. Garstt & Co.'s Brass Foundry, San Francisco; Gould & Ourry and Savage S. M. Co.'s, Nevsds; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certsin parties, not anthorized to manufacture the Blower, have put in the market machinos of inferior construction, which do not answer all the requirements of the genuine srticle. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

THE HIGHEST PREMIUM

Awarded hy the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Luhricators are acknowledged hy all engineers to be superior to sny they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve snd pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates smount used per hour. Packing on rods snd steme lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shnt off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is alwsys cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured hy California Brass Works, 125 First street, S. F. 24v23tf

Notice is hereby given, that the copartnership herctofore existing hetween A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved hy mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.

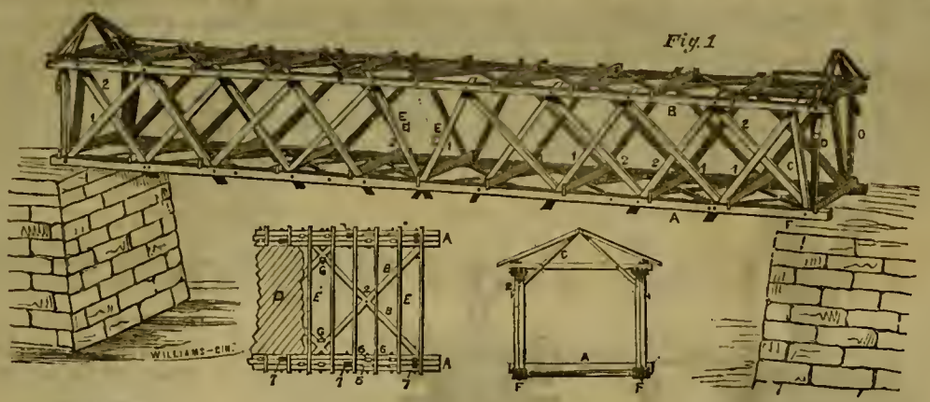
PACIFIC BRIDGE COMPANY,



WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

SCIENTIFIC PRESS

Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.

PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

DEWEY & CO.,

ONE DOLLAR A YEAR

— FOR THE —

PACIFIC COAST

Mercantile Director.

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustrations and Sketches of Prominent Men and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provision;" "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the SCIENTIFIC PRESS or the PACIFIC RURAL PRESS will be supplied at half price.

Published by MURRAY, DEWEY & CO.,
At the Publishing Office of the Scientific Press and Pacific Rural Press, San Francisco.

The Pacific Rural Press.

THE PACIFIC RURAL PRESS is now in its third volume. Its columns contain a large amount of original information upon the different branches of husbandry on this coast. Its great variety of contents is properly systemized for the convenience of the reader, and ably prepared in pleasing language and style. Each number contains something of rare interest to every member of the household.

The state of this new field of agriculture, so different from all others; the new and improved methods of farming necessary here; and the absence of any published record of farming and rural experience on this coast, form a combination of circumstances which render a really good journal of greater importance to farmers here than are similar issues to farmers in any other part of the world.

The PACIFIC RURAL PRESS has been heartily received and well patronized, and its liberal success enables us to improve and enrich its columns from month to month.

Its reading and advertising matter is entirely chaste. All farmers should subscribe without delay. Every honsehold should enjoy its richly filled pages.

Subscription, in advance, $4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts. Address

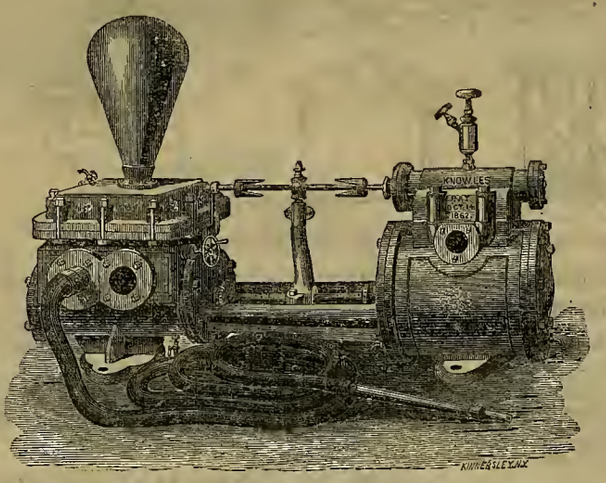
KNOWLES' PATENT STEAM PUMP.

Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."

v113-awbp



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—This is an excellent Pump, well made, and gives a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)

G. W. DICKIE, H. B. ANGEL, OHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention at the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding*. Hooker's Hand Pump was the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California

☞ A complete stock of all sizes constantly on hand at the Machinery Warehouse of the Agents,

TREADWELL & CO.,
Market Street, cornor of Fremont, SAN FRANCISCO.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

SAN FRANCISCO, SATURDAY, JUNE 15, 1872.

VOLUME XXIV. Number 24.

The Hydraulic Ram.

EDS. PRESS:—Boing a subscriber to your valuable paper, I wish to ascertain something abont tho working of a hydraulio ram, through your columns. I do not understand anything of the workings of the ram, tho number of feet they will force the water, the amount of water needed to work them or the quantity of water forced np tho elevation, the cost of the ram, pipe, etc., and whore they can be purchased. If you can answer my question yon will confer a favor on O. O. I.

Bear Valley, Colusa Co., May, '72.

Wo have received numerous qneries similar to tho above during the past year, from which we infer that mnch attention is heing given to this mode of snpplying water for household and farm purposes. It is in view of this that we have had an engraving propared from an original drawing, giving a view of the working parts of the machine, which, with the aocompanying description, will give a clear insight into the principle upon which the machine works. The tahle appended will also enahle the reader to judge of the size of the ram which he may require to meet his needed supply, or to ntilize the amount of water he may have at his command. The illustration which is herewith given differs from any with which we have met in any of the technical works of the day, and shows the machine in its most improved construction. We hsve examined some of these machines, for sale hy the importers, Messrs. Brittan & Holhrook, of this city, who can be consulted fully with regard to pricos, etc., which we helieve range from $9 to $60, according to the size of the machine.

Philosophy of the Hydraulic Ram.

Fluids are subject to the same law of gravity as solid bodies, and a mass of fluid descending vertically has its motion accelerated in the same manner as a solid mass, and the momentum generated is the product of its quantity of matter and velocity. If a column of water moves throngh either a vertical or an incline pipe, it acquires a velocity, which from the friction of the pipe will soon become nniform, and the momentum generated will be measured by the mass, multiplied into the uniform velocity; new force is also necessary for the destruction of motion, and the shorter the time through which it acts the greater is the effect produced. Thus a small hammer of steel is more effective against a nail than a mallet twenty times its weight, hoth moving with the same velocity. By the density of the face the motion is destroyed instantly, and instantly received by the nail. In the mallet, motion is communicated gradually, and diffused more or less over the body into which the nail is driven.

The sudden destruction of motion in fluids as a mass is attended with effects precisely analogous. When the motion of a large body of water is suddenly stopped, the surface which stops it sustains a great force. The pipes of our hydrants are sometimes bursted when the stop-cock is suddenly shut off.

The power of the hydraulic ram is constructed on this principle, being an impnlsive machine, deriving its power from the work accnmulated in the water which snpplies it.

In the illnstration herewith presentod, *A* is a valve which opens downwards, allowing the water to escape, and so produces a current down tho conduotor pipe *H;* the water acqniring a sufficieut velocity will close the valve *A*. The motion is thus suddenly stopped, cansing a reaction and a pressure snfficient to open the valve *B*, and forces water into the chamber *C*. The pressnre overcome, the valve *A* falls by its own weight, and the current again directed towards the opening *A*, the pressure at *B* being removed, the valve falls and closes the chamher *C*. The ram is now in the same condition as at first. The water acquiring a sufficient velocity, closes valvo *A*, and is forced into chamber *C*, and so the action continues.

The space *C* is an air chamher, from which the supply into the discharge pipe *E* is steady. If a ram he used to raise water to a grcat elevation, it would be suhjected to a great inoonvenience that would soon destroy the benefit of the air chamber, from the fact that if the air he suhjected to great pressnre, it will in time be incorporated hy the water, and to remedy this a very small hole shonld be made in the upper side of the pipe *H* at *F*. Where the rush of water is suddenly stopped by the valve *A*, a partial vacuum is produced below the air chamber hy the recoil of the water and air enters at *F*, and is afterwards forced into the chamber *C*, and supplies the deficiency. In small rams the opening is not necessary.

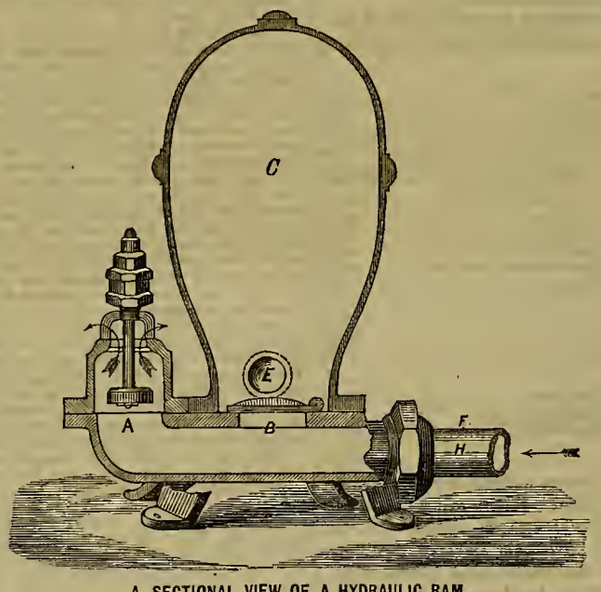
The annexed tahle has heen prepared to show the nseful effects of this device for raising water, designating the capacity of varions rams, with the necessary appendages of pipe, etc.:—

Size of Ram.	Amount of Water Delivered Per Minute.	Conduction.	Diameter of Pipes. Inches.	Discharge.	Weight of Ram.	Space Occupied.
2	3 quarts to 2 gals.	⅜	⅜	½	22 lbs.	1 cubic ft.
3	1½ " " 4 "	1	½	¾	29 "	
4	3 " " 7 "	1¼	¾	1	35 "	
5	6 " " 14 "	2	¾	1¼	55 "	
6	12 " " 25 "	2½	1	1½	125 "	4 cubic ft.
7	20 " " 40 "	2¾	1¼	2	200 "	
10	25 " " 75 "	4	2	3	700 "	18 cubic ft.

The above table is calculated for a conductiou pipe, with a head not exceeding ten feet, with 25 to 50 feet length of conduction pipe, and 50 to 100 feet hight of discharge pipe.

If the ram he placed under a greater head or fall than designated in the ahcve tahle, then the strength of the conduction pipe must he increased—that conseqnently increasing the weight; also, should it be necessary to force the water to a greater hight than those mentioned, the discharge pipe must he increased in thickness in proportion to the pressure exerted, and the diameter enlarged.

If the head of water be over that given in the tahle, then a smaller sized ram will furnish the same quantity of water as a larger one under a less head. For instance, a No. 4 would be of sufficient capacity, under a head of 8 or 10 feet, to deliver 7 gallons per minute; whereas if the head was hut 3 or 4 feet, a No. 5 would he necessary to deliver the same amonnt. If the head is a large one, and a greater supply of water delivered be required than one ram will supply, then increase the numher of rams, for several rams can he erected so as to deliver into one discharge pipe, each ram having a separate conduction pipe to its head. There is a governor attached to these rams, by which the supply is regulated, and the quantity delivered is not affected by the rise and fall in the head.



A SECTIONAL VIEW OF A HYDRAULIC RAM.

THE mines of LaSalle, Ill., now produce 700 tons of coal daily.

The State Fair.

The indications are that the California Stato Fair will far exceed this year any fair of the kind ever held in the State. The visiting committee are traveling among the producers and exhibitors, and give most flattering accounts of the prospects. Col. Younger, of the committee who has been among the cattle, sheep and goat men of the Sontbern Counties, writes to the Board of Directors as follows.

"I mnst say that I have never seen any people in better spirits. Their crops are looking splendidly, and stock the same.

There will be the largest exibition of sheep and angora goats and their grades that has ever been made at any fair in the United States. You will have to make more room for sheep and goats. From this section alone, there will be from three to four hundred head of sheep and goats. They are preparing to contend for every premium offered—in other words, they intend to make these departments a success at the State Fair. The prospect is that the coming fair will be the greatest exibition ever held in any State in the Union. Great interest is manifested everywhere."

SAN FRANCISCO MICROSCOPICAL SOCIETY. The regular semi-monthly meeting of this Society was held on the 7th inst. A fine specimen of platin. cyanide of magnesinm was presented hy Mr. Charles G. Ewing. The committe on purchase of instruments reported that they had sent for two first class instruments with accessories including a cahinet capahle of holding 1,000 objects. C. M. Kinne read a paper on the scale insect which was spoken of at the previons meeting. Under the microscope it appeared of a reddish color with dark spots, tortoise-shaped, flexible hack proecting over the body and legs, fringed with a sort of hair. It has apparently eight legs. The mouth is large and circular. The insect fastens itself to one spot, lays about 100 eggs aud then gradually shrivels np and dies, leaving the scaly covering as a protection for the eggs. The insect is about one-tenth of an inch long and half as wide. The young are a yellowish green color.

Mr. Hanks showed a 1-15 inch object glass of fine construction with which animalcnlae from the city water were examined. It is proposed shortly to incorporate the society.

THE PIONEER MINERS' ASSOCIATION.—The first annual festival of this association was held at the City Gardens in this city on the 9th and 10th inst. An old time lunch of pork and beans, flap jacks, etc., was set out for the guests. The association paraded the streets headed by a band, all dressed in the characteristic costnme of the miners of early days. All the requisites for illustrating the methods of mining were supplied. Long toms, sluices, cradles, etc., were arranged near the lake, and some "salted" dirt was washed ont. An arastra was in operation, and a shaft was sunk; the Court of the Justice of the Peace was in full blast. A number of miners cabins were erected and cooking done in good style. Prizes were awarded for the best miner; best cook; best rocker; best flap-jack; best two sluices; shaft sinking; representation of Judge Lynch; best chimney, etc. A dance wound up the festival. The association numbers about 200 members, embracing many old pioneers. It is a benevolent organization intended particularly to assist old-time miners who have become aged and infirm.

CORRESPONDENCE.

The Manufacture of Tea.

EDITORS PRESS:—I find hy yonr paper that something is heing done in the way of experiment towards the manufacture of tea in California. I have much pleasure in sending you a few of the methods which I have successfully employed in India, commencing with green teas.

Green Tea—Process No 1.

First day and night—1. Plucking the leaf; 2. Panning at 200° F.; 3. Rolling thoroughly (by machines or otherwise); 4. Expressing the juices by means of the hands or a press.

Second day—5. Slight evaporation of juices in the sun, or artificially; 6. Drying on the pan at 180°, gradually cooling the pan as the process proceeds; 7. Picking out stalks and coarse leaf.

Third day—8. Winnowing and sifting; 9. Packing.

Green Tea—Process No. 2.

First day and night—1. Plucking the leaf; 2. Roasting; 3. Rolling.

Second day—4. Exposure to the snn; 5. Rolling on trays meanwhile; 6. Drying over charcoal fires if still wet; 7. Fermentation on pans at 150°, gradually cooling to 130°; 8. Sifting and classifying.

Third day—9. Final drying on cool pan, to ohtain color; 10. Pack hot.

Black Tea—Process No. 1.

1. Plncking leaf; 2. Spreading out thinly; 3. Exposure to sun and air; 4. Panning; 5. Rolling; 6. Exposure to air until completion of rolling; 7. Fermentation; 8. Spreading thinly to partially dry; 9. Final drying over charcoal; 10. Picking, sifting, etc.; 11. Packing.

Black Tea—Process No. 2.

First day and night—1. Plucking the leaves; 2. Spreading out thickly.

Second day and night—3. Exposure to air and tossing; 4. Panning at 180° or 200°; 5. Rolling and exposure to air; 6. Panning at 160°; 7. Rolling; 8. Spreading out thinly.

Third day and night—9. Partial drying in sun or otherwise; 10. Picking coarse leaf, etc; 11. Final drying over charcoal fires.

Forth day—12. Sifting, separating, winnowing, etc; 13. Packing.

Very many other methods are in vogne, according to climate and the kind of tea required.

JAMES MACPHERSON,
4 Stoneleigh Villas, Erith, Kent, Eng.

James Davenport Whelpley.

The subject of the following sketch was for several years a resident of California, where he found many warm friends, who deeply deplore his death, several of whom have desired to see the following tribute to his memory appear in a California paper:

On Monday, April 17, there died in Boston, one of the most remarkable Americans who have contribnted to the thought of the present century. Descended from the leader of the New Haven colony, and inheriting those qnalitiee which made one ancestor a martyr for the canee of the church, universal and catholic, and another a seeker for liberty of conscience in the wilde of the new world; learned in all the exact sciences, and an accomplished reasoner from facts; of varied experience as a journalist, a politician, a leader of a colony, an inventor and a scientist, a most fascinating conversationalist, an exact thinker, a wonderfnl man in every respect, his life still failed of being a success to himself or to the world, jndged as the world judges.

But the prophet is a mystery to the ordinary man, and hie life must be measured by the "prophet'a reed," and not by the ordinary measure of men. He lived, a eearcher after truth—he lived, a student of the exact sciences,—ho lived, a collector of material for a great work he was always promising himself to pnblish. And to this end he had bent all the energiea and love and hope of his life, and to this end all other objects and aims, the fruition of ordinary hopes were but means. No snccess wae a finality to him becanse there was this hope in the future; no disaster could depress, for this hope always remained. A physician by profession, his technical knowledge was only a broad fonndation of physiological atudy. A trained and practical geologist and mining engineer, his profound knowledge was only a stone in the bnilding he was hoping to construct. A chemist who anticipated the dednctions of Gerhardt by a dozen years, the chemical knowledge was only a solution of some problems of the arcannm, which gave rise to new questiona to be solved. Noted as a controversial writer, a master of the humorous satire which Rabelais and Irving have used so powerfully, of a weird and brilliant imagination and fascinating style as a story writer, this command of English, which would have made him famous if it were his sole possession, was still only a means. His many inventions in mechanics and the arts he looked on, not as resnlte so mnch as incidente, and his life was spent in trying to do more. For ten years an invalid in terrible daily snffering, his brain daily worked his enfeebled body to its ntmost, and he lived almost by sheer strength of will.

His life's work is unfinished. Contribntions to it appear in the papers of the American Academy, in detached newspaper articles, some under his eignature, others not. Bnt he died almost before his material was heaped together. He intended to develop a new theory of evolution of order from chaos, of life from inanition, of spirit from life, and he died before the work was more than begun. In thinking of him hereafter his career mnst be judged by its hopes and intentions and not by its results. And let ns hope that the thought of that active brain, that truly remarkable mind, has not been utterly etilled by death bnt that, as the master workman has among his journeymen, among many craftsmen, some sons of the craft, so the labor of his life may be taken up by loving and loyal hearts and strong and active minds, and that the nnwritten results of his life may still fructify for the nourishment of mankind.

Mining Companies' Reports.

Crown Point Mining Co.

The annnal meeting of the Crown Point Mining Co. was held on the 3d inst., and Trnstees for the ensuing year were elected. Their names will he found in another column. The Secretary's report for the fiscal year ending May 1st was read. The numher of tons of ore extracted was 81,226, at an average cost of $7.09, and 80,567 tons of ore were milled at an average cost of $11.43 per ton. The numher of mills employed in crnshing this ore was fifteen, inclnding the Rhode Island mill helonging to the company. The average of this ore was $43.48, and the total product amounted to the sum of $3,503,633.

The Secretary's report gives the following receipts and expenditures for the fiscal year:

RECEIPTS.	
From bullion	$3,603,633
Miscellsneous sources	2,328
Totsl receipts	$3,505,961
Cash on hsnd, Msy 1st, 1871	94,602
Totsl	$3,600,663
EXPENDITURES.	
Mines, labor snd supplies	$576,670
Mine improvements	66,331
Rhode Island mill—lsbor	109,331
Rhode Island mill—improvements	14,307
Crushing 67,220 tons ore	807,309
General expenses, Gold Hill office, etc	36,369
Legsl expenses	8,400
San Francisco offics expenses, etc	9,171
Discount	2,803
Interest	1,335
Assaying	18,462
Taxes	18,454
Tressure freight	13,647
Real Estate	468
Total expenditures	$1,682,048
Cash, Msy 1st, 1872 $644,607	
Cssh in hands Superintendent 14,008—	658,515
Dividends to stockholders	1,260,500
Total	$3,600,563

The difference between the total receipts and expenditures leaves a surplus of $1,823,913, of which $1,260,000 has heen dishursed as dividends and the remainder carried to the surplus fund, leaving $644,507.09 cash on hand on the 1st of May. The assets of the company, inclnding said cash amount to $895,903, and the liabilities are nominal. The mine has paid out as dividends a total of $105 per share or $1,260,000. Of these dividends five were $10 per share, two $15, and one $25. Since the first of May the largest dividend ever paid by a mining corporation has heen dishnrsed, viz.—$480,000 or $40 per share.

This showing is a very favorable one as the expenses were very small. The average yield of the ore for the year heing $43.48 the mining costing hut $7.09, the crushing $11.43, and the general expenses on the numher of tons crushed $1.53, leaves a profit of $23.05. The operations in the mine during the past month have been retarded hy the water, and hy an accident to the machinery. The capital stock of the company is now $10,000,00 in 100,000 shares.

Mammoth S, M. Co.

This company held their annnal meeting on the 3d inst. and elected trustees for the ensuing year, whose names will he found in another column. The Secretary's report shows the receipts to have heen $10,997.93, of which $7,184.32 were from assessments, $1,539.41 from hullion, and cash on hand in 1871, $2,217.45. The dishursements were $10,339.51, of which the principal items are milling and hauling, $965.25, labor $4,744.75 and general expenses, salaries, etc., $2,276.44. The assessments during the fiscal year only amonnted to 20 cents per share and there are no liabilities.

Yule Gravel M. Co.

The Yule Gravel Mining Co. met on the 3d ult. The Secretary's report shows the receipts to have heen $599.24. Nine dividends amounting to $45,000 were disbursed by the company and other expenses were $13,853, leaving $1,400 on hand.

The Institute of Mining Engineers.

The Institnte of Mining Engineers has elected the following officere for the coming year:

President, Rossiter W. Raymond, New York; Secretary, Martin Corryell, Pennsylvania; Treasnrer, J. Prior, Pennsylvania; Managers: Abraham S. Hewett, New York; G. W. Maynard, Troy; T. M. Drown, Philadelphia, and several others.

Yesterday the members of the organization visited the Stevens Institnte of Technology, in Hoboken, where they were joined by ex-Gov. Ward, Peter Cooper, Prof. Draper, Dr. John Torrey, Prof. Silliman, and a large company of distinguished scientific men. Prof. Henry Morton, Principal of the Institute, received his guests in a hospitable manner, and several hours were spent in examining the commodious new building and the valnable collection of apparatus which the Institute possesses. The workshops, laboratories, and lecture-rooms, aside from the excellence of their construction, have every appliance for facilitating stndy. Although the Institute has not yet been open eight months, it has already 21 students.

In the evening the members reassembled at the rooms of the Geographical Society, Cooper Institute, when Prof. R. W. Raymond of New York read, in substance as follows, on the "Eureka (Nevada) and other Base Metal Districts of the West:"

"The Eureka District stands now third in rank of the silver producing camps of Nevada. During the most of the year four and sometimes five furnaces (combinations of the Rachette and Piltz) have been in blast. Late last year, and in the earlier months of the present year, the Eureka Consolidated Mining Company discovered immensely valnable and extensive bodies of ore in the Lawton tnnnel. Ruby Hill is a spur of the diamond range. The openings of the Eureka Consolidated as well as those of the Richmond and Tip-Top are on the western, and the new ones on the eastern slope. The strike of the ore body is nearly east and west, and its dip abont 45 degrees to the northeast. For this reason ore was first discovered on the western slope of the hill, where the vein crops out. The Lawton tnnnel is now in over 600 feet, and passes 120 feet to the north of the Keyes shaft, between it and the windsail shaft. At its end it is in ore. The Keyes shaft is now 175 deep, and serves as the main hoisting shaft for the old works. These are the largest extent in quartzite. The approach to the vein matter is distinguished by a yellow color of the first dense, afterward broken, limestone; next by a stronger impregnation of pulverulent brown and yellow iron ore and stripes of the first; finally, the ore body proper—brown iron ore, with impregnations and bands of carbonate of lead or lead ocher, is reached. While on the western slope, beside the yellow memetele, large masses of solid carbonate of lead, with so-called 'black carbonate,' whoh is probably a new mineral, and little galena were found. The oree encountered on the eastern slope in iron-stained masses, which are poorer in lead, are principally highly argentiferous galena and 'black carbonate' in lumps and nests of often over 100 ponnds weight. For this reason there is now much more base bnllion prodnced than formerly. Seven tons of ore now produce one ton of lead, while formerly it required 10 to 12 tons. At Richmond the best and most profitable smelting works in the State are building energetically. All signs point to the enormous industrial increase dnring the coming year, especially if capitalists should take up the Prospect Hill mines. The total prodnct of bnllion of the Eureka Consolidated, during 1871, was abont 3,172 tons. The average contents in gold and silver for the whole yearly product may be estimated as $250 per ton. Adding $100 per ton for the lead we have a gross vàlue of $1,110,314.10. The gross valne of the total productions of gold, silver, and lead, dnring 1871 by the varions companies, including the Eureka Consolidated in Eureka, was $2,035,588.86; the total qnantity of bullion shipped, 5,665 tons, 1,074 pounds. All the base metal mines in the district have the same character as those previously described, and vary less in the classes of ores occurring in them than in the size of the ore bodies."

Prof. Raymond then read a paper, snbmitted by R. H. Terlmne of Chicago, on "Malleable Cast Iron." Papers were also read on "Peckham's Improvement in Forge Firee and Furnaces," by George W. Maynard, and on "The New Mining Law," by Prof. Raymond. The Institute is nominally adjourned until October, when it will meet again in Pittsburgh; bnt today several members will visit the East river caissons and the Hell Gate works.—*N. Y. Tribune*, May 24.

Important Mining Decision.

Commisioner Drummond, of the Land Office Department, has jnst rendered an important deci sion touching qnestions of conflict on the the Cometock lode, State of Nevada. The Gold and Silver Mining Company have made application for a patent, which was protested by the Chollar-Potosi and Bullion Companies lying immediately east of the Julia claim, which protest was overruled and the patent issued.

The Chollar Company claimed that the lodes upon which the Julia was located were "parts and parcels of the Comstock lode," and belonged to the Chollar Company by virtne of its patent, issued February 4, 1870. The Commissioner says there is nothing to show that the surface claims conflict and that the objections are based rather on a contingency which may hereafter occur, than anything at present definite or tangible; but as this can only be determined by future developments, the wisdom and justice is not perceived of indefinitely snspending the execution of the United States Mining lawe on any claims which may be in the neighborhood of either the Comstock or any lode, to await such future event. Should the veins eventnally unite, he points to the remedy in the Mining Law, which declares "that where two or more veins nnite, the oldest or prior location shall take the vein below the point of nnion, including all the space of intersection;" by which clause, he says, the Chollar Company would be fully invested with title to the lode below the point of union, but that their claim to the veins claimed by the Jnlia Company above the point of intersection, is not recognized by the statute.

A RECENT issue of the London *Mining Journal* records the trial of a new form of stamping machinery, which professes to economize greatly in consumption of fuel, to he exceedingly efficacious in work, and to be of comparatively small original cost. A working experiment was made with this new machinery—which appears to he an adaptation and modification of the Nasmyth hammer—with a view of determining its usefulness for purposes of tin ore crushing, the trial being made at the West Wheal Jewell. The head of the stamp is fixed to a piston-rod and works by direct action, the steam heing conveyed through a steam pipe from the boiler. In the experiments to which we allude, the stamps worked at the rate of 110 strokes per minute, and one head crushed one hundred weight of hard tinstone in a little less than four minutes; hut the inventor claims that the stamps will work at the rate of 120 strokes per minute nnder ordinarily favorable circumstances, and crush twenty-four tons per head a day. The hammer-heads are much larger than the old stamps, measuring eighteen inches by eight, and the piston-rod and hammer together weigh about eight hundred weight. The force of the stroke, with medium pressure, is from thirty to thirty-five hundred weight

AN "INTERNATIONAL LABORATORY."—In connection with the grand Vienna Exposition to be held next year, Prof. Lielegg calls attention in the *Ill. Exposition Journal* (for copies of which we are indebted to C. J. Schultze of Pesth) to the so-called *Laboratoire international* of the Paris Exposition. The object of this institution, which did not attract the attention it merited, was to enable visitors to obtain a better knowledge and form a better judgement of the merits of exhibited articles than could be obtained by mere inspection. The object was most praiseworthy although not attained in the highest degree. Still it gave much precious teaching to the visitor. For example, the experiments in melting large amounts of platinnm by means of Deville's apparatns, and of gold, silver, copper and iron with the oxyhydric apparatns of Ibiesnegg, were o ten carried out; Girond'e preesure regulator for gas was pnt in operation; Dubosq made experiments with the spectroscope and the photometer; and Limousin explained and illustrated the harmless method of preparing oxygen for inhalation from chlorate of potash. It is to be hoped that at Vienna some snch plan may be carried ont on a large scale; for the "international laboratory" can be made one of the most interesting features, at least to men of science, of the Exposition.

THE topography of Vesnvius is reported to be completely changed since the eruption. A correspondent writing from Naples, says: "It is as though an earthqnake had altered everything. Hills have appeared where, but a few days ago, stones stood for visitors to rest npon. Precipices have been formed, which almost prevent further advance. All is altered; the very shape ot the monntain has lost its well-known ontlines, and the view is appalling.

TWENTY-FIVE miles an hour is shown hy signal service observation, to ho the average velocity of a storm; when it has twice that velocity it hecomes a tornado.

Scientific Progress.

A Waning Star.

In our last issue we made reference to the disappearance of the star, Eta Leonis [the printer made us say Mu Leouis]. Since that paragraph appeared we have seen a note from Geo. Madeira, of Santa Cruz, who, having examined this star with, probably, a more powerful telescope than the San Francisco observer, reports that on the 1st instant it was fast diminishing in brilliancy but had not at that time disappeared entirely. Mr. M. promises to continue his observations for a few weeks and give the public an account of the same.

Such phenomena as the disappearance of a star or any variation in a star which has hitherto maintained a permanent degree of luminosity, are of very rare occurrence and perhaps, a short reference to the more noted phenomena of this kind which have heretofore been noticed may be appropriate in connection with the one which is now attracting the attention of astronomers.

During the last 2,000 years there have been noticed some 20 "temporary stars," which have suddenly made their appearance in the heavens only to blaze out or flicker awhile and finally to disappear entirely.

Of the variable stars, which increase and diminish their light periodically, only about 24 have been thus far recorded.

The first variable star, Mira in the constellation, *Cetus*, was noticed in 1596. Subsequent observations have shown that this star has a periodicity of about 332 days, during which time it increases from total obscurity to a star of the second magnitude. When decreasing, it changes its color from white to red.

Seventy-three years afterwards, the noted star Argol (the demon star) was observed to be variable. It passes through its variations from the 2d to the 4th magnitude, and *vice versa*, every sixty-eight hours.

The star Cephas, makes its changes from 3d to 5th magnitude, in about 5½ days.

The most wonderful of the temporary stars, was seen in 1572. It appeared suddenly in the constellation, *Cassiopea*, and very soon reached the brightness of Sirius, after which it increased in brilliancy until it surpassed even Jupiter or Venus, and could even be seen in the day-time. Its period of increase was about one month; but its period of waning was very gradual—lasting about fifteen months. This star was first white, then red and finally white again.

Some astronomers think that this is a variable star of long period—about 313 years, from the fact that a similar appearance was observed in the same portion of the heavens in 945 and again in 1264. Its authentic appearance having been in 1572, if the surmise of its periodicity is correct its next appearance will be in 1885.

The most remarkable temporary star of recent times was the one which suddenly blazed out with a brilliancy of the 2d magnitude, on the 12th of May, 1866, in the constellation of the *Corona Borealis*. In its place, previously, had been recorded a telescopic star of the 10th magnitude. The sudden appearance of this star created quite an excitement in the scientific world. It was carefully investigated by Huggins with the spectroscope, who arrived at the conclusion that the star owed its sudden brightness to the evolution of flaming hydrogen. It was naturally supposed that such an active conflagration of that matter could not be of long continuance, and that its excessive brilliancy would soon fade away; a prediction which was fully verified, as the hydrogen lines disappeared in the spectrum in about eight days. It rapidly waned to the 6th magnitude, and more gradually from that to the 10th—its original record. Since 1868 it fluctuates slightly, but singularly, unlike the ordinary variable stars. In 1870 it was of the 7th magnitude, and now it shines with the 8th.

The variations of the periodically variable stars are generally thought to be due to the fact that they are double stars, revolving around a common center—one being brighter than the other. In cases of total temporary disappearance, one star may be totally devoid of light. Again "sun spots" may in some cases account for the phenomena of waxing and waning. In that sense the center of our solar system—the sun— is a periodically variable star of eleven years time—that being the period of its presentation of a greater or less number of "sun-spots."

With the later improvements and better understanding of the spectroscope, great advance is now being made in astronomical knowledge—particularly in relation to the physical condition of the heavenly bodies. Spectroscopic observations on the star Eta, which just now seems to be gradually flickering itself out of our view, will be looked for with much interest.

The Crystallization of Iron and Steel.—The various qualities of iron and steel may be compared by observing the forms of their crystals through a microscope. Cast steel of fine quality exhibits fine crystals of a needle-like shape parallel to each other; and the axes of these crystals are in the direction of the hammering to which the metal has been subjected. The surface of iron exhibits crystals of the shape of a double pyramid, the proportions varying with the quality of the metal. The pyramids more nearly approach a cubical form as the carbon in the metal is increased in quantity.

Measuring the Light of Stars.

Zoelner, of Berlin, has recently made an important addition to the means by which the astronomer seeks to measure the degree of light emitted from a star. The small quantity of light which reaches us from these distant bodies, renders the task of measuring the same by the instruments heretofore in use extremely difficult. The invention of Mr. Z., is a polariscope connected with a telescope. By this instrument, a ray of light is made to disappear and reappear alternately, by simply turning an eye-piece of Iceland spar around its axis, through an angle of 90°. This disappearance and reappearance is gradual, and the angle of rotation from 0° to 90°, may therefore be used as a measure of the intensity of the light—the stronger the light, the greater the rotation required to be toned down to a certain standard. Important results have already been obtained by the use of this instrument.

One of the most important results of this instrument, is the power which it gives of more accurately determining the periods of the variable stars. Heretofore it has been so difficult to measure the intensity of the light from a star, it was quite impossible to detect with even much approximate accuracy, the precise time occupied by a star in passing from its period of least light through its gradual increase and subsequent decrease of light, again to its point of least brilliancy.

Rosthornite, a New Fossil Resin.—A new fossil resin, named rosthornite, is described by Höfer as occuring in the coal of the Sonneberg, in Cariuthia. This has a fatty lustre, a brown color with garnet-red gloss, wine-yellow by transmitted light, and a light brown to orange yellow streak. When heated in the air it gives off white vapors having an aromatic odor, and burns with a smoky flame without leaving any residue. In chemical composition this mineral approaches most nearly to enosmite, and still more to the fossil resin of Girona, in New Grenada. This substance can not be properly assigned to any of the groups already established among the fossil resins, but seems rather to conform to the type of a solid resin, rich in carbon but poor in oxygen.

The spectrum of hydrogen has been recently made the subject of experiment by Prof. Angstrom; he states that it presents only four lines, and considers that the other spectra that have been given are in error from the presence of impurities. He also examined the spectra of atmospheric air under different degrees of rarefaction, and found that at first it was that of air; then of nitrogen; then of carbonic oxide; and when the exhaustion had reached its utmost limit the spectrum obtained was that of sodium and chlorine.

Coating Metals with Nickel by the Moist Way.—According to C. Mene, wrought and cast-iron, steel, copper, brass, zinc, and lead can be coated with nickel by putting these metals, or objects made of them, in a boiling neutral solution of chloride of zinc, to which a salt of nickel is added, and also zinc, in a granulated state or in sheets. If the solution be acid the coating will be dull. When, instead of a salt of nickel, one of cobalt be used, a coating of that metal may be obtained.

Marvels of the Microscope.—A beautiful and easily produced exhibition of crystal formation may be seen under the microscope as follows: Upon a slip of glass place a drop of liquid chloride of gold or nitrate of silver, with a particle of zinc in the gold and copper in the silver. A growth of exquisite gold or silver ferns will vegetate under the observer's eye.

A Society of Arts, Sciences and Letters, has just been started at Winona, Minn., in connection with the first State Normal School in that place, having for its object the collection of facts and materials looking toward the determination of the natural history, archæology, and general literature of the United States.

Another Singing Flame.—At a late session of the Philosophical Society of Glasgow, held lately, Dr. A. Irvine showed some experiments on a new variety of singing flame, and described and experimented with a new miner's safety-lamp, which involves the application of that flame. The experiments excited a great amount of interest among the members.

Artifical Musk.—Prof. Vander Weyde, at a late meeting of the Polytechnic Association of the American Institute exhibited an artificial musk, made by treating blood in a peculiar manner. By adding little hairs, such as are found in genuine musks, the deception is so complete that it cannot be detected even by the microscope.

Weather Predictions.—President Tillman, of the Polytechnic Association of the American Institute, says the weather predictions which are daily published in our newspapers have been verified to about 75 per cent.; that is, three-fourths of all the predictions which they have made have been found to be true.

The British Society for the Advancement of Art still offer the $5,000 reward for a pigment or covering which will perfectly protect iron from rust and fouling.

M. Champoulion avers that putrifaction is much more rapid in the dead bodies of those who have used alcohol to excess than in those of comparatively sober individuals.

Mechanical Progress.

Granite Works of the Ancients.

The following, from an exceedingly interesting account of the colossal granite structures of ancient Egypt, India and South America, appears in the current number of the *People's Magazine*:—

The art of carving in granite has never been carried to higher perfection than on the continent of India. At Chillambaram, also in the Carnatic, and on the Coromandel coast, is a congeries of temples, representing the sacred Mount of Meru. Here are seven lofty walls, one within the other, round the central quadrangle, and as many pyramidal gateways in the midst of each side, which form the limbs of a vast cross; consisting altogether of twenty-eight pyramids. There are consequently fourteen in a line, which extend more than a mile in one continuous direction! Nor are these the only wonders associated with this metropolis of pyramids. The interior ornaments are in harmony with the whole; from the nave of one of the principal structures there hang, on the tops of four buttresses, festoons of chains, in length about 548 feet. Each garland, consisting of twenty links, is made of one piece of granite, sixty feet long; the links themselves are monstrous rings, thirty-two inches in circumference, and polished as smooth as glass.

Compared with the monolith temples of granite at Mahabalipuram, which is likewise situated on the Coromandel coast, those in Egypt sink into insignificance. The rocks thereabouts are composed of a hard gray granite, containing quartz, mica, and feldspar, with a few crystals of hornblende interspersed. Many have been hollowed out by art, and sculptured into temples with spirited bas-reliefs, representing episodes in Hindoo history and mythology, and supported by graceful columns; all carved from the solid rock. Detached masses have been cut into shapes of elephants, tigers, lions, bulls, cats, monkeys, and various nondescript monsters, and colossal statues of gods, one of which; namely, that of Ganesa, being thirty feet high.

"The southernmost of the temples is about 40 ft. in hight, 27 ft. in breadth, and nearly the same in length; the exterior being covered with elaborate sculptures. The adjoining edifice is about 49 ft. in length, and in breadth 25 ft.; it is rent by natural causes from summit to base. According to the local Brahminical tradition, these wonderful sculptures were executed by 4,000 workmen, who had come from the north, and returned before their completion. From a careful examination, it is evident that almost all the enormous mass of sculpture and carving that adorns this city of monolith temples and colossi, must have been performed without the aid of fire—with the hammer, chisel, lever, and wedge alone; and this is one of the hardest rocks in the world?"

A Short Coal Supply.—A correspondent in *Engineering* says that almost any price can be had for coals in the north of England, by those who are fortunate enough to have any for sale. The demand is so heavy that the additions which are being made to pits, and the new pits which are being sunk, seem to go but a very little way in meeting the extra requirements of consumers. Everybody is crying out for more fuel, and, do what they will, they cannot get it quick enough. To meet this extraordinary increasing demand, hand labor is inadequate. Good coal-cutting machines must be forthcoming. The attention of a great many engineers are directed to this question of coal cutting, and, in this age of invention, it will be remarkable if suitable machines are not soon introduced. Unless machines are applied to coal-cutting, there is not the slightest doubt that the iron trade and other industries will be crippled in their development for want of fuel. Coal being scarcer, there is, of course, the greatest difficulty in obtaining coke.

Artificial Leather.—Among the different kinds of artificial leather lately introduced, is the following:—J. Charles, in London, and C. Taylor, in Manchester, England, take boiled linseed-oil, and boil it again with quicklime and borax, till they obtain a finid, which, by cooling, nearly solidifiss into a thick dough. To this they add pulverized cork, and some quicklime, and the paste obtained is rolled out into sheets, which, if desired to be very smooth, after being dried, and rubbed down by means of pumice-stone. The process is evidently a partial sponification, and reminds us of the artificial India rubber, which is also made of linseed-oil, without the addition of the powdered cork, which serves only to give the appearance of leather, and is a mere filling or adulteration of the tenacious chief ingredient, in the same way as India rubber is adulterated by similar fillings.

Puddling Furnaces in Great Britain.—There are about 7,800 puddling furnaces in Great Britain, employing 26,000 men, involving an investment of over $5,000,000. All these furnaces are now worked by hand, or at least with but trifling help from mechanical device. It is expected that a revolution will soon be wrought out with this immense industry, by use of the mechanical puddlers, which have already been proven successful in their application.

Improvement of the Steam Engine.

In a paper read before the Polytechnic Association of the American institute by Professor Thurston, on the above subject, he summed up his conclusions in the following statements:

The direction which improvement seems now to be taking, and the proper direction, as indicated by an examination of the principles of science, as well as by our review of the steps already taken, seem to be:

Steam must enter the machine at the highest possible temperature, must be protected from waste, and must retain, at the moment before exhaust, the least possible amount of heat. He whose inventive genius of mechanical skill contributes to effect either this use of highest steam with safety and without waste, or the reduction of the temperature of discharge, confers a boon upon mankind.

In detail: *In the engine*, the tendency is, and may probably be expected to continue, in the near future at least, toward higher steam pressure, greater expansion in more than one cylinder, steam jacketing, superheating, a careful use of non-conducting protectors against waste, and the adoption of higher piston speeds.

In the boiler, more complete combustion without success of air passing through the furnace and more thorough absorption of heat from the furnace gases. The latter, I am inclined to suppose, will be ultimately effected by the use of a mechanically produced draught, in place of the far more wasteful method of obtaining it by the expenditure of heat in the chimney.

In construction, we may anticipate the use of better materials and more careful workmanship especially in the boilsr, and much improvement in forms and proportions of details.

In management, there is a wide field for improvement, which improvement we may feel assured will rapidly take place, as it has now become well understood that great care, skill and intelligence are important essentials to the economical management of the steam engine and that they repay liberally all of the expense in time and money that are requisite to secure them.

A New Kind of Flint-Glass.—Dr. Benrath, Director of the glassworks at Dorpat, Russia, publishes an account of experiments made by him to produce a glass which has the good qualities of flint-glass without its defects. The good qualities of ordinary flint-glass are, that it is as clear as crystal; that it has a high specific gravity, (is heavy;) a low fusing point, so that it melts easily; and strong power of refraction and dispersing light. It is, therefore, invaluable for chemical and optical purposes. Its defects, however, are that it is easily acted on by chemical and mechanical influences—that means its surface cannot stand rain and sunshine, much less acids or boiling water, and it is so soft that it is most easily scratched.

The chemical difference between ordinary and flint-glass is that the former consists of silex, lime, and soda or potash, while oxide of lead is added to make flint-glass out of it. Chemically speaking, common glass is a silicate of lime and potash; while flint-glass contains also silicate of lead.

Cutting Marble.—A recently devised foreign apparatus for stone-cutting uses comprises a head that can be rapidly rotated and provided with diamond cutters, so arranged that while each cutter removes material and traces a path over the moulded surface to be produced, all the cutters produce wrought surfaces free from distinct scratches. For cutting mostly on a horizontal face, the head is solid in which the diamonds are mounted. For moulding on an edge, the cutterbead holds bits of steel studded with black diamonds. A rotary tool is shaped to finish the groove, and preferably formed of brass. For cutting as with a saw into marble a small round vertical spindle is used, the surface of which is studded with black diamonds or carbon points, so arranged in rows that the cutting points of the different rows merge their paths of action, so as to cut the whole length of the cutting plane of the shaft.

Imitation Leather.—For producing imitation morrocco or other leather, a foreign exchange recommends a composition consisting of one pound of glue to five liquid ounces of glycerine, boiled linseed oil being added for flexibility, or India rubber for elasticity, together with the coloring matter. The composition is spread while hot upon the fabric, and impressed with the design. The hardened impressed surface is treated with a solution of alum or chromo or other alum, or with a solution of sulphate of iron, copper or zinc. The alum or sulphates may be mixed with the composition before it is spread. The surface is protected by varnish or waterproof composition, and ornamented by gold, bronze, or other coloring material.

The Henderson Iron Process.—Samples of iron made by the Henderson fluorspar process have recently been tested in England. The breaking strength was found to be 28 tons per square inch, the Government Standard being 22 tons.

The unusual activity in the British iron market still continues. The proprietors of iron and coal mines are reaping a rich harvest.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

AMADOR COUNTY.

OLEAN-UP.— Jackson *Ledger*, June 8: The Kennedy has made a run of 16 days and cleaned up over $11,000. The rock heing taken out is improving in richness and the ledge is expanding.

PLYMOUTH.—Cor. same: The Phoenix is yielding very rich ore. On the 600 ft. level a ledge has heen opened 20 ft. thick. The Co. have 3,000 tons of rock ou their dump which is daily increasing. They have commenced work on a new 20-stamp mill to he propelled by water power.

The Alpine, idle for a week repairing machinery, started np on Saturday.

Work has been suspended on the Condo and Wilson mine near Enterprise. The last run of 100 tons, worked, paid aomething over $15 per ton.

The Philadelphia mine is rnnning on low grade ore.

A one-half interest in the Arastra mine has recently been sold and the owners will erect a 10-atamp mill npon it in a few weeks.

BUTTE COUNTY.

FORBESTOWN.—Cor. Oroville *Record*, June 8: The quartz mill is running.

Murch & Gwynn cleaned up 360 ozs. a few days since, among which they had many nuggets varying in size, from 27 ounces down to one.

Hunter & Co., in their drifting claim, are getting dirt in which the gold is distinctly seen.

CALAVERAS COUNTY.

THORN MINE.—San Andreas *Citizen*, June 8: The shaft is down about 260 ft. with a steady improvement in the character of the rock.

ANGELS.—Cor. same: Yesterday there was taken out from the 500 ft. level in the "Big mine," some of the richest rock ever found in that mine. The same day J. Mattison shoveled $1,500 out of his mine. Last week he found a lump of gold there that weighs 7 ounces, also dirt that prospected $5 to the pan.

THE GRASSHOPTER.—Calaveras *Chronicle*, June 8: New hoisting works are to be immediately erected on the mine at Mosquito Gulch.

SAN BRUNO.—The recent cave in the San Bruno mine Mosquito Gulch, was not so extensive as feared.

EL DORADO COUNTY.

EL DORADO.–Cor. Placerville *Republican*, June 6: A very rich porphyry lode has heen struck struck north-west of town ahout a mile. Several claims are being worked there, and all doing well. One party of two, took out last week nearly $1,000.

INYO COUNTY.

BULLION. — Inyo *Independent*, June 1: May 9th there were shipped from Hisky & Walker's mill 5 hars valued at $2,400. Also May 23, 9 hars valued at $4,700.

STARTEN. — The Eclipse mill is now nnder way.

CERRO GORDO.—A strike is reported in McDonough's mine. All the furnaces are in operation producing 300 tons of hullion per month.

LIDA VALLEY.—The Lida Belle is down 55 ft. Four tons of of this ore recently worked netted the owners $1,938.10 over all expenses. The Brown's Hope has a shaft of 45 ft. showing a widening vein of 14 inches of exceedingly rich ore. The Simon Pure shows a ledge 10 inches wide, from which a small lot of ore worked $1,103 in silver and $100 in gold per ton. The Lida Hill shows a ledge 4 ft. wide 10 inches heing of the highest grade; has heen sunk upon 15 ft. The Sewana produced rock which worked $1,100 per ton. Other locations are doing equally well.

KERN COUNTY.

WANTED.—Havilah *Miner*, June 1: Laborers and minera are iu great demand in this county.

STRIKE.—From information received from miners from the Pi Ute mountain, we learn that the owners of the Bright Star mine have struck the precious metal richer than they ever dreamed of. A hody of ore estimated at the lowest calculation to he worth $500,000 is in sight; 10 atampa will be added to the old mill, making 15 in all. It will be kept running day and night

MARIPOSA COUNTY.

RICH.—Mariposa *Gazeette*, June 7: The Poor Mine, is proapecting, hetter than ever. Ore was struck a few days ago, which is estimated to pay 500 per ton.

NEVADA COUNTY.

STRIKE.—Nevada *Transcript*, June 8: S. M. Timmons ahowed us a specimen of quartz yesterday. He aaw on the dumps about $2,000 worth of the same kind of rock. The ledge is ahout 4 ft. thick, and previous to the strike of the rich strata of gold, the ledge has heeu paying well.

CHALK BLUFF.—Duryea & Co., Hussey & Co., and a number of other Co's., are working day and night.

Chas. McElvy and J. Earl Brown, are working the Old King claims with splendid prospects.

At Yon Bet, the English Co. are cleaning up about $9,000 per month, above expenses.

WYOMING—The last crushing yielded over $27 per ton; the Co. have 125 tons of rock on the surface worth about $30 per ton.

PENNSYLVANIA.—G. V. *Union*, June 4: The mines are down 250 ft. in splendid ore. They have drifted 350 ft. on the fifth level. The ledge is ahout 2½ ft., and the rock will yield at least $50 per ton.

SAN LUIS OBISPO COUNTY.

THE QUICKSILVER MINES.—San Luis Obispo *Tribune*, June 1: In the Keystone they have 185 ft. stripped, exposing to view a ledge of cinnahar 18 ft. wide. They have sunk a shaft 30 ft., and as the depth increases so also the richness of the ore.

SIERRA COUNTY.

HOG CANYON.—Downieville *Messenger*, June 1st: Falk Bros. have recently struck a large hody of finc ore.

RICH CROPPINGS.—Parties working at the Reis Mine, stumbled upon the croppings of a quartz ledge which promises to he very rich. One man with a hand mortar makes $6 per day.

Nevada.

EUREKA DISTRICT.

RICH.—Eureka *Sentinel*, June 6: A splendid development has lately beeu made in the lower workings of the Wide West shaft of the Adams Hill mine.

RUNNING FINELY.—The Phenix hoisting works are running finely. Every part of the machinery works to perfection.

FOURTH OF JULY MINE.—The main incline is down 160 ft., showing a fine ledge, averaging ahout 4 ft. in width, for the entire depth. In the lower workings the ledge averages something near 7 ft. There are 500 tons of ore on the dump and there are not less than 5,000 tons in sight in the mine. The average assays throughout the mine are $160 per ton. From 40 to 50 tons of ore will then be taken out daily.

ROBT. EMMET.—A shaft is down about 50 ft., disclosing a ledge from 2 to 3 ft. wide. Seven tons lately worked yielded $327.52 in silver per ton, and $62.79 in gold. There are about 75 tons of the same character of ore on the dump.

ELY DISTRICT.

BULLION.—Ely *Record*, June 2: W., F. & Co. shipped for the week ending June 1st, bullion valued at $101,063.84, and from May 1st to June 1st, inclusive, $508,276.61.

CHIEF OF THE HILL.—The west drift is in 24 ft. from the winze with the ledge showing 5 ft. between the wall, carrying a heavy hody of fine mineral, free from quartz or waste of any kind. The east drift is in 46 ft., with ledge carrying 18 inches of good ore next the ft. wall. At present raising from first level to the surface for fresh air. On dumps at present about 225 tons of high grade ore, which will mill on au average $130 per ton.

MEANOW VALLEY.—Shipping nsual quantity of ore to mill, and mine looking well in the different workings.

LOUISE.—Anna Dickinson shaft down 45 ft. with a small vein of fine ore in the hottom. Ellen Goodspeed and Grattan shafts looking exceedingly well and showing fine mineral throughout. The Goodspeed shows 20 inches of good ore, which will prohahly average $125 per ton after milling.

EXCELSIOR. — Raising ore aud preparing to stope from the hottom level. On Weduesday last struck into a fine hody of ore in the upper drift.

SPRING MOUNTAIN TUNNEL.—Work has heen temporarily suspended on the drifts from the station in winze sunk on first ledge, owing to the air being very had.

NEWARK.—Shaft down 400 feet, with ledge showing 2 ft. in width on the hottom. Ore from the new strike assays from $153 to $1,100.

PARIAN.—Situate ahout half a mile west of the Court House, is 3 ft. in width. One shaft has heen sunk 40 ft., and four or five others, for proapectiug purposes, are from 8 to 12 feet. Asaays of ore from the ledge run from $50 to $125.

SETTING SUN.—Shaft down 55 ft. On Thursday night last, a hody of ore was struck in the hottom, 10 inches in width, and carrying yellow chlorides throughout.

SUNBEAM.—Shaft down 200 ft. On Friday night struck into casings in the face of the drift and have good indications of aoon tapping the ledge, which was passed through in sinking.

NORFOLK.—Shaft down 170 ft. Still sinking on ledge, which is 5¾ ft. wide in the bottom. Ore aaaays on average from $50 to $150.

REESE RIVER.

GROVE TUNNEL.— Reese River *Reveille*, June 1: Lookiug well in both east and west levels.

DOLLARHIDE INCLINE.—The cross-cut reached the ledge this week, hut found it in the hreak.

ISABELLA. —At the O'Connel ledge, Goldaworthy and Roherts have just got into an apparently extensive hody of rich ore.

WEST TROY.—The hody of ore atruck some two weeks ago, "petered out," hut the hoys are going ahead with their work.

SAYBROOK.—The 150-foot east level is in 45 ft.; considerable fair ore coming out, some of it first-clasa.

STAR OF NEVADA.—A crosa-cut which is being run from the Star of Nevada level to tap the Hazel Green ledge, exposed a hlind ledge last week, which is from 6 to 8 inches wide, and looks promising.

MORGAN AND MUNCEY.—Breasting at the 310-ft. east level in a big ledge of $300 ore; struck a ledge last week at the 200-ft. east level which carries four inchea of from $700 to $800 ore; ainking the incline; have a good deal of water.

FLORIDA.—Brcaating at the 300-ft. east level, and at the 200-ft east level; gettiug some average ore; work continues at the 500-ft. west level at which point the ledge is harren.

SARATOGA.—If anything, better than ever.

WHITLATCH UNION.—Reed and Co. are breasting out a large body of ore, of which there must be fully 100 tons.

IRONCLAD.—The incline is 120 ft. deep showing good rock at the hottom.

SAM BRANNAN.—The 150-ft west level is in 30 ft. in good ore; west level in 35 ft., getting high grade ore; nothing doing at present in the incline.

MANHATTAN.—This mill is still running night and day and has a large lot of ore on hand. The old hattery of 20 stamps will soon he replaced by one of 24,900 lb. stamps.

YANKEE BLADE ENSIGN.—Sinking the shaft; getting good ore; ledge one foot thick.

KLING AND KELLY.—raising a shute from the main shaft to the air shaft, for ventilation.

STONEWALL.—Bowen & Co. are running a level from their shaft at a depth of 69 ft.; taking out about $300 chloride.

PATRIOT.—McCann still taking out good ore; ledge about 6 inches wide.

VIRGINIA.—Getting good chloride from a point about a hundred feet down the incline.

OPLEY STEINACHER & CO.—$200 ore is coming from the tunnel of this Co; mine looks Well.

MORSE & CABLE.—The last lot of ore worked went $900 per ton; work is atill progressing on the tunnel.

SOUTHALL & Co. are getting good oro from the surface. Turner & Co. are also getting a good grade of surface ore.

WASHOE.

BULLION.—Reno *Crescent*, June 1: The crop passing through W. F. & Co's Reno office for the week ending Friday night last, amounted to 14,790 lbs.

LADY BRYAN.—Work is to be resumed. A new shaft is to be sunk further east, which will strike the ledge at its most favorable point for the advantageous extraction of already developed good paying ore bodies.

OCCIDENTAL MILL.—Virginia *Enterprise*, June 1: The Occidental mill is in full and successful operation. It is running ou Savage ore. The lower tunnel of the mine (Occidental) is being pushed northward in order to top the north hody of ore found in the upper levels.

THE Trench mill at Silver city shut down on the 1st, and will probaly not start up again this month.

SAPPHIRE MILL.—This mill, in Lower Gold Hill, is heing thoroughly overhauled and remodeled.

SILVER HILL WORKS.—The frame of the large new hoisting works of the Silver Hill M. Co. is now up.

LOCAL SUMMARY—MCMEANS.—Gold Hill *News*, June 8: The south tunnel is in 85 ft., and the ledge continues to improve in character, width aud assay value. The ledge is about 9 ft. in width.

IMPERIAL-EMPIRE.—Drifting into the ledge at the 1,500-ft. level was resumed ou Weduesday with encouraging indications. The drifts at the 1,650-ft. level are each in ahout 90 ft.

HALE ANN NORCROSS.—A winze is heing sunk between the 1,400 and 1,500-ft. levels, and until this winze shall have been completed the prospecting of the lowest level will he necessarily slow, on account of the imperect ventilation. On the 1,500-ft. level they are cross-cutting the vein at a point 150 ft. from the Savage line. They are also drilling northward on this level on the west side of the vein. This drift is in 116 ft. north of the incline. On the 1,400 ft. level a connection has heen made with the southern working of the Savage mine, securing an ahundance of pure air to the openings at that depth.

THE SAVAGE is yielding 200 tons of good milling ore per day, principally from the ore hodies on the 1,300 and 1,400-ft levels—these bodies of ore still holding out and developing finely. The south drift of the 1,400-ft. level has made connection with the Norcross works, giving a fine circulation of good air. They are atill driving the south drift and east cross-cut, on the 1,500 level.

WOONVILLE.—The daily yield is 30 tons of ore, showing improvement in quality, milling $33 per ton—$3 hetter than last week. In ainking deeper the ahaft has cut more good ore.

OPHIR.—Notwithstanding our report last week that the Ophir would commence sinking their shaft for another level, they have not yet made the commencement, owing to the hreaking of the pump and the delay in getting timber. The prospecting of the 1,100 and 1,200-ft. levels is still prosecuted with the utmost vigor, with no new developments.

In the Gould and Curry the incline is down 60 ft. and making much hetter headway than at our last report. Also driving the north, south and east drifts of the 1,500 ft level with all the force possihle.

BELCHER.—The daily yield of the Belcher is 280 tons, from the 1,100 and 1,000-ft. levels. The connection hetwcen the main incline and the west drift of the 1,100 ft. level will he made in four or five weeks. The new hoisting worka will be ready to start up to-morrow for the first time. Some very rich ore is developed in the 1,200-ft. level within the last few days.

CHOLLAR POTOSI—Daily yield has increased to 200 tons, all from the Blue Wing, Belvidere and other ore-producing sectiona of the old upper workings, the average assays being about $40 to the ton. No new developments.

KENTUCK.—The yield for the month of May was 1,326 tons, assaying about $22 per ton on an average.

CROWN POINT.—The daily yield is 325 tons.

YELLOW JACKET.—Daily yield 20 tons. No new developmenta aa yet.

SIERRA NEVADA.—Daily yield a little over 50 tons. The ore gives a poorer general yield and the main hreasts are not looking or assaying well. A body of ore assaying from $6 to $10 per ton has heen developed hy a drift from the raise above the lower tunnel.

BUCKEYE.—Daily yield 22 tons. The new slopes opened sonth of the incline, at the 400 ft. level, are opening out spleddily, and promise a ledge of good paying ore. Average car samples yield $46 to the ton.

WHITE PINE.

TREASURE HILL MINES—ORIGINAL HIDDEN TREASURE.—White Pine *News*, June 1: Thirty tons of ore are extracted per day. The ore hody in the big chamher has every appearance of proving extensive. The Bonner and Rathhuu chambers are looking well. It is estimated that there is 300 tons of good milliug ore on the dumps.

SOUTH SHEBOYGAN.—The tunnel is in 140 ft.

NORTH AURORA.—The ore hody in the De Pass chamher has increased in quantity since last report. The shaft in the hottom of the chamber, to prove the depth of the ore, is dowu 24 ft. in good ore.

PENNSYLVANIA.—This mine will start up soon.

SAN JUAN DEL RIO.—Work will be resumed soon.

EAST SHEBOYGAN.—The ore in the face of the drift is increasing in size, as work is pushed ahead.

SILVER WAVE.—Blocking out in Boston shaft, and hoisting to dump.

COPPER GLANCE.—An extensive body of fair milling ore in sight.

NOONDAY.—The lode averages about 6 ft. in width, of a fair milling grade.

WARN BEECHER.—Running ore from east end of Phillpotts chamher, to engine shaft.

EBERHARDT.—Shipping ore by tramway to mill.

Colorado.

CARIBOU.—Cor. Central *Register*, May 29: The Carihou, Silver Point, Seven Thirty and Grand View, are hoisting large quanties of rich ore.

Burger & Sons are driving a tunnel in the Boulder Co. Hill on a rich vein of ore.

Lesher & Shaw are working the No Name lode, east of the Caribou, and are taking out some very fine mineral.

Henry Burger has discovered a rich vein of mineral—it is thought to be the east extension of the Seven Thirty.

J. P. Jamison is working the Gentryville lode, ou Carihou Hill. It has every indicatiou of being a valuahle mine.

COLORADO GULCH.—Cor same: The Printer Boy is down in the main shaft about 280 ft., and looks well.

The Pilot and Lincoln Cos. are taking out fair pay. The American Flag looks as well as the hest of the lodes on the hill.

Paul & Co. are about to erect a 20-stamp mill in Iowa Gulch.

WILLIAMSBURG.—Caribou *Post*, June 1: The Washington Aveuue is a mammoth vein, carrying from 2 to 5 ft. of solid galena and zinchlende ore. Au average sample, taken from a pile of 4 tons of first-class ore, assayed at the rate of 260 ozs. of silver per ton. Eastward ahout a mile and a half, Welch & Co. have discovered a lode which they have named the Mayflowcr. At 14 ft. they have a crevice of solid ore 2 ft. in width, very similar in character to that of the Washington Avenue.

Idaho.

LOCAL RECORN.—Silver City *Avalanche*, June 1: The Ellmore and Mahogany are both showing well. The Ellmore hoisting works occasioned considerahle trouble during the past week, which retarded the sinking of the shaft.

THE South Chariot shaft has been repaired to the 4th level, and is in good shape.

J. H. THOMAS, foreman of the North Oro Fino, haa haled the water out of the north shaft, and is sinking to meet the winze coming up from the 3d level drift.

THE Illinois Central hoys have from 70 to 80 tons of fine looking ore on their dump.

WORK will shortly he resumed on the Vass mine.

SUP. PHEBY has commenced sinking the shaft on the Pauper, and is down ahout 8 ft. helow the old working. The ledge is 1 ft. wide and assays as high aa $170 per ton.

SOUTH MOUNTAIN.—Cor. same: The Golconda shaft is down 15 ft. There have heen 4 uew discoveries here within the past 10 days.

Montana.

VIPONN DIST.—Deer Lodge *Independent*, May 25: Vipond Bros. worked 5 hands all winter on the Miwanotoc shaft, which is down 150 ft. The Forest ahaft ia down 60 ft.; the Grey Jockey, 50 ft.; the Mammoth has heen suuk 25 ft. deeper this winter and shows 5 ft. of high grade ore all the way from the surface. Thia ore works $200 per ton. Next comes the famous Quartz Mountain, ahout 2 milea east of the Mammoth, where some 20 lodes have heen recorded. The Grey Eagle ia down 30 ft., and shows first class ore. The same Co. are sinking on the Humholdt and have a 5-ft. crevice of first class ore. The Aurora is down 50 ft., aud shows a well defined lode of high grade ore.

Dewey and Co. have been at work all winter on the Banner lode.

THE news from Ophir Gulch, Carpenter's Bar, and Pioner City is very encouragiug.

CLEAN-UP.—W. Stephens of Pioneer, informs us that Tom. Stuart and the Thomas Bros. cleaned up over $5,000 last week, the proceeds of 3 pipes for one week in Bratton's Bar.

BUTTE.—Mr. Humphreys reports every man

in that camp as working, and that there is a large quantity of water running to waste for want of men to use it.

PILGRIM BAR.—There are 10 Cos. mining on Pilgrim Bar and all who have their mines opened properly are doing well. The Rock Creek Ditch Co. are selling 1,800 inches of water daily and the Little Rock Creek Ditch furnishes 600 inches daily. Holcomb & Berry, for the week ending May 18th, cleaned up $4,-100.

BEARTOWN.—There is not an idle man in that camp. In the dry diggings the mines are paying well. The deep diggings are obstructed by high water. Clegg & McDonald, on Phelan gulch, are running two pipes.

SNOW SHOE GULCH.—Mining is being carried on from the valley to the summit of the mountain, a distance of 8 miles. Five Chinese Cos. are working on the lower part of the gulch. Rufus Johnson is running a crew of men on his big flume in main gulch, has a string of sluices going on the lower hill and is putting down a flume through which to work the upper hill. Moore, Trewhella, Otta & Co. are working half a mile above the mouth of the cañon. Kelly & Co., above, are running their hydraulic and will commence cleaning up bedrock in a few days.

FRENCH GULCH.—The Swamp Co. are running day and night. The claim pays about $20 per day to the hand. The Lucky Gulch Co. work six men, and take out about $40 per day. Lamay & Co. on First Chance, are taking out from $15 to $20 per day to the man. Orhini & Co., on the same gulch, make from $6 to $7 per day to the hand. Eccleston & Co., also on First Chance, have just opened their grounds. W. N. Allen, on Allen's Bar, is running two pipes with good results. Lynch, Dingle & Co., on Fenian gulch, will work 8 men this season. Their ground is good for $25 per day to the man; 3 or 4 other Coe. are working, but as yet, with not very favorable results.

HENDERSON GULCH.—Hennessy, McDermott & Co.. have run a cut back into the Bar over 700 ft., and find better pay than ever before. Their claim pays from $25 to $30 per day to the hand. Cooney & Co., are making about the same. Cartwright & Co., are also doing well on the same Bar.

PHILLIPSBURG.—One of the roasters at the Stuart Mill is already completed, and the other will be in a short time. Col. Lyons is roasting 3 tons every 24 hours. The Stuart Mill is being furnished with dry-crushing batteries which will be completed in about 8 days.

YIELD AT DEER LODGE.—*New North West*, June 1: At Pilgrim Bar, Holcomb, Berry & Co., cleaned up for the last week's work $4,-5,000. H. Rodgers cleaned up 100 ounces.

BLACKFOOT.—About 600 men—300 white and 300 Chinese—are at work at Blackfoot, Carpenter's Bar, and Snow Shoe. The ditchee are full, water plenty, and the mines working night and day. More men are wanted.

Utah.

BUTTERFIELD CANON.—S. L. *Tribune*, June 6: We hear of new discoveries in thie cañon almost every day. The Garland, a new location, has produced from the surface some very fine chloride ore assaying 93 ounces of silver to the ton.

TINTIC.—Crimson in his tunnel on the Mammoth lode, has struck a large body of copper ore of the richest quality; half of it is reported to be native copper. A large body of rich galena ore is said to have been found in the famous Copperopolis. Meader's Swansea still pans out, exceeding all expectations. The Chicago and other leads near Silver City are being worked. Mines around Diamond City are doing well.

THE Sultan works in American Fork, are turning out 8 tons of bullion per day.

MOUNT NEBO DIST.—The Olive Branch, which is down 100 ft., shows a very fine body of ore. John Hague is taking out from 9 to 10 tone of ore from one of the Co's., mines daily.

COAL.—W. D. Wilson, called at this office yesterday and left samples of eome of the finest coal we have yet seen in the Territory. The mine, recently opened, is on Chalk creek, and the workmen have already struck one vein of 6 ft. in thickness, with every prospect of having an immense deposit.

MORE DISCOVERIES SOUTH.—The Wah Wah dist. is about 75 miles due west of the town of Bover, Bever Co.

The mines discovered are in a quartzite belt and the ledgee are well defincd, of large eize, many of them having been traced for a mile in length. The rock assays from $15 to $396 per ton. and is free milling ore.

THE Rocky mine, in Rocky Dist., has boen sunk on 17 ft., having followed the ore down on the ledge, which appears 50 ft. wide.

THE Lawrence is about 20 ft. wide.

A NUMBER of ledges belonging to Hammond, Gray & Harkness, includiug the Champion and other good locations, are beiug worked vigorously.

THE Chamelon ie sunk 20 ft.; shows one of the fiuest bodies of mineral that has been seen in the country at that depth. The New Englaud, is about 6 ft. wide on the surface.

IN North Star, the Old Hickory mine showe 6 ft. of mineral at 70 ft. From tbis point the Co. ie running a level. There are over 100 tons of ore on the dumps.

THE Shenandoah and Mitus continue to proepect well.

WEST Camp, whicb lies over the divide west from North Star, has the temperance mine, the Lookout, and Lady of the Lake, all of which show remarkably well.

Corals and Coral Islands.

"Corals and Coral Islands" ie the title of a beautifully bound book of some 400 pages, by James D. Dana, Professor of Mineralogy and Geology in Yale College, and anthor of varions scieutific works, roports, etc. This work is profusely and most beautifully illustrated; and while the subject is one of much interest and importauce we havo an anthor fully competent to present it.

Prof. Dana is a man thoroughly versed in thie and kindred subjects, a close observer and a writer of high literary taste. Tho facts which he presents were obtained by persoual observations made as geologist, duriug the four years exploring expedition of Commodore Wilkce. Since making his official report he has further studied the subject of corals and coral polypi, collected other facts from later observers and brought a maturer judgment to bear upou the subject, whereby he has been euabled to throw much additioual light upon the habits of these singular organisms, the important past they have acted in the economy of nature, aud the wouderful assistance their remains have become to the geologist in his researches into changes which have taken place in the earth'e crust duriug the immeuse geological periods iu whicb they have lived aud multiplied.

This work may be cousidered as a special coutribution to *popular science*—to the diesemination of accurate and popular scientific information among the people. The Profeseor has therein, without any eacrifice of scientific precision, fairly entered the field as a missiouary of ecience in the world work of converting the people to a proper appreciation of the great truthe which God has written in the books of nature, and which sbould he as universally etudied and understood as His otber Book which has been handed down to ne as hie *revelation* to man. The author very properly observes in hie opening chapter that "a singular degree of obecurity has possessed the popular mind with regard to the growth of corals and coral reefs, in consequence of the readiness with which specnlations have been supplied and accepted in place of facts." It appears to be one of the objects of the present publication to disabuse the public miud of euch errors, and to give, in a manner readily comprehensible by all, and made still more clear by numerous illnstrations, a correct statement of all the facts connected with the subject.

The chapters on the structure of coral reefs and islands; their formation and the causes of their features; ohanges of level in the Pacific Ocean; geological conclusions, etc., are all valuable contributions to scieuce, and especially worthy the attention of the general reader.

So interesting is the character and habits of the coral polypi, that we propose to give a short resume thereof from the pages before us as soon as we can prepare the engravings necessary to illustrate the snbject. In the meantime we would refer our readers to the book itself which may be obtained of A. Roman & Co., the San Francisco publishers. Aside from its intrinsic merits, the book will be found an elegant ornament for the center table, and a most acceptable testimony of regard which one friend may wish to manifest for auother, in the way of a present.

CROPS IN SAN JOAQUIN—WHEAT NEARLY RIPE.—J. A. McCloud brought to this office yesterday a sample of his wheat orop on the south bank of the Tuolumne river, about three miles and a half from Modesto. Mr. McClond and R. Whitmore own jointly 2,360 acres, and they expect to harvest no less than fifty thousand bushels. They will commence harvesting in the course of about ten days. The sample brought here yesterday is nearly ripe, finely headed, and the grain plump and full. The stalks are over fifty-four inches in hight, and the whole is ripening equally. Mr. McCloud tells us that he has never seen any wheat field to surpass this in appearauce. The advantages of the late favorable weather to the wheat crop generally are almost beyond calculation. As harvest approaches the prosects brighten, and the farmers everywhere are full of spirit.

Republican, June 8: George W. Sperry brought to this office last evening samples of wheat, the product of his land on the west side of the San Joaquin river, abont four miles south from San Joaquin City. In that locality he has five hnndred and sixty acres in wheat and one hundred and sixty acres in barley. Mr. Sperry and brother, who own the land jointly, commenced sowing in the middle of February and completed the work on the 15th of March. The sample of the last sown, which he brought to this office, is a little over thirty inches in hight and finely headed.—*Independent.*

S. F. Stock and Exchange Board.

THURSDAY, June 13.

The sales at the Board for the week euding on the 5th inst. amounted to $2,014,000, an unusually small figure as compared with the weekly sales for the past few months. The shipments made from tho Raymond and Ely mine on the June account, amount to $129,600. Over 1,000 tons of ore were milled at the Eureka Consolidated mine last week. Tho Sierra Nevada mine yielded 400 tons of ore last week, and shipped $4,400 on the 8th, inst. The Hale and Norcross mine yielded 230 tons, leaving 1,370 tons on the dump. The Chollar Potosi yielded 1,100 tous during the same period; and the Savage 1,130 tons, assaying $31.90 per ton. The last weekly clean up of the Eureka mine of Grass Valley was 625 ounces of amalgam. The Pioche mine sent down $15,000 ou the 6th inst. and $12,341 on tho 12th. The yield of the Crown Point mine during the past week was 1,700 tons of ore, valued at $68,300. Water still retards the work.

Stocks have beeu both up aud down during the week to a eomewbat remarkablo degree. On Thursday, the 6th inst., in the afternoon the market was quite weak, and ou the Friday following, prices were etill lower. Saturday stocks were again quiet, witb very light ealee and weak prices. On Monday the market began irregular hnt firmer. Tuesday, stocks were up agaiu and a much firmer feeliug existed, ae nearly all descriptions ehowed a emall advance. Wedneeday, the upward tendency was checked and most kinds were a little lower. To-day the business wae very light and prices were weak, showing a general decline. The mining news from all over the coast is favorable.

THE SCIENTIFIC PRESS is one of our very best exchanges. Not only in its reports of mining news, but also in first-class reading matter, useful and interesting, in scientific information, and in ite home department does it excel. We are glad to know that the PRESS has a good list of subscribers in these parts. It is deserving of more of both.—*Colorado Miner.*

MINING ACCIDENTS.—H. L. Newton, foreman of the Robiuson mine, Prospect Flat, near Placerville, was instantly killed last week, by heing run over by a loaded car.

Francis Richarde, working in the lower level of the Idaho mine, wae eerionely hurt on the 6th inst., by a piece of rock which fell from above, breaking his leg, and otherwiee injuring him.

Wm. Fitzgerald, was instantly killed in the Adams & Farren shaft of the Phœnix mine on the 5th inst. He fell 100 ft., while attempting to get in the cage to aecend.

Peter Leonard was eeverly hurt by the premature explosion of a blast in the Hale & Norcrose mine on the 6th inst.

Peter Ohlsen, working at the Ophir hoisting works, had his band mangled last week, while oiling the machinery.

John McCabe, employed at the old Logg's Mill, Nevada City, came near being crushed to death recently, while putting on a new shoe in the battery, by the 1,000-pound stem falling on a crowbar which he held, and which gave him a pretty tight squeeze against the side of the battery.

[Written for the PRESS by G. KUSTEL.]

Vienna World's Fair.

To be opened May 1, and closed October 31, 1873.

Before refsrring to the programme of this fair, published already in many papers, it might be interssting to Californiens to heer a few words abont Vienna and otber parts of the Empire, with reference to visitors. It seems to bs an ebsurdity to make a comparison between Visnne and Californie; but, there is neverthelsss, at least, a similarity of social circumstances between this young State and that old empire city; a kind of relationsbip, inviting particnlarly California sn masse, and their—pursss. California attracted edvsnturers of all parts of ths world, and after many years of hard labor of purification, we see now that progressive indnstry, commerce and science ars beginning to take the lead in all pursuits.

This singular social development of a strangely mixsd community, imprsssed on California a noted cosmopolitan, polyglotic character, more so than any othsr State of ths Republic; and so is Visnna the most cosmopolitan city in Europe, owing this character, like California to the mixed socisty of natives and foreigners, by whom it was built np. Strangsrs visiting Vienna, feel at home in the shortest time. The wsll-known heartiness and hospitality of the Visnna psopls, the magnificent surroundings, the brilliant thsatre, exqnisite music, everything contributes to make foreigners comfortable and at homs, much more so than Paris, London or any othsr Enropean city. Rsfinsd Californians, who consider it insufficisnt to cultivate ons's mind only, knowing that thsre is also a physical part to be taken care of, will discover the snperiority of the Vienna tables, and Hungarian wines. Who delights in arts and sciencee, will find an inexhanetible supply to satisfy his desire, not to forget the immense imperial collection of mineral, logical and geological specimens. The Austro-Hnngarien Empire is exceedingly rich in various raw products, for it is eminently an agricultural State, and an extensive market for imports and exports. Being once in Vienna, it is worth while to make a trip to Hungary by rail or steamboat. The farmer will find there interesting instances of rural indnstry; wine, tobacco of excellent quality, flax, hamp, silkworms, sngar beets, etc.

Hungary, is, however, of much more interest to a Californian who has a taste for mining. In three daye he can reach the centre of mining in Banat, (eontheastern part of Hnngary). Iron, copper, lead and eilver ores, are treated here in varioue ways. The principal mining town is Oravitza. The next very extensive mining field of gold, silver and other ores is Transylvauia. Those who are fond of natnre and magnificent scenery, will not travel from the Banat mining district direct to Transylvania, but will make a sligth detour to Basias, and from here by steamer on the Danube to Orsowa. The river flows here with majestic quiet, winding slowly between exceedingly high perpendicular rocks, on the right hand side Servia, on the left Hungary. On the latter side is a splendid view of a modern wagon-road blasted ont in the perpendicular wall leading to Oreowa, in some parts beautifully ornamented with most luxuriant vegetation. On the other side is an old Roman trail, extending for some distance, partially destroyed by the ravages of time.

Ariving at Oreowa, the stranger is struck by the singular appearance of that friendly situated place. Wallachian women neatly dressed in peculiar style, may be seen walking carelessly along the street, on their heads a little wooden trongh with a sleeping baby in it, and they may sometimes be seen spinning their flax while walking. In the same way water-pitchere are carried on the head with ease and safety, as is done in Egypt or Mexico. Here you see Turks, Servians, Wallachians, Hungarians, Germans, Gypsies, etc. Here is also the point from where one can see four different territories; yon see Hungary, Servia, Wallachia and Turkey. The last being represented by a fort, "Orsowa," in the middle of the Danube, worth being visited by all strangers who come to Orsowa. A splendid road with cherry, plum and mulberry trees on both sides, leads yon to Caransebes, and from here, instead of going the regular route to Transylvania by way of Lugosh, you go north through the "Iron Gate" if you have a desire to see Roman antiquities. For instance, at Demsush an old Roman oracle temple with a kind of an altar, with the secret snail stairs in it, leading up to the speaking tube—through which the priests sent down their mysterious answers in an awful inhuman voice—all well preserved yet. Beyond the iron gate at Gredistye, (a Wallachian village) a floor has been discovered four feet below the ground, beautifully laid out with mosaic of different but natural colors, representing in life size, Paris with the golden apple before Venus, Minerva and Juno. In the same place one can see the ruins of an amphitheater of the once flourishing city of Ulpia Trajana. Further in the Hatzeg Valley is an old Roman, macadamized, tolerably well preserved road several miles long. It takes one day's travel from the iron gate through the Hatzeg Valley to Deva, wherefrom you get sight of the first Transylvanian gold mining town, Nagyak, where telluride of gold and of silver, etc., is the principle ore.

From this place, a great many gold and silver mining places of much interest may be visited, where primitive and modern means are employed to sxtrect tbs gold. A Californian will find thers a great field for improvements, especially at Veres-patak, Abrud-banya, etc., bnt he will ses, also, many other things there worthy of notice. Heving done with the principal mining places of Transylvanie, one cen turn to the northwest part of Hungary, which is also a very extensive mining region. The principal mining town is Schemnitz, with ths celebreted Royal Mining Academy, and deep mining. Tbe concentration of ores is here executed efter Rittinger's principle to a high perfection. It is neither in Hnngary nor in Anstria the custom to extol their mining improvements, nevetheless a grsat many metallurgical (and especielly concentrating) improvements and inventions which are ussd in other countries, originated there.

Ore Specimens at ths Fair.

The importance of having onr mines and mining interests represented at this World's Fair by a collection of ore specimens, etc., need not to be explained any further than to refer in this respect to the result of ths last Paris exhibition. The presentation of our mineral resources at ths Vienna fair may prove éven more bsneficial to our interest than tbe last one. Tbe gigantio preparations, started under judicious and thorongh scientific management, with the experisnce gained by observing the workings of the London and Paris exhibitions; with ths view of improving and snlarging ths field, not for the sake of multiplicity, or only, as was the principal aim of the formsr two great sxhibitions, to prodnce a zealous competition amongst men of industry and arts, but more for ths purposs of enabling the largest possible social circle to dsrive from a larger field a more extansive practical application of all branches of indnstry, art, science and human comfort. These preparations sesm to justify the expectation that ths Vienna fair will surpass the former two in its influence on the development and progress of industry and commerce of all nations, and attract more visitors from all parts of the world. The Municipal Court at Vienna, gratuitously ceded its valuable Prater ground, on which already an immense number of beautiful trees have been laid flat to make room for the giant palace. The industrial world favored this undertaking with such an enthnsiasm, that several millions have been snbscribed in a few days as a guarantee fund for exhibition purposes.

Programms of the Fair.

According to the programme, the following divisions were made for the exhibition: 1. Mining and Metallnrgy. 2. Agriculture, Arboriculture, and Horticulture. 3. Chemical Indnstry. 4. Aliment and Food. 5. Textiles and Clothing Industry. 6. Leather and Rubber Material. 7. Metals. 8. Wood. 9. Stone, Earth and Glass Ware. 10. Fancy Goode. 11. Paper Indnstry. 12. Graphic Arts and Drawings. 13. Machinery and Means of Transportation. 14. Scientific Iustrumente. 15. Musical Instruments. 16. Army. 17. Marine Matters. 18. Architectnral and Civil Engineering Appliances. 19. Civil or Middle-Class Dwelling Houses, with internal arrangements. 20. Peasant's house, with its arrangement and ntensils. 21. The National House Indnstry. 22. Representation of the efficency of Museums for Art purposes. 23. Ecclesiastic Arts. 24. Objects of art of olden times, exhibited by collectors. 25. Painting and Sculpture of the present time. 26. Matters relating to Education and Instruction.

Special Exhibitions.

I. Represents the ntiliation of the waste or refnse obtained in most branches of industry.

II. Exhibition of contributions to the history of industry and inventions.

Five medals will be distributed: *a*, Medel of Arts, for painting and sculptnre; *b*, Medal of Progress, for those who contributed to former World's Fairs, and can prove a progress since; c, of Merit, for first-time exhibitors; *d*, a Medal of Good Taste, for exhibitors whose articles show a refined taste, with reference to color, shape, and general outfit; and finally, one for workmen, for such as recommended by the exbibitor for a prize-article as having performed the most important part of it.

The object of No. 19, is not merely to make a collection for showing how family houees nsually look under different zones, but how they should be arrauged in order to serve best the national requirements and customs, with reference to local and climatic circumstances. They must show: *a*, a division of space with the greatest economy of the ground surface, offering the most comfort; *b*, architectural arrangement and decorations, combined with taste, and serving the purpose; c, a proper arrangement of ventilation, illumination, heating, etc.; *d*, a kitchen, pantry, cellar, bathing-rooms, and other departments necessary for cleanliness and comfort. Individuals of all nations have thns an opportunity to compare their arrangement with those of other countriee, and perhaps profit by it.

The group, No. 20 presents peasant's dwelling-houses. Group 21 exhibits national honse indnstry. It concerns principally pottery, weaving, needle work, ornamental work in metal, wood, etc.

Utilization of Refuse.

A very interesting and useful subject in the special exhibition, appears to be "the ntilization of refuse stuff." The programme eays: The consumption of soap, paper, the extent of letter intercourse, the number of public libraries, etc., is often pointed out as an indicator of the intellectual condition of the people, aud just so its industrial developement, scientific and speculetive genius might be measured by the extent of profitable utilization of the "refuss stuff." The rsalization of before nsslsss waste into a useful article, auguments the common wealth, not only by consumption of refuse, but also of such stuff that often appsars to be very obnoxions.

So for instance was the massive refuse of soda works a great nuisance; now they extract therefrom sulphur, and the remaining lime and gypsum makes a valuable materiel for agriculture. The sour mangenese solution from ths fabricetion of chlorate of lime, that was turned out before, prodnces now also a valuable material. Coal and wood ter become a very nseful article now-a-deys, many important ingredients are manufactured therefrom; benzine, paresine, creosote, carbolic acid, the splendid aniline colors, etc. The glycsrine in stearic acid production and the ammonie from light gas, were wested nntil 1850. Woolen rags, before partly used to tbe manufacture of cyanide of potasium, or of a low quelity of peper, but generally valuslsss, are now liks silk and cotton refuse, raw material for textile industry, etc.

The ntlization of refuss, that is the opening of nsw indnstrial sonrces, by which now millions ars realized, while formerly millions were expended to get rid of it, shows the deep infinence of science on the popular life.

1. Objects that are considered "refuse" will form the initial articles of this department. 2. With rsfersnce to the time, embracing this part, it corresponds with that fixed for other groups, that is ths year 1851 as the beginning. 3. In accordancs with the system adopted for the classification of the general exhibition, to this ons special articles are admitted. Refnss, occuring in each group of industry, and on the other hand, the products therefrom obtained either entirely new, better or cheaper, upwards from ths year 1851. The single number of this department comprises all intermediate articles or msmbers, from the refuss to the finshsd marketable article.

So far as possible the exhibition is effected by objects *in natura*, but where this should appear inadmisable, a graphic representation may be given in its place. The objects should be accompanied by a description of process, statistical representation of the production, the name of the discoverer or improver and all dates refering to history of the production. The exhibition of

II.—Contributions to the History of Industry and Invenlion

Is likewise of great interest. The special programme says: Amongst various characteristic appearances of the 19th century stands prominent the developmeut of indnstry and in the closest connection therewith the inventione following each other withont interruption. Owing to the animated intercourse between science and life, more so, than in any other period, a progress and change of unsnrpassed grandeur and wide-spreading influence is observed in the production generally, but especially in the exclusive industrial line. What surprising transformation has been effected from professional hand trades, into fabrics and manufactoriee with immense economical, political and social consequences, grand structures, breaking throngh and croesing of high mountains, nniting oceans, changing deeerts into flourishing eettlements, and a great many modern wonders, all achieved in the short time of a few decennariee, works that would have required centuries in olden times.

Theee brilliant results were achieved by the aid of many gifted men; but their names, not all are known to us, many are alienated from us, even if the time of their action is not far off yet. One might eay, witnessea of daily progress, we have lost the faculty of maintaining the claims of individuals who have a share in the great development.

It seems, therefore, that it should be considered the aim of a World's Fair to take cognizance not only of what is offered by the present bnt also of the past time, so as to revive the memory of men, to whose energy and skill we owe onr prodncing faculty. Being in itself the identity of common interests of all nations, a World's Fair should take np everything that may foster the personality of mankind, and what field in this respect is more qualified than that of inventions and industrial products? This concideration originated the idea of this additional exhibition. There are, however, some other considerations yet in favor of this addition. Fashion and industry are closely connected with each other. Indnstry has a great influence on the fashion and leads it in certain directions, but on the other hand a great many manufactured articles have to assnme to a great extent a character as dictated by the fashion.

Industry and inventions appear so intimately connected as to be considered inseparable. Indeed, now-a-days, it seems almost impossible to draw up a history of industry without taking notice of the respective inventions. As to the spaoe of time within which this exhibition extends, the time of the inventiou of the steam engine is calculated for the beginning; consequently for thie department a century is adopted. *a*, by machinery, tools, or preparation *in natura*; inmodels or drawings; and description of the manipulation, by which the gradual improvement of means, or of the way of working, is explained; *b*, by industrial productions, showing a prominent influence exerted on the fashion, or snstained by it; c, by a written information as to what individuals have accomplished by introducing a better economy, by adoption of a more proper working system, etc.; *d*, by exhibiting raw and crnde stuff *in nature*; such as have been introduced into the arena of industry dnring the lest century. The objects of each number should bs accompanied by a description, giving the name and biography of him who meds himself prominent in one of ths above four directions. This additional sxhibition offers a rare chence to

California

To show to the world, whet an intslligsnt, enterprising, go ahead people can accomplish on tbe field of industrial progress and in mining and metellurgy during, not a century, but in course of twenty yeers; or rsferring exclusively to metallurgy, in twelve years. A rspresentation of our development in the above brancbes would fall into the department under *a*, and should be represented by models of a size sufficient to show it psrfect in all details, although some parts may bs given in a largsr or natural sizs. Tbis exhibition should consist of four gronps. 1st. Extraction of gold in plecer mining. 2d. Crushing of ores. 3d. Extraction of gold from orss. 4tb. Extraction of silver from ores.

The Extraction of Gold in Placer Mining

Should represent the tools and machinss, used in the infancy of our mining, beginning with ths gold pan and cradle, showing thsn the gradnal development by means of the long tom, with its progressive improvements, sluicing, use of qnicksilver, riffles, ground river sluicing and so forth np to hydraulic opeiations. It would be very instrnctivs to add samples of gravel, black sand, cement and other material from which gold is extracted by washing; samples of different kinds of wash gold would be doubtless also be accepted with pleasure. All could bs arranged in a natural position repressnting also the ground from which ths stuff is ussd. A written comprehensive description of the way of working, including a short history, naming the inventors or improvers of importances, should be added.

The extraction of silver and gold can not be execnted nnless pulverized, for this reason the next number should be

Crushing of Ore.

In 1851 our principal means of crushing consisted in arastras, in the primitive Mexican style, consnming one week's time to pulverize one or two tons of quartz. Limited ae this institution is in its grinding faculty, it wae nevertheless considerably improved, not only in saving time while cleaning np by introducing iron bottoms that were lined with stone, bnt also its grinding capacity increased by enlarging the size, proper management of the grinders, increased speed, etc. The rapid discovery of gold qnartz ledges called quite a legion of all sorts of grinding and crushing contrivances into the field. The English rollers, and clumsy stampe after the English and German style, were the principal means of reduction. After a short strnggle all these numerous apparatue had to give way to stamps, as the most suitable and most effective cruehing contrivance A gradual but wonderful improvement was effected in this line, and now-a-days the California stamp batteriee are superior to all others. Represented by models in all its phases of development from the beginning to the present time, this exhibition would be admired by tbe whole mining world. Take only the original tappet and its troublesome way of fastening, and the stem preparcd for this purpose, the fastening of the dies, the construction and arrangement of cams, frame, foundation, etc., and compare it with batteries of the present time, the expression "wonderful" will be quite proper.

Extraction of Gold from Ores.

This part, although somewhat limited, in accordance with the uniform appearance of gold, confined principally to two conditions, either free, or combined with sulphnret of iron, will furnish a eeries of interesting improvements nevertheless. The different application of copper plates in and outeide the battery, amalgamating contrivances, blanket sluicee and the different means of treating the blanket stuff with all the improvements connected with the amalgamation, the improved contrivancee for chloridizing gold eulphurets permits a very instructive display of models.

Extraction of Silver from Silver Ores.

The beginning of this branch of mining indnstry on the Pacific coast, dates to the year 1861, based on amalgamation. The mode of extraction soon split in two directions, that is, with and without roasting; and in both ways a rapid progress crowned the unwearied exertions of talented men. The European barrel and the American heap amalgamation (Patio,) nearly disappeared, and gave way to the "home inetitution" pan amalgamation. The pan amalgamation was started with charges of 50 pounds, now we have charges from one to three tons, and exceptionally treating tailings, even eight tons make a single charge. But before this result was obtained, hnndreds of different plans combined with heavy expenses were carried out; numberless obstacles overpowered by preseverence and continual labor. The improvements and chenges in pan amalgamation have a mechanical and metallurgical character, and are very numeroue, The different kinds of pans of special merit with temporary changes, the mode of amalgamation, cleaning and amalgam, retorting, the mode of roasting with the principal furnaces should be presented by models and description, bnt a epecial interest would be to conclnde the exhibition a this part by a model of a complete mill, with all modern improvements.

To carry out this proposition, nothing ie in the way bnt want of funds. Where is a California Peabody?

Useful Information.

To Shave Scientifically.

Never fail to wash your beard with soap and water and to rub it dry, immediately before you apply the lather, of which the more you use, and the thicker it is, the easier you will shave.

Never use warm water, which makes a tender face. In cold weather, when it is inconvenient to warm your razor otherwise, place it, closed, in your pocket or under your arm to warm it. The moment you leave your bed (or bath) is the best time to shave.

Always wipe your razor clean, and strap it before putting it away; and always put your shaving brush away with the lather on it.

The razor (being only a very fine saw) should be moved in a sloping or sawing direction, and held nearly flat to your face, care being taken to draw the skin as tight as possible with the left hand, so as to present an even surface, and to throw out the beard.

The practice of pressing on the edge of a razor in stropping it soon rounds it; the pressure should be directed to the back, which should never be raised from the strop. If you shave from heel to point of the razor, strop it from point to heel; but if you begin with the point in shaving, then strop it from heel to point.

If you only once put away your razor without stropping it, or otherwise perfectly cleaning the edge, you must no longer expect to shave well and easy, the soap and damp so soon rust the fine teeth and edge.

A piece of soft plate leather should always be kept with razors, to wipe them with.

A Supposed Freak of Nature.—A Vicksburg paper furnishes the following as a freak of nature. The item is having a very general circulation through the newspapers:—Upon a spot where had been buried a soldier who fell at Champion Hill, who was buried in his blood, grew a peach tree that had reached maturity, while its roots steeped themselves in the martyr's blood. Singular to relate, the leaves and fruit of this tree are a blood-red color. The tree was transplanted, and is now in an orchard in this country. The propagations from the tree are of the same peculiar color. There is something very peculiar about this. We have seen the leaves, and must confess that they do look and even (to us) smell like blood. The fact can be witnessed by those taking the trouble."

There is a variety of the peach which very fully answers the above description, and it don't always grow on a soldier's or any other grave; although such a locality, especially if it was a mellow one, would most probably greatly improve the appearance of both tree and fruit, and especially its peculiarly distinctive character of redness.

What a Piano is Made of.—A writer has taken the trouble to give the actual material used in constructing a piano-forte. In every instrument there are fifteen kinds of wood, namely, pine, maple, spruce, cherry, walnut, whitewood, apple, basswood, and birch, all of which are indigenous, and mahogany, ebony, holly, cedar, ebeeb, and rosewood, from Honduras, Ceylon, England, South-America, and Germany. In this combination elasticity, strength, pliability, toughness, resonance, lightness, durability, and beauty are individual qualities, and the general result is voice.

There are also used of the metals, iron, steel, brass, white-metal, gun-metal, and lead. There are in the same instrument of seven and a half octaves, when completed, two hundred and fourteen strings, making a total length of seven hundred and eighty-seven feet of steel wire, and five hundred feet of white (covered) wire. The total number of strings, when properly stretched to produce the right tone, exert a pull of over ten tons; this represents the force with which one end of the piano is drawn towards the other end, and it explains the reason why good pianos are built so strong and so heavy. Such a piano will weigh from nine hundred to one thousand pounds, and will last, with constant use, (not abuse) twenty to twenty-five years.

For Re-Sharpening Files.—The following is given by an exchange as useful and effective; but we have not tried it:—Wash the files in a solution of warm water and potash until thoroughly cleansed, after which wash the files in warm water; then put one pint of warm water in a wooden dish, in which place as many files as the water will cover; add to this two ounces of borax and two of blue vitrol, finely pulverized together. Stir up the files well and add two ounces of sulphuric acid by weight; to this add one-quarter ounce of vinegar. The files will turn red. When they again resume their natural color, take them out and wash them in cold water, after which they must be thoroughly oiled with sweet oil, and wrapped singly in brown wrapping paper which will absorb the oil from the files.

A French economist says, in his opinion Egypt alone can hide away $20,000,000 of gold and silver annually, and the present Emperor of Morocco is so addicted to this avaricious mania that he has filled seventeen large chambers with the precious metal.

Prize Offer.—The Agricultural Society of France offers a prize of 2,000 francs and a medal for the best memoir "On the Theory and Practice of Irrigation." The papers are to be sent to the Secretary before the ending of this year.

How to Sharpen a Screw-Driver.

The screw-driver is found not only in the tool-chest of every mechanic, but in most houses, and offices. It ranks with the hammer, the saw, and the ax in general utility, and yet few persons know anything about how it should be sharpened so as to do its work most efficiently—that is, with the least expenditure of power, and the least injury to the heads of the screws.

In driving a screw into wood, the force used to press the screw-driver against the head of the screw, tends to aid the latter in penetrating the wood, but when we attempt to extract a screw, every pound of pressure that we apply tends to render it more difficult to get the screw out. It therefore becomes very important that the screw driver should be so formed that it may

Fig. 1. *Fig.* 2. *Fig.* 3.

be kept in the nick of the screw by the exertion of the very least degree of force, for if it has any tendency to slip out, we can keep it in place only by applying pressure, in which case we run great risk of injuring the nick and rendering it impossible to draw the screw.

If we examine a screw-driver in the condition in which it is so ordinarily found, we shall find that it presents a section like that shown in fig. 1, in which the sides of the wedge, in which all screw-drivers terminate, are curves with the convex sides outwards. Now, the effect of thus curving the sides of this wedge, is to render it greatly more obtuse. Moreover, when we turn the screw-driver, the tendency to slip out of the nick is just in proportion to the obtuseness or bluntness of the wedge, and therefore this form is the very worst that can be chosen. In the hands of good workmen, therefore, we find that the screw-driver ends in a wedge of which the sides are perfectly straight, like fig. 2. This is a very good form, but is not equal to fig. 3, in which the sides of the wedge are curves, but the *concave* sides turned outwards. In this way we lessen the obtuseness of the wedge at the extreme point and produce a turn-screw which may be kept in the nick by the least possible pressure endwise.

To grind a screw-driver into this form, it is necessary to use a very small grindstone, and many of the artificial stones found in market answer admirably. Many mechanics would find it to their advantage to keep one of these small grindstones for the purpose, as it could be run in the lathe with very little trouble.

Something About Tongues.—Nothing but the proboscis of an elephant compares in muscular flexibility with the tongue. It varies in length and size in reptiles, birds, and mammalia, according to the peculiar organic circumstance of each. A giraffe's tongue has the functions of a finger. It is hooked over a high branch, its strength being equal to breaking off large strong branches or trees, from which the tender leaves are then stripped. An ant-bears tongue is long and round, like a whip-lash. The animal tears open dry, clay walls of ant-hills, thrusts in his tongue, which sweeps round the apartments, and by its adhesive saliva brings out a yard of ants at a swoop. The mechanism by which it is protruded so far is both complicated and beautiful. A dog's tongue in lapping water takes a form by a mere act of volition that cannot be imitated by any ingenious mechanism. The human tongue in the articulation of language surpasses in variety of motions the wildest emotions of a poet. Even in swallowing food its office is so extraordinary that physiologists cannot explain the phenomena of deglutition without employing the aid of several sciences.—*Hall's Journal of Health.*

Brain Work.—Brain-work costs more food than hand-work. According to careful estimates and analysis of the excretions, three hours of hard study wear out the body more than a whole day of severe physical labor. Another evidence of the cost of brain-work is obtained from the fact that though the brain is only one-fortieth the weight of the body it receives about one-fifth of all the blood sent by the heart into the system. Brain-workers therefore require a more liberal supply of food, and richer food, than manual laborers.

Old Leather.—What becomes of all the old leather? The scraps and trimmings that fall from the shoemakers' bench are collected and sold for the purpose of being converted into "leather board" to give thickness, but not value, to the sole of cheap shoes. The uppers of old boots and shoes that are not too badly worn, are removed from the demoralized soles and made to do duty as shoes with new soles. Thousands of such uppers are sold in the various shoe marts of the country.

Potash from Corn Cobs.—Dr. Herbert Hazard suggests the use of corn cobs for supplying potash, the ordinary sources of which are rapidly failing. The average yield of corn cobs is 7.62 parts of carbonate of potash in 1,000 parts of the cobs, which is nearly twice as much as the best kinds of wood will furnish. The present supply of cobs would furnish nearly 58,000 tons of potash.

Good Health.

Nature of the Brain.

It is a law of organic life, traceable from the lowest specimens of the animal kingdom, through all the ascending series, to the highest type of the human being, that, in the ascending scale, the softer and more fluid tissues gain on the more dense and solid; and that the cerebro-spinal nerve tissue gains upon all other tissues. Thus man, the crowning work of organic creation (for the present at least) has a brain substance vastly disproportionate to that of any animal, and the brain is composed of only one part of solid matter to seven or eight of fluid.

A recognition of this law leads us to some very important practical considerations. The capability of any animal or person to enjoy or suffer is in the ratio of the cerebral development. Hence a large animal with powerful muscles may struggle violently yet suffer little pain; while a human being with weak muscles and large "vitativeness," may suffer excruciating pain without manifesting much muscular effort.

If this principle were understood, those praiseworthy "Societies for the Prevention of Cruelty to Animals," might establish a branch or department for the benefit of human beings; for there is in every large city in the world, more cruelty practiced on human beings every day in the year, than on all the animals in all creation during a whole year.

Another lesson deducible from these premises is the mistaken notion about overworked brains. They cannot be overworked. They suffer little "wear and tear," because of exercise. Being soft and almost fluid, and having no duties but thinking and feeling, their motions are almost as free and frictionless as the drops of water which may toss and tumble for ever without injury.

It is the nutritive system that is at fault—the assimilating and disintegrating functions—and not the brain, when a person complains of too much head work. Let him keep his vital machinery in order, and he may work his brain to the utmost without harming it.—*Science of Health.*

Sound Teeth.—Mushes, gruels, puddings, and soups, may be made hygienically. But they should also be eaten hygienically. They must be chewed, not bolted. The nursing infant masticates its mother's milk, for which purpose it takes it slowly, drop by drop. Mastication is for the purpose of insalivation. Unless food is properly insalivated, it cannot be well digested. The teeth are the finest, densest structure of the body, and this means that they are intended for hard work.

Eat solid food at every meal; and when you take semi-liquid, or very soft food of any kind, eat very slowly and take a bit of hard bread, cracker, a green apple, or something similar, with it. Then will your stomach please and be pleased, and your teeth, like your eyes and nose, and fingers and toes, will remain to bless and comfort you to the last. If all persons, after being weaned, would only chew their food enough, we should hear very little of aching and rotting teeth, and dentists would be nowhere.—*Science of Health.*

Sprains and Bruises.—These injuries are sometimes very distressing and their consequences very serious. The dense ligaments and membrance of the joints swell, and sometimes inflame, as the result of local injuries, and the pain is often extreme. But, simple water is about all the treatment needed. It should, however, be of a temperature adapted to the circumstances, the indication being to unload the congested vessels of the injured part as much as possible. If the part is hot and painful apply cold water or cold wet cloths, frequently renewed, until the heat becomes normal. If there is pain or tenderness without increased heat, apply fomentations until the pain is relieved. All the after dosing required in either case is a wet cloth covered with a dry one, and worn until all tenderness is gone. This simple treatment will do all that any medication can do, and is better than all the liniments and lotions, plasters and poultices, that were ever invented.

What is Insanity?—At a murder trial in Memphis, Ky., wherein an attempt to establish insanity was made on the part of the defence, Dr. J. R. Allen was called as an expert, and testified as follows: "I have been a practicing physician for nearly thirty years; I have had some experience in cases of insanity, having been for ten years medical superintendent of the Kentucky Lunatic Asylum, and during that time had over 2,000 crazy people under my charge; I have heard the hypothetical case read by Mr. Phelan; I am here as an expert, and before answering the question would like to say that the more I studied the qestion of insanity the less I understood it, and if you ask me where it begins and where it ends, neither I nor any physician in the world could tell you; in fact, on occasions like this, lawyers make fools of themselves in trying to make asses of doctors."

Absorption by Bones.—M. C. Robin states that matters injected into the spongy tissue of bones in the living subject are absorbed as rapidly as if they were introduced directly into the veins, from which he inferred that this spongy tissue is in direct connection with the veins.

Plant Life in Town.

The health of towns has become a hackneyed subject, but we seldom hear about the health of plants in towns. Yet the two are not only nearly correlated, but well-nigh identical. Were plants healthy, the inhabitants would probably be likewise, and the obverse is true. Towns in or near to which plants refuse to thrive are also those most fatal to man. The primary foundations of health in both are heat, light, food, cleanliness, pure air and suitable weather. With the single exception of heat, which, in the open air, may be assumed to be nearly equal in town and country, it must be admitted that large towns imperil the purity, lessen the quantity, and interrupt the constancy of most if not all the other essentials of health. In many large towns the light of the sun is obscured for more than one-half its shining hours. Therefore, who can wonder at the pale faces which one finds among men, women and children, and the shabby aspect of plants in towns? Heat is the great quickner, light the chief strengthener of plants. The reason so many die in dwelling-houses is that they have so little light. They linger, pine, and refuse to grow in many towns for the same reason. The pestilence that kills plants by thousands is bred of that semi-darkness which hangs as a death-pall over so many of our smoke-capped cities. When that darkness flies before the rigid enforcement of a smoke-prevention act applied to every fire, then will plants in towns rejoice, be clothed with new strength and adorned with fresh beauty.—*The Garden.*

Lead Poisoning.—Since attention has been directed to the subject, cases of lead poisoning, traceable to the use of hair-preparations containing lead, are found to be very frequent. A case of this sort was recently reported in the medical journals, which was at first mistaken for muscular rheumatism, and treated as such with but slight amendment. Paralysis of the extensor muscles of the fingers and hands, with "wrist-drop" coming on, the true nature of the affection was seen, and its cause readily found in the frequent use of a hair-renewer containing a large proportion of sugar of lead. No lines were seen upon the gums, but attacks of colic had been frequent. Discontinuance of the hair-dressing, and a resort to the ordinary remedies, soon affected a cure.

Bath Treatment for the Small-Pox.—An instance of the effect of the bath treatment for small-pox is thus described by Dr. Stokes, of Dublin: In a very severe case of confluent small-pox in which the patient was kept alive only by stimulants, the trial of the warm bath was suggested. The effect was instantaneous and marvellous. The delirium ceased as if by magic. It was the delirium of pain; and the patient exclaimed: "Thank God! thank God! I am in heaven! I am in heaven! Why did'nt you do this before?" The fetor immediately and completely disappeared, so that, on entering the ward, no one could suppose that there was a case of small-pox in it. He was kept at least seven hours in the bath.

How to Make a New Nose.—The method usually practiced is as follows: A small place is opened upon the arm, between the elbow and shoulder. The arm is then brought up to the stump of the nose, which is inserted in the cavity previously made. The arm is next tied to the head, and allowed to remain in that position until the nose and arm grows together, which ordinarily occurs in less than a month. Another amputation then takes place, which leaves plenty of good flesh sticking to the nose, and this, when trimmed, is a nose as good—sometimes better in a point of symmetry and beauty—than the individual ever possessed before.

Stimulants and Narcotics.—A recent German treatise on stimulants and narcotics estimates that infusion of coffee leaves is used by two million persons, Paraguay tea by ten million persons, chicory, either pure or mixed with coffee, by forty million persons, cocoa, either as chocolate or in some other form, by fifty million persons, and coffee by one hundred million persons. Betel is chewed by one hundred million persons, hasheesh is chewed or smoked by three hundred million persons, and opium is used by four hundred million persons. Chinese tea is drank by five hundred million persons, and tobacco is smoked, chewed or snuffed by the greater part of the inhabitants of the world.

For Reptile Bites.—One tablespoonful of gunpowder; one tablespoonful of salt; the yellow of one egg. Heat them altogether, so as to form a plaster, and apply to the wound. A yellow water will issue, and when the plaster becomes soaked with the poison it will fall off. Renew the plaster until it will adhere to the wound, which is evident that the poison has all been drawn. The above is said to be a very effective antidote.

For Stings of Insects.—A good, convenient and very effectual remedy for the stings of wasps, bees, etc., is simply to hold any hollow key, over the place stung, press it hard into the flesh for a minute or so, and when taken off, the poison will be on the surface of the flesh and do no harm. A thimble with a tight top will do but not quite as well.

Infallible Remedies.—For corns, easy shoes; for bile, exercise; for rheumatism, new flannel and patience; for gout, toast and water; for the toothache, a dentist; for debt, industry; and for love, matrimony.

Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

Advertising Rates.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Subscriptions payable in advance—For one year, $4; six months, $2.50; three months, $1 25. Oluhs of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

English and Colonial subscriptions, post paid, per year, £1 3s.; 6 months, 12s. Advertisements, per line, first insertion, 1s.; subsequent insertions, each, 3d. Large advertisements at special rates.

Illustrations and Reports of Mining Enterprises Wanted.—Drawings or photographs of mining works that are of general interest to our readers are solicited for publication in this journal. Official reports of Companies, and description of mines of importance, or of special interest, are also desired. Sketches of any new method and discoveries will be very acceptable.

San Francisco:

Gold and Legal Tender Rates.

San Francisco, Wednesday, June 13, 1872.—Legal Tenders buying, 88⅝; selling, 89. Gold in New York to-day, 114.

EDITORIALS.—Narrow Gauge vs. Broad Gauge, 376. Mechanics' Institute; The Paul Process, 377.

ILLUSTRATIONS.—The Hydraulic Ram, 369. Knapp's Hod Carrier; Adjustable Gearing, 377.

CORRESPONDENCE.—The Manufacture of Tea, 370.

SCIENTIFIC PROGRESS.—A Waning Star; Measuring the Height of Stars, 371.

MECHANICAL PROGRES.—Granite Works of the Ancients; A Short Coal Supply; Artificial Leather; Improvement of the Steam Engine; A New Kind of Flint Glass; Cutting Marble, 371.

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 356-7.

USEFUL INFORMATION—To Shave Scientifically; A Supposed Freak of Nature; What A Piano is Made Of; For Re-Sharpening Files; How to Sharpen a Screw-Driver; Something About Tongues; Brain Work; Old Leather, 375.

GOOD HEALTH.—Nature of the Brain; Sound Teeth; Sprains and Bruises; What is Insanity; Absorption by Bones; Plant Life in Town; Lead Poisoning; Bath Treatment for the Small-Pox; How to Make A New Nose; Stimulents and Narcotics; For Reptile Bites, 375.

DOMESTIC ECONOMY.—Hints About House Cleaning; What Food is Most Wholsome; Premium Bread; Woman's Drudgery; Portable Kitchen; Extract of Coffee; 380.

MISCELLANEOUS.—James Davenport Whelpley; Mining Companies' Reports; The Institute of Mining Engineers; Important Mining Decision; An "International Laboratory," 370. Vienna World's Fair, 374. Patents and Inventions; New Incorporations; Increase of Capital Stock; Meetings and Elections, 380.

Heavy Blast.—Dispatches from Dutch Flat dated the 9th inst., state that a blast of 2,500 pounds of Hercules powder was exploded in the Gray Bro's. claim on that day. The entire hank, 77 feet high and containing 142,000 cubic yards of firmly cemented gravel was thrown down. The powder was from the California Powder Works. The drifts were under the superintendence of J. W. Millard, of the powder company, and the hlast was fired hy E. H McClure, hy electricity.

Alaska Coal.—The hill for the sale of coal lands has been amended so as to exclude Alaska; for what reason we are not informed. It is understood that there are extensive coal fields in our newly acquired Territory, and we see no reason why citizens might not purchase mines there as well as any where else in the United States. We import large quantities of coal, and new fields properly opened in our own country would he advantageous not only to the owners hut to consumers.

Libraries for the People.—Austria has decided (in her new school-law) to attach libraries to public schools, these libraries to he open not only to the scholars hut also to adults under certain conditions. In the country this will be of great importance, and in this educational measure Austria leads other nations. In order to aid in the formation of such libraries, societies and private individuals are subscribing considerable sums of money.

Nevada Foundry.—McCone's Foundry, near Silver City, Nev., which was destroyed hy fire a short time since, is not to be rehuilt, but the owner has purchased the Fulton Foundry on the Divide and will continue his business there. The establishment is in good order and contains first class machinery capahle of turning out all classes of work.

On File.—"Nevada State Mines."

Narrow Gauge vs. Wide Gauge.

It is becoming more apparent every day to the people of this Coast that we are in great need of cheaper railroads—railroads which, if bnilt by others for us, can be oonstructed without the necessity of enormous subsidies; best of all, railroads which can be built by the people for the people.

The cost of roads of the present common gauge cuts off without question many regions from the hope of railroad transportation for years to oome. To pay $50,000 to $70,000 per mile for construction is far beyond the ability of the inhabitants. Roads cannot be run thither nntil the population is far greater, and population will not go thither until the roads are built—which looks bad for the "rapidly growiug prosperity," of which we are so fond of talking, of those sections.

The question has often been mooted as to the possibility, in such cases, of constructing narrow gauge roads, and as to the economy of such over those of wide gauge. The controversyhas been actively carried on dnring the past two years. We all were very mnch interested when the people of Grass Valley and Nevada City undertook to investigate the matter practically, and we all were very much disappointed when they failed to reach a solution with which the public could feel satisfied.

In that discussion both roads projected, one of wide and one of narrow gauge, had the same location (made particularly for the wide gauge) and very much the same construction; of conrse no advantage was found for the narrow gauge. And so, only too often iu the controversy, the main argument adduced by the wide gauge upholders is in effect that if we build a narrow gauge road with the same location, road bed and superstructure, and essentially the same rolling stock as for the wide gauge, we shall have no ecouomy—"which nobody can deny." But then this is just the manner in which no one thinks of building a narrow gauge road.

We refer again for the hundredth time to this matter because we have the opportunity to give some figures in addition to those which we have already published. Notwithstanding opposition, we have already one road of importance constructed (and running) on the narrow gauge plan, and new facts are being ascertained continually, which put the question in a clearer light.

Gen. Geo. P. Buell, Chief Engineer of the Texas Pacific Railroad, in a report to the Directors of the road, spoke very favorably with regard to the narrow gauge. His report was attacked by Mr. S. Seymonr. To this gentleman's argument, which we have not seen, we may do injustice, but from what we have heard of it we may judge it to be in the old circular style:—Yon cannot economize by building a narrow gauge road, because it costs as mnch as it does to build a wide gauge road.

Mr. C. J. Quetil, Prin. Assist. Engineer nnder Gen. Buell, has written a reply which seems to give some very conclnsive reasoning in favor of the narrow gauge. We have not space to give his argument in full, for which we must refer those interested to *Van Nostrand's Mag.* for May, but we give for the benefit of many, some of his figures and deductions with the assurance that these appear to be fairly arrived at.

Cost of Road Beds.

For the purpose of a fair estimate between the two gauges of the cost of earthwork, we will take the average hight of embankments as 6 feet; slope, 1½ to 1; width at top, 14 feet (as generally built) for the 4 feet 8½ inch gauge, and 9 feet for the 3 or 3½ feet gauge; cuts as 5.4 feet high and 18 feet wide respectively; bridges 16 feet and 12 feet wide. We find then the following economy in narrow gauge roads in per ct. (A) of cost of narrow gaugue, or (B) of cost of wide gauge.

	A	B
Earthwork.....30 per ct.	or 22 per ct.
Clearing and Grubbing..... 8⅓	" " 8 "
Drain boxes.....19	" " 16 "
Bridges and culverts.....33	" " 25 "
Loose and solid rock, and hauling.30	" " 23 "

To apply these figures to the Texas Pacific R. R. The cost per mile, between Camp's Ferry and Tyler, of clearing and grubbing, earthwork, loose rocks, hauling, culverts and bridges was $16,506.77. The economy per mile with a narrow gauge would be $3,763.35. As it is calculated that the road will be at least 2,000 miles long, the economy for that length would be $7,526,700.

Even if we make the embankments 10 ft. wide, cuts, bridges and culverts 14 ft. wide, for the narrow gauge we shall have a great economy over the wide gauge, as follows:

Earthwork.....16	per ct. of wide gauge
Clearing and grubbing.....6⅔	" "
Bridges and culverts.....12⅔	" "
Loose rock, solid rock, hauling..16	" "

Consequently the economy per mile, would be $2,432.42, or $4,864,840 for the 2,000 miles of road.

The economy of construction of road-bed is, if the banks are 9 ft. and the cuts 12 ft. wide, equal to 23 per cent. of the cost of wide gauge roads; or, if the banks are 10 ft., and the cuts and bridges 14 ft. wide, equal to 15 per cent. of the cost of wide gauge roads.

Superstructure.

The rail used on the Denver and Rio Grande, and on most of the 3-ft. gauge roads is a 30 lb rail. Gen. Buell recommended a 36-lb rail for a 3 ft. 6 inch gauge. If the rails are lighter, spikes and bolts will also be lighter, and the ballast will be used in smaller quantities. We give here the comparative costs of superstructnre of two roads, one with a 4-ft. 8½ inch gauge, and 55-lb rail, the other with a 3-ft. 6 inch gauge, and 35-lb. rail.

WIDE OAUGE.

87 tons of rails at $70.....	$6,090.00
400 rail splices at $1.....	400,00
5,500 lb. spikes at 5 cts.....	275.00
2,640 cross ties at 80 cts.....	2,112.00
2,000 cu. yds, gravel hallast at 50 cts.....	1,000 00
Laying one mile of track.....	500.00
Total per mile.....	$10,017.00

NARROW GAUGE.

55 tons of rails at $75.....	$4,125.00
528 rail splices at 60 cts.....	316.00
3,520 lb. spikes at 6 cts.....	211.20
3,520 cross ties 5'x5"x6" at 50 cts.....	1,408.00
1,200 cu. yds. gravel ballast at 50cts.....	600.00
Laying one mile track.....	350.00
Total per mile.....	$7,011.00

Hence the ecouomy of the superstructure is $3,366 per mile, or nearly 45 per cent. of the cost of narrow gauge, and 32 per cent. of the cost of wide gauge for superstructure. This, for the 2,000 miles of the Texas-Pacifio, wonld amount to $6,732,000. Adding the economy in the road-bed, we have a total economy of $14,258,700, if the banks are 9 ft. wide, or $11,596-840 if the banks are made 10 ft. wide; and this, on ordinary railroad gronnd. *It is principally in countries like New Mexico, Arizona and California,* which the line will have to cross, that the company might make an *immense saving* by adopting the narrow gauge.

The adoption of a narrow gange allows sharper curves for the line, and saves, furthermore, mnch of the heavy expense of tunnelling.

Official Statements from other Roads.

J. P. Mersereau, Chief Engineer, submitted to Gen. Palmer, President D. & R. G. R. R. Co., the following estimate of cost for a broad and narrow gauge road from Golden City to Black Hawk, Colorado. On the wide gauge (4 ft. 8½ inches,) the maximum grade was 155 ft., maximum curve 12°; on the narrow gauge (3 ft.), maximum grade 175 ft., maximum curve 26°, distance, 20 miles.

	Wide Gauge.	Narrow Gauge.
Graduation, masonry bridging and ballasting.....	$46,425.....	$7,200
Superstructure, track, etc....	13,610.....	8,765
Depots, repair shops, tanks...	1,220.....	1,000
Engineering, superintendence and contingencies.....	4,500.....	1,500
Total cost per mile.....	$65,755.....	$18,465
Difference in cost per mile.....		$47,290
Difference in cost for 20 miles.....		$945,800

"These estimates are made from careful surveys, the most of the lines being actual locations; the covered lines having been run at all the most difficult points." The rails are estimated at 65 pounds, for broad gauge, and 40 pounds for narrow gauge. "There would appear to be a discrepancy in the engineering and contingenoy estimate (by comparison), bnt is accounted for by the difference in length of time to constrnct; there being unavoidably 3 tunnels on the broad gauge (if only 12° curves are used), which would keep up an organization for engineering 2 *years instead of* 6 *or* 8 *months*, in which the narrow gauge can be completed. The extension of line from Black Hawk to Central City can be made at the average cost for narrow gauge given, distance about 7 miles, but I think it *hardly possible* to build for broad gauge with 12° curves."

The Denver and Rio Grande Railway uses

Width of road bed in cuts.....	12 feet
" " banks.....	10 feet
Sharpest curve.....	6 deg
Maximum grade per mile.....	75 feet
Length of ties.....	6½ ft
Weight of rail per yard.....	30 lbs
Slope of earth cuttings.....	1 to 1
Slope of banks.....	1½ to 1
Slopo of solid rock cuttings.....	¼ to 1

After 5 miles had been graded on a road from Golden City to the forks of Clear Creek, Colorado, T. E. Sickes, Chief Engineer, Colorado Central R. R. (Gen. Supt Union Pacific R. R.) wrote: "The cost of grading a road-bed through the cañon for a 4 ft. 8½ in. track was estimated to be $90,000 *per mile.* The *actual cost* of grading a road-bed for a 3 ft. track *has not exceeded* $20,000 *per mile.*" When asked for explanation concerning this difference, which was "considered somewhat extraordinary," he wrote that the difference was due to the different locations of the two lines. The minimum radius of curvature adopted for the broad gauge was 955 ft; for the narrow gauge, 220 ft. "The cañon is about 3,000 ft. deep and has precipitous sides. Its course is so tortuous that the broad gauge location would have required in construction numerous tunnels and bridges, with high embankment aud deep opeu rock cuttings. The adoption of a narrow gauge admitted of an alignment conforming approximately to the windings of the cañon and enabled us to obtain a graded road-bed for less than ¼ of the estimated cost of a broad-gauge road bed, with the additional advantage that increase of distance secured more favorable grades.

This last has a great significance for those among the mountains of our coast.

Rolling Stock.

We must pass over the argument concerning the stability and gain in regard to dead weight of the narrow gauge cars, and the performances of the engine, etc., for want of space. Mr. Quetil wonders that, in view of its performances the Fairlie engine has not become more popular in this country. We give some dimensions of cars which have been built for the narrow gauge roads.

Passenger Cars:—35 ft. long, 7 ft. wide, 6½ ft. high, carrying 36 passengers. For wide gauge there are 54 ft. long, 9½ ft. wide, 10¼ ft. high at dome, carrying 60 passengers.

Platform Cars:—4-wheeled; 12½ and 16½ ft. long, 6 ft. wide.

Platform Cars:—8-wheeled; 23½ ft. long and 6 ft. wide. For wide gauge these are 32 ft. long and 9 ft. wide.

Box Cars:—4-wheeled; 10, 12 or 14 ft. long and 6 ft. wide.

Box Cars:—8-wheeled; 22 ft. long, 6½ ft. wide. For wide gauge, 29 ft. long and 9 ft. wide.

There is in favor of the narrow gauge an economy of dead weight of

For flat cars.....	42.4 per cent.
For 4-wheeled box cars.....	33.1 "
For 8- " "	25.4 "
For passenger cars.....	234 lbs. per passenger.

In regard to the inconvenience of breaking bulk, so often dwelt on by opponents of the narrow gauge, this is compensated for a hundred times by the other advantages, to say nothing of the great damage and inconvenience growing out of an interohange of cars upon thousands of miles of connecting, and often hostile or competing lines.

What the Country Would Save.

Gen. Rosecrans has made some interesting calculations tending to show that if the railroads in the United States, down to the end of 1867, had been bnilt on the narrow gauge plan, the saving in first cost would have been $480,000,000, the annual interest of which at 6 per cent. is 28,800,000; that the annual saving on haulage would be $100,800,000; in all an annual saving to the people of the United States of $129,600,000.

He shows frnther that a much greater saving is in question for the future; for,

he reasons, provided the whole country is to be as well furnished with railroads as is the State of Ohio, there will be a total length of 165,800 miles of roads, the annual saving on which with the narrow gauge system would be $547,544,515—enough to pay the national debt in 5 years.

Moreover, he shows that railroads, on the average, add $10 per acre to the value of lands within 10 miles of them. The narrow gauge roads can be afforded in districts where broad gauge roads could not, to an extent which it is moderate to call 30,000 miles; which would add to the value of the land bordering on these roads $3,000,000.

Mechanics' Institute.

The regular annual meeting of the Mechanics' Institute was held on the 6th inst. The annual report of the President, A. S. Hallidie, was read after the transaction of some business of minor importance. He said that at the time of his annual report the year previous that the liabilities of the Society were $40,013.48; the largest item being $37,000, due the Union Insurance Co., for which they held a mortgage on the Society's property. This mortgage has been reduced by the transactions of the year to $5,000, and still further reduced by money received from life memberships, amounting to $2,000. He urged the propriety of getting 60 more life members, so as to clear the institution of debt. He also urged the idea of increasing their mineralogical cabinet from its present size. He thought the Trustees would do right to continue to keep open the library on Sundays, the experiment having been a success. The matter of future Industrial Exhibitions had been considered by the Trustees at different times, and they were unanimously of the opinion that a permanent structure should be obtained, but as yet no plans had been offered which met their approval. The library now contains 17,239 volumes. The number of new members during the year was 375.

Finances.

The financial statement of the Society for the year ending May 31st, 1872, was as follows:— Institute Fund: Total receipts, $14,844.33; disbursements, $15,164.17; due Treasurer, $319.84. Sinking Fund: Receipts, $2,820.89; disbursements, $1,214.73; balance on hand, $1,606.16. Pavilion Account: Receipts, $20,753.96; disbursements, $19,025.87; transferred to Institute balance, $1,728.09. The assets of the Society are stated at $146,628.81; liabilities, $6,424.28; net assets, $140,204.53; monthly revenue, $1,091; expenses, $995.

Installation of Trustees.

The new Trustees were duly installed by the Installation Committee, Mayor Alvord Chairman, after a few remarks by Irving Scott. The Trustees are: A. S. Hallidie, Henry L. Davis, Asa R. Wells, R. B. Woodward, A. S. Iredale, Geo. Spaulding and Samuel H. Wheeler.

The Trustees elected A. S. Hallidie President; J. C. Patrick, Vice President; H. L. Davis, Treasurer; H. W. Joncs, Corresponding Secretary, and S. H. Wheeler, Recording Secretary.

The re-election of Mr. Hallidie as President continues him as an *ex officio* member of the Board of Regents of the State University.

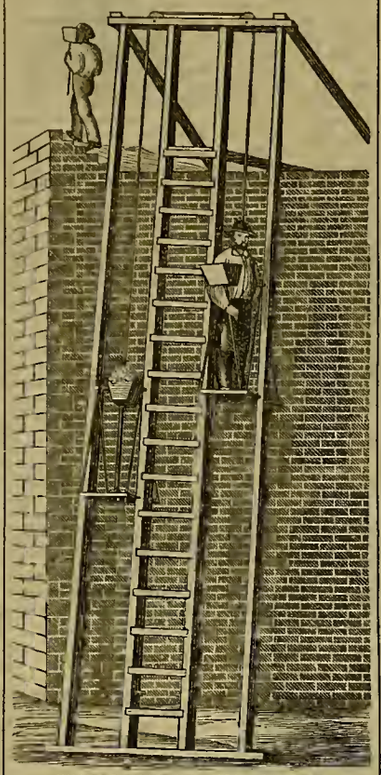
Miner's Lamp.—A Londoner has recent patented a lamp, more particularly for coal miner's use, which is so constructed that it can not be opened without first extinguishing the light. This is effected by adapting to the body of the lamp a locking pin which will prevent the lower part from being unscrewed or detached from the upper part until the pin is drawn back.

Fire.—On the 30th ult. the buildings surrounding the galmadore of the Cerro Gordo Smelting Works was totally destroyed by fire. This is the second time, these building have been burnt. The loss amounts to about $4,000.

Knapp's Hod Carrier.

The illustration shown herewith represents a device which is intended to facilitate the hoisting of bricks, mortar, and other materials to the top of buildings, in the course of construction. The invention is a simple one and can be easily understood by referring to the cut. An ordinary ladder is used with a timber on each side, and secured at top and bottom, by cross beams. The ladder and side pieces are mortised into the cross beams, but not fastened, so that the machine can easily be taken apart for transportation or when it is desired to use the ladder separately.

In the top beam are two pulleys over which passes the rope to which the cages are suspended. The cages are made with a board or plank bottom, and a short piece of scantling at the top, connected with hoop iron and held in their places by small iron guides which run in front and back of the timbers. One of the cages being loaded, it is raised to the top of the building by a workman who steps into the opposite cage and rides to the bottom. The machine can be used by one man, but two or more men can use it to better advantage. It will be seen that the operator is obliged to climb the ladder once for every load that he raises, but having no burden to carry, he ascends in much



KNAPP'S PATENT HOD CARRIER.

less time, and the labor is comparatively light. It requires but a few seconds to descend, and the workman regulates his speed by placing his hand upon the side timber. By the old method nearly as much time is consumed in descending the ladder as in carrying up the load. The first device constructed of this kind is now in use at the new depots of the Central Pacific Railroad Company on Fourth street. These buildings are being roofed with asphaltum, and the contracter, Mr. N. P. Perine, who has procured this machine, formerly used a block and tackle for the same purpose. We are informed that by the use of the block and tackle three men raised seventy-five pounds per minute, and by the use of this new device two men raised 150 pounds per minute.

For buildings of one or two stories the machine can be used as represented in the cut, but for higher buildings, four ropes are used in place of the timbers and the cages are provided with eye holds on each side through which the ropes pass, and keep them in position. The men can then ascend in the usual way by ladders from one scaffold to another.

It is the intention of the inventor to manufacture small sizes for the use of farmers and warehousemen. Full particulars regarding the machine and its uses can be obtained of Wiester & Co., 17 New Montgomery street, in this city.

Paying Mine.—The shipments from the Raymond & Ely mine for June, up to the 12th inst., amount to over $10,000 per day.

Tule Plowing—A New Invention.

The tule gang plow of Mr. McCall, of Santa Clara Co., has been practically at work at the upper end of Puget Slough, Old River, west side of the San Joaquin, some sixteen miles east of Antioch.

There are six plows formed of sheet iron or steel, gouge shaped, and set so as to hold themselves down to the work, while the wheels of the machine prevents them from going too deep. The plows cut the soil in continuous ribbons, about two inches deep and several wide, turning some wholly, and some only partially over.

The wheat seeds are dropped so as to be covered by this process. There is no question about its springing up, the cut sods acting as a protecting mulch. The possible difficulty anticipated, if any, in this mode of culture, will be the springing up of the grass also through the sod, and its disputing the possession of the ground with the grain.

Mr. Sherman Day, our witness of this information, said the plow seemed to do the work intended very well, cutting and turning down a growth of tules, in some places some four feet high, without previous preparation. The grass sod cut forms a sort of peat.

Two four horse teams were worked, plowing two and one-half acres each a day, as estimated, the cuts being one-half mile long.

A patent has been applied for by Mr. McCall on his plow through the Scientific Press office. With improved implements, and a more thorough knowledge of our tule lands, and the capacities of the soil and climate, they are constantly gaining in fame and importance in our community.

An Adjustable Gearing.

The accompanying cut represents a device of Dr. A. Blatchley's, of San Francisco, for an adjustable gearing. So far as he is informed it is an original mechanical movement. The shafts to which it is attached may be turned in different directions and the gearing will

A NEW MOVABLE GEAR.

still run regularly. We judge that it may prove a very useful device, from its great simplicity, for some special purposes. The Doctor, who has taken out many patents, originated this idea in connection with his researches in perfecting his drilling machines, and its connected devices for transmitting power at different angles.

Railroad Improvements.—The Central Pacific Railroad Company have recently completed two freight depots in this city, between King and Townsend and Fourth and Fifth streets. One of the buildings is 500 feet long and seventy-five feet wide, with a shed on each side. The other depot is 500x50 feet. When entirely completed the building will be 800 feet long. The business office is in the second story of one of the buildings. The space between the buildings for the tracks is 120 feet. A new depot is now being constructed at the Yatch Club house near the long pier, and the drawbridge across Channel street is completed so that as soon as the filling in between the latter depot and the bridge is done the tracks will be laid. All freight over the C. P. R. R. line will hereafter be handled at the new depots.

Iron.—The scarcity and high price of iron has had the effect to make the collection of "scrap" quite an object, and the up country towns are sending all the available old iron to this city for the Rolling mills. Old pieces of agricultural and mining implements hitherto thought useless, are now finding their way to the city at some profit to their owners.

Sutro Tunnel.—The House Mining Committee have recommended that the Government guarantee the interest of the company's bonds; and also make an absolute lien of $2,000,000 at the rate of $50,000 for each 500 lineal feet completed, provided that an equal amount has been expended by the company on the same work.

The Paul Process—An Important Practical Test.

Mr. Almarin B. Paul, inventor of the new dry amalgamating process, known by his name, has been for the past five years perfecting his system of working ores, and has at last succeeded in giving it a practical test as compared with the copper-plate system of working gold ore. The process has been introduced into the mill of the Calaveras Gold Mining Co., whose property is near Murphy's Calaveras County, Cal. In order to be thoroughly satisfied as to the merits of the invention they concluded to make a practical test of it in comparison with the workings of a 10-stamp California mill with copper plates, etc.

With this object in view they took from the same place in the mine, just as it came, 37½ tons of rock. The battery was cleaned up thoroughly, and 19½ tons put through dry for the new process, when it was again cleaned up and the remaining 18 tons run through in the usual way. The result was as follows:

Paul Process	58.44½ per ton
Wet working battery, copper plates, etc.	$23.33½ " "
Difference in favor of Paul process	$35.11 " "
Amount of bullion by Paul process	$1,139.70
" " " Copper plate process	420.21

The latter figures show a greater proportion in favor of the new process than the small amount of 1½ tons more could make, while the former figures show a gain of over 111 per cent. The machinery of the new system which we described some time since, is arranged to take the ore and dispose of it as fast as the stamps reduce it—all working of course together. One man can attend to it after rock is fed into the batteries. The capacity of the mill which made this run is 6 tons in 24 hours. The expense of working is less than by the pan, and not quite $2 per ton more than by the copper plate system.

As to original cost of machinery, etc., the following estimate will be found sufficiently accurate for all purposes. Cost of machinery for pan working mill, as per foundry estimate to reduce ten tons per twenty-four hours, not including cost of motive power, etc.

10 stamps with pullies, etc	$1,800
6 pans—$400 each	2,400
3 settlers—$400 each	1,200
Belting, pipes, etc	600
Wood work and extras	2,000
Total	$8,000

This will require about eighteen-horse power.

Cost of machinery of a "Californian" ten-stamp mill with copper plates, (no pans) to reduce ten tons per day through No. 7 screen, or No. 60 wire cloth, with 3,600 holes to square inch.

10-stamp battery	$18,000
Wood work	2,000
Extras, say	1,000
Total	$4,800

Expense of machinery for Paul's process, based on five stamps, reducing two tons per stamp in twenty-four hours, through No. 14 wire cloth:

5-stamp battery	$900.00
Pulverizing, preparing and amalgamating barrels, settlers, vibrating tables, belting, pipes, etc., as furnished with mills	4,000.00
Wood-work, etc., (about)	750.00
Total	$5,650 00

This would require 14-horse power to run it. The reduction by the latter system is not less than through *No.* 80 wire cloth, or 6,400 openings per square inch, being about 100 per cent. finer than ore worked the usual way in a battery.

Any miner will readily see that Paul with his five-stamps and *No.* 14 wire cloth, can reduce as much as a 10-stamp mill washing through *No.* 60 wire cloth. The pulverizing and preparing barrel intervening between the stamps and amalgamater, is made of such power and dimensions as to reduce the quartz as fast as delivered to it from the stamps, and down to not coarser than, *No.* 80 wire cloth, with 6,400 openings to the square inch; while a large proportion of it will pass through *No.* 100 mesh, or 10,000 openings to the square inch. The *No.* 14 wire cloth is of course where the ore passes from the battery before it goes to the revolving barrel, and the ore passes from the barrel through not less than *No.* 80 wire cloth.

DOMESTIC ECONOMY.

Hints about House Cleaning.

In a general house cleaning, carpets that do not require to be taken up should be loosened at the edges, and the dust removed therefrom, and a good lookout made for moths. If there are any traces of moths wash the floor with benzine or sp. of turpentine, and put the carpet down quickly, and the insects will get their quietus.

Straw matting should be washed with a cloth dampened in salt water. Take care to wet it but little, for if the matting is soaked through it is liable to become brittle and soon give out. If Indian meal is sprinkled over it, or damp sand, and then thoroughly swept off, it will operate with good effect.

In washing windows, a narrow-bladed wooden knife, sharply pointed, is the best thing with which to take out the dust that harbors in the corners of the sash. Dry whitening will polish the glass nicely, and a weak black tea, with some alcohol is the best liquid with which to *wash* the glass. For a few days before the cleansing takes place, save all the tea grounds; then when needed, boil them in a tin pail with two quarts of water, and use the liquid on the windows. It takes off all the dust and fly specks. If applied with a newspapaer, and rubbed off with another paper, they look far better than if cloth is used.

If there are old feather beds in the house, and no machine renovator at hand, put them out in the first heavy, drenching rain that falls. Let them become thoroughly wet and then turn the bed several times; then dry them in the sun, and when one side is perfectly dry, beat it with sticks to lighten up the feathers, and turn up the other side to dry; either placing boards under it or putting the beds on the piazza roof, if one is at hand.

To take out stains from either mattresses or feather beds, make a paste of soft soap and starch, and spread over the spots: when dry, scrape off with a knife, washing it with a damp sponge, as it falls off; if not clean, put on another paste. This application, if repeated frequently, until all discolorations are gone, will purify any bedding. Cockroaches can be kept away with powdered borax. Keep it in a tin pepper box and sprinkle it wherever they go. Paris green is recommended, but it is a poison; while borax is harmless. Sprigs of wintergreen, or ground ivy, will drive away small red ants, and branches of wormwood will make black ants "vamose the ranch."

Scald your bedsteads in the hottest soapsuds you can apply; if there are traces of bugs apply kerosene with a small paint brush. It is a sure cure. Tenants of city houses are often annoyed by buge, and can not tell whence they came. Perhaps the border of the wall-paper might divulge their source, or the cornices of the windowe disclose their haunts. Again apply kerosene and they will no longer trouble you. Carbolic acid may be applied. If pure, the odor is not as disagreeable as that of coal oil.

Papering and painting are best done in cold weather, especially the latter, for the wood absorbs the oil or paint much more than in warm weather, while in cold weather it hardens on the outside, making a coat, which will protect the wood instead of soaking into it.

In papering walls, be sure to remove all the old paper and paste, and scrape them perfectly smooth. The best paste is made of rye flour, with two ounces of glue dissolved in each quart of paste; half an ounce of powdered borax will make the paste better. People now generally understand how dangerous it is to paper a wall over old paper and paste. Many deaths have arisen from this cause; the air of many sleeping-rooms has been thus poisoned.

In whitewashing, a pound of glue dissolved in hot water and diluted with four gallons of cold water, to which is added six pounds of whiting, will be found to answer a better purpose than common lime. Wood-work can be washed with this glue size, and one coat of paint on it would last for years. A little chrome yellow will give a light lemon-colored tint to the wash.

A cheap paint for the floor can be made, which a strong, smart woman could apply to any floor: five pounds of French ochre; one-fourth of a pound of glue, and a gallon of hot water. Dissolve the glue in a small quantity of hot water; when wholly melted add the rest of it, stirring it slowly until well mixed. Then stir in the ochre, and apply while hot, with a good-sized paint-brush. When well dried apply one or two coats of boiled linseed oil. This paint dries very quickly, hardening in fifteen to twenty-four hours. It is very cheap. An oaken hue can be given to new pine floors and tables, by washing them in a solution of copperas dissolved in strong lye, a pound of the former to a gallon of the latter. When dry this should be oiled, and it will look well for a year or two; then renew the oiling.

Grease can be extracted from floors by applying a paste of wood ashes and quicklime, to be kept on several days and then washed off. Stains on wall paper can be cut out with a sharp pen knife, and a piece of paper so nicely inserted than no one can see the patch.

Ink stains on wood can be removed by a solution of oxalic acid. Cover the spots with bits of the acid, turn on a spoonful of water and place a heated flat-iron over it; when the hissing ceases the ink will have disappeared.

Kerosene and powdered lime whiting, or wood ashes, will scour tin with the least labor. Kerosene and whiting will also clean silver-ware, door-knobs, hinges, etc. Wet the flannel slightly in oil, dip in the whiting, and rub hard; wash off with a chamois skin or newspaper. Spots can be taken out of marble with finely powdered pumice-stone. Mix it with verjuice, cover the spots with it, and let it remain for twelve hours; then rub clean with a damp sponge; rinse with clean water and wipe dry, with a cloth. Soapstone hearths should be first washed in pure water and then rubbed with powdered marble or soapstone, put on with a piece of the same stone. Gray marble hearths can be rubbed with linseed oil and no spot will show. If gilt frames are varnished with copal varnish, they can be washed with cold water without injury. Lace curtains should never be ironed. Wash and starch them, using in the rinsing water a tablespoonful of powdered borax. This makes them very stiff. When wet spread on a sheet, either on the floor or bed, and pin down every two or three inches. Let them dry for several days and they will look very nice.—*Country Gentleman.*

What Food is Most Wholesome?

Dio Lewis is probably the best doctor in the country for advising people how not to get sick and need other doctors. This is his conclusion as to food:

For Breakfast.—Oatmeal porridge with milk and sugar.

Or, Graham mush, with a little good syrup.

Or, cracked wheat with milk and sugar.

Or, baked potatoes with bread and butter.

Or, beefsteak or mutton chop, with baked potatoes and bread and butter.

If you are thin and need fat, use the first three; if you are too fat use the last named two.

Drink cold water or a little weak coffee.

Dinner.—Beef or mutton, roasted or stewed, with any vegetables you may like (though tomatoes should be used sparingly) good bread and butter, and close the meal with a glass of weak lemonade. Eat no desert unless it be a little fruit, and eat nothing more until the next morning.

There is no rule in regard to diet about which I am so fixed in my convictions, as that nothing should be eaten after dinner, and I think that the dinner should be taken early in the day, not later, if it can be so managed, than 2 o'clock. In regard to the precise hour of the dinner I am not so clear, though for myself 1 o'clock is the best hour; but in reference to the omission of the third meal, I have, after long observation, no doubt whatever.

Hundreds of persons have come to me with indigestion, in some of its many forms, and have experienced such relief in a single week from omitting the supper that I have, for a number of years, depended upon this point in the diet as the best item in my prescriptions for indigestione. I have never met one person suffering from indigestion, who was not greatly relieved at once, by omiting the third meal.

Eat nothing between meals, not even an apple or peach. If you eat fruit let it be with the breakfast and dinner.

Cooked fruit is best for persons with weak digestion. I have met hundreds of people who would digest a large beefsteak without a pang, but could not manage a single uncooked apple.

I think certain dietetic reformere have somewhat overrated the value of fruit.

Avoid cake, pie, all sweetmeats, nuts, raisins and candies.

Manage your stomach as above, and at the end of ten years you will look back upon these table habits as the source of a great advantage and happiness.

For thirty years I have been a constant and careful observer, (I have no hobbies about diet) and in the light of my own experience and these long observations, I assure you the table habits I advise are vital to health and happiness.

PREMIUM BREAD.—At a National Health Reform Association held not long since in New York, a premium of $100 was awarded to Mrs. R. T. Thrall. The bread was made as follows:—Mix unbolted wheat meal (freshly ground) with pure *cold* water, to make a stiff dough; knead the dough thoroughly, working in as much as possible; cut into small pieces and bake in a quick oven. It will bake quicker and keep longer if made into rolls a little larger than the finger; or into cakes one-half or three-fourths of an inch in thickness, two inches wide, and three inches long. This bread may be dried as hard as a brick and kept sweet and good for weeks. You have only to dip it in water a minute, and let it stand five minutes to have as tender, wholesome and delicious bread as need be eaten.

WOMAN'S DRUDGERY.—The general introduction of a more simple and wholesome plan of cooking would greatly relieve woman of her present hard toil and drudgery, while it would promote the health of every member of her household. At least four-fifths of all the money expended for medicines and medical advice, are paid because of the diseases of women and children. And, nine-tenths of all the care, nursing, night-watching, and privation of sleep and rest because of sick children, are performed and suffered by women. The Medical Society in New York, which, on one of its festive occasions toasted women in the following words, had truth if not poetry as the basis of the sentiment.

"*Woman,*—God's best gift to man, *and the chief support of the doctors.*"

Portable Kitchen.

A very useful device is extensively used in some parts of northern Europe, by workmen and others who have occasion to carry their meals with them to their places of work. This device consists of two parts, one a pot of tin, intended to receive the principal portion of the food, and a box, lined inside with non-conducing material, in which the pot is placed, so as to be protected against loss of heat.

It is used as follows: The food to be cooked is placed in No. 1,—meat, vegetables, water, salt etc.; some portions may also be placed in a smaller pot, which may be placed inside of the larger one. The two pots should then be placed on the fire till the water boils, the boiling being kept up for 20 to 30 minutes in accordance with the character of the food. The pot is then taken from the fire, closed with a cover, and at once introduced into the box. The cover of which is then closed and the box set aside, or taken with laborer to his work. After six hours the cooking is finished, and the food in proper condition to be eaten; but there is no objection to leaving it longer, as it cooks exceedingly slow, and retains all its flavor. Numerous experiments have demonstrated that after twelve and even 18 hours beef and soup were sufficiently warm, and had lost nothing in regard to their quality.

All kinds of food which do not require roasting or frying may be prepared in this apparatus; dry vegetables, potatoes, rice and milk, mutton, or veal pie, beef *a la mode*, leg of mutton, chicken stew, etc., may be prepared with economy of fire and of time. As there is no evaporation, the food thus prepared is of better flavor than that cooked in the customary way.

The advantages of this portable apparatus are: 1st. Economy of fuel, saving from 50 to 70 per cent. 2d. Economy of time and trouble, as after the food is placed in the box it needs no more looking after, as the whole operation completes itself by the heat retained. The laborer's wife may in the morning at six, while she prepares breakfast, cook the dinner, and after 30 minutes' cooking put it all in the box. The husband carries the box with him to his shop, or any other place, and is sure of a warm well-cooked dinner a 12. 3d. The dinner can never be burned or taste of smoke, dangers which housewives and cooks have to look out for, and which occasionally befall the best-regulated households. 4th. The taste is better than that of meals prepared in open vessels, where the flavor is continually escaping with the steam. 5th. The convenience of transporting such an arrangement to the factories, shops, or on the railroad cars, or even to picnics. 6th. The certainty of a warm meal, which is much more healthier than the cold food, with which so many laboring people have to satisfy themselves.

Some hardware manufacturer should take hold of these ideas, and furnish such arrangements at such reasonable prices that all our workmen may procure them. We feel confident that with the progressive ideas of our population, their introduction would soon be appreciated, and secure at the same time a profit to the manufacturer and dealer, and a practical benefit to our workmen, whose health and comfort we are all in duty bound to promote as much as is in our power.

Extract of Coffee.

This may be made in two ways. The first way gives less, but a very highly and very pleasant aromatic extract; the second gives more and of greater strength, but of less pleasant flavor. The difference is found on the fact that cold water dissolves the more agreeable ingredients, while boiling water takes all the bitter principles of less agreeable flavor.

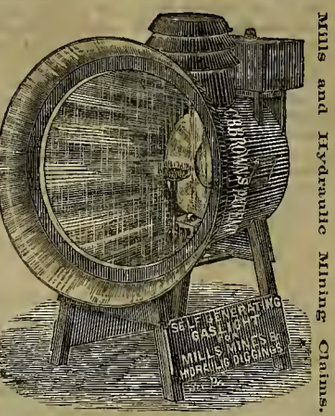
The first extract is made by placing the coffee in a deep narrow filter, and passing cold or tepid water through. For greater economy the coffee may be divided into a series of filters, and treated in succession with the same liquid. To understand this, call them *a, b, c, d, e;* the liquid from *a* goes to *b*, then in *c*, etc.; *a* receiving always the clean water, is first exhausted and rejected, when *b* becomes No. 1, and a fresh filter, *f*, is added, to receive the liquid from the others; after a while *b* is rejected, and *c* becomes No. 1, while we add again a last freshly-filled filter, *g*, and so we go on. The liquid obtained is condensed by evaporation, and may be sweetened with sugar, but if sufficiently condensed to the thickness of syrup, it will keep without sugar, and is a most desirable thing when traveling. It may be mixed with the sugared condensed milk, prepared in tin cans, and then will keep any length of time, and always be ready to make a most delicious cup of hot or cold coffee, with hot or cold water.

The second method is to boil one pound of good coffee with a half a gallon of water, till reduced to a pint; let it cool, and filter, and then boil again, and add enough sugar to make a thick syrup; cool it, pour in a bottle, and cork up. Two teaspoonfuls of either of these extracts will, with a cup of boiling water, make a good cup of coffee.

It is evident that with the second method we have much fine flavor carried off by evaporation during the boiling, and have this compensated for by ingredients dissolved by heat. In order to become satisfied about the inferiority of the second method, take the grounds left from the cold filtering process, and boil them to make a coffee extract according to the second method, and a syrup is obtained, which is not only inferior, but when mixed with water, makes an absolutely disagreeable beverage.

BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

C. B. BROWN,
7v24-t Placerville, Cal.

THE TANITE COMPANY,

STROUDSBURG, PA.,

Sole Manufacturers of

THE TANITE EMERY WHEEL,

And builders of Emery Grinders, Saw Gummers, Etc., Etc.

Emery Grinding Machines,

At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.

SOLID EMERY WHEELS,

From 40 cents to $113 each.

Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of castings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off chilled edges, to finish nuts, etc., etc. Every BRASS WORKER can use them on Brass. Every WOOD WORKER can use them to gum his saws, to sharpen his planer knives, to make his moulding cuttere. For illustrated circulars address THE TANITE Co., Stroudsburg, Monroe county, Pa.

THE FREAR STONE COMPANY
OF CALIFORNIA.
Office, 638 Market Street.

OFFICERS:

JAMES GAMBLE, President. | L. A. BOOTH, Treasurer.

EXECUTIVE COMMITTEE:

N. W. SPAULDING, GEORGE C. POTTER, N. P. PERINE.

This Company will contract to furnish or put up the heaviest, strongest and most elaborate and elegant Fireproof Stone Fronts, of any design, and every style of Plain and Ornamental Door and Window Caps, Keystones, Sills, Water Tables, Coping Ashlars, Plain and Ornamental Stone Work of every description. Fireproof Buildings and Bank Vaults, Cemetery Work, Curbing Stones, Fountains, etc., all at prices far below native cut stone, and equal, in all respects, as to strength and durability.

Architects and Builders, before letting their contracts for Stone Work, are requested to call at the office of this Company, and examine certificates, specimens and photographs of buildings already constructed of Frear Stone in Chicago and other Eastern cities.

For further information apply to N. P. PERINE, 638 Market street. [19v24-3m

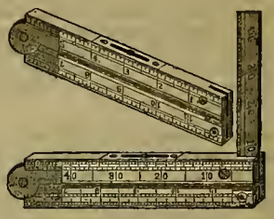
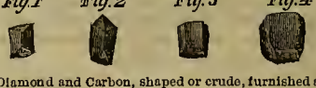
NELSON & DOBLE,
AGENTS FOR
Thomas Firth & Sons' Cast Steel.

MANUFACTURERS OF
Sledges, Hammers, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools.

18 and 15 Fremont street, near Market, San Francisco.
10v14qr

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address STEPHENS & CO.,
18v24-3m Riverton, Conn.

DICKINSON'S
Patent Shaped Diamond Carbon-Points.
Fig. 1 *Fig. 2* *Fig. 3* *Fig. 4*


Diamond and Carbon, shaped or crude, furnished and set for Dressing Mill-Burrs, Emery-Wheels, Grindstones, Conglomerate, Drilling Rock, Sawing or Working Stone, Truing up Hardened Steel, and for other mechanical purposes. Also Glaziers' Diamonds. See Scientific American, July 24th, Nov. 20th and 27th, 1869; Engineering and Mining Journal, Jan. 17th, 1871; Journal of the Franklin Institute, Philadelphia, June, 1870. PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Endino May 21st, 1872.

Process for Preserving Iron.—William H. Sterling, New York, N. Y.

Apparatus for Lighting Gas by Electrical Sparks.—John Vansant, San Francisco. Cal.

Tunneling Machine.—Allexey W. Von Schmidt, San Francisco, Cal.

For the Week Ending May 28th, 1872.

Manufacture of Ice and Refrigerating Machines.—Samuel B. Martin and John M. Beath, San Francisco, Cal.

Hose-Cart.—William E. Shaw and Charles A. Ashley, Stockton, Cal.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Stave Working Machine.—Lamartine R. Fulda, San Francisco, Cal. This is a machine for working or manufacturiug cask, tank, and barrel staves, and completes them ready for use, from the rough bolts of lumber. It consists in the use of a movable carriage provided with clamps for holding the rough bolt of wood. This carriage being made to pass the shaping saw guided by an adjustable curved gauge so that the proper shape shall be given to the stave. The stave is then laid upon an adjustable table, and made to pass a cutter, which gives the proper bevel to the edges. From there it is placed on another curved table and passed under a cutter which does the crozing, forming the grooves for the head. The first meutioned carriage has also a device for getting the center line transversely to the staves for the pnrpose of setting up correctly.

Grape Crusher and Stemmer.—Geo. Johnston, Sacramento, and Wm. A. Johnston, of Folsom, Cal. This improvement relates to that class of grape stemmers and crushers in which a series of heaters are revolved inside of a box or case, the lower portion of which is formed of parallel slabs. In this class of machines, as ordinarily made, the grapes are crushed in separate charges, and the stems thrown out of the caso after the grapes are crushed, by opening one side of the case so as to permit the revolving arms to hurl them out. This improvement consists in a peculiar construction of the case and revolving beaters, by which the grapes can be continuously fed into the machine at one end, while the stems are automatically discharged from it at the other end.

Clothes Dryer.—Anson C. Stowe, San José, Cal. This is an improvement in extension racks for drying clothes, which are hung upon a wall, and are so constructed as to permit of their being partially closed so as to throw the main portion out from the wall. It consists in the employment of ropes or cords for supporting the parts of the frame in the cramped position when they are being used, and connecting these cords by means of rods, which also serve to hang small clothes upon.

Clasp for Side Arms.—F. A. Will aud Julius Finck, San Francisco, Cal. This is an improved clasp such as is used in attaching or suspending the scabbard or holsters of side arms from the belt or waistband of the person carrying them. By means of this device the attachment can be quickly made and the scabbard or holster is not liable to become unfastened or lost.

Tool-Holder.—F. A. Will, and Julius Finck, San Francisco, Cal. This invention is an improved handle or holder for small tools, such as are used by dentists, etc. This handle is capable of serving for any number of small tools, such as excavators, burr-holders, and like instruments. This and the foregoiug invention, are iu the line of the practical work of the inventors, Messrs. Will & Finck, and seem to be decided improvements.

Hydraulic Nozzle.—R. R. and Joseph Craig, Nevada City, Cal. This is an improvement in hydraulic nozzles which has for its object prevention of the stream from bursting or assuming a rotary motion as is the case in ordinary nozzles. This is accomplished by constructing the nozzle, or one portion of it, with three sides or of a triangular section so that the body of water will be carried through it in a direct line, the angles and peculiar form of the nozzle preventing the stream from twisting.

The Text of Interesting Decisions in Patent Cases.

COMMISSIONER'S DECISIONS.

GEORGE W. MORSE—Extension.—In the matter of the Application of George W. Morse for the extension of his patent, No. 20,214, granted May 11, 1858, for an Improvement in Cartridge-Cases. Decided May 11, 1872.

Loyalty or Disloyalty of an Applicant during the late War as Affecting the Question of want of due Diligence in Producing an Invention—Want of Diligence—Novelty.

It is a settled rule that loyalty or disloyalty during the late war does not affect the status of an applicant in the Patent Office, except as it may pertain to the matter of "due diligence." The Office can make no discrimination hetween parties in the Union and Confederate services, respectively.

As hetween two cartridge cases—hoth of which are gas-tight, central fire, capable of heing recharged and recapped, and made of substantially the same parts—it does not constitute a patentable difference to place on the outside of the shell the sliding cup which was formerly on the inside of the shell.

Leggett, Commissioner.

W. T. MUNGER vs. J. P. CONNELL.—Appeal from the Examiners-in-Chief.— Invention, Improvement in Door-Bells. Decided May 14, 1872.

Diligence in Reducing an Invention to Practice.

An inventor is not required, in order to preserve his rights, to devote all his energies to the development of his invention to the exclusion of all other matters. The law only demands of him reasonable diligence.

Where an inventor, who has embodied his invention in a model which he deemed too rude in workmanship to he sent to the Patent Office, delayed his application for the twofold purpose of completing a hetter model and of hearing from a pending application upon a kindred invention, and at the end of two months and a half was prostrated hy discase, and during his illness another originated the same invention and obtained a patent: *Held*, that the first party was not fairly chargeable with lack of reasonable diligence in perfecting and adaptiug his invention. Duncan, Acting Commissioner.

DECISIONS OF THE COURT.

Supreme Court of the United States.

ALBERT L. MOWRY vs. ASA WHITNEY.—In Equity—Appeal from the Circuit Court of the United States for the Southern District of Ohio. Decision rendered April 22, 1872.

Construction of Whitney's Patent for Car-Wheels—Specification—Damages for Infringement, how Estimated—Rule as to Interest upon Liquidated Damages.

An infringer of a patented process is to account for the additional advantage derived therefrom heyond what he would have had without it; and he is not liahle to the extent of his entire profits in the manufacture.

In estimating an infringer's profits the question to he determined is what advantage has he derived from nsiug the patented process over what he had in using other processes then open to the public, and adequate to enahle him to ohtein an equally heneficial resnlt.

The profits recoverahle against an infringer are really damages, and unliquidated until the decree is made; and upon unliquidated damages interest generally is not allowed.

Where the defendant's infringement was not wanton, hnt consisted in the use of a process secured to him hy a patent: Held, that while this did not protect him against responsibility for damages, it ought to relieve him from liability for interest on profits.

Reform in English Patent Laws.—The "Committee of London Patent Agents" are still active in endeavoring to hring about some much needed reforms in the English patent laws, and we hope they will meet with ultimate success—indeed as light is being thrown on the subject, we do not see how they can fail. Patentees, engineers, manufactnrers, and others, are invited to forward suggestions for the improvement of the patent laws to 8, Southampton Buildings, London. George Haseltine, Chairman of the Committee.

Sowing and Harvesting in June.—While the gathering and threshing of wheat is now briskly going on in the valleys and plains of many parts of California—the tule lands are yet being sown with the same kinds of grain. Oats and barley will continue to he put in still later on the reclaimed tule lands; and corn, for green corn or roasting ears, as late as the first of August.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Florence S. M. Co.—June 7. Location: Ely District, Lincoln county, Nev. Capital stock, $3,000,000, in 30,000 shares. Trustees—Joseph Clark, A. E. Head, Ernst Huhn, M. C. Hillyer and D. B. Hunt.

Beach & Paxton G. and S. M. Co.—June 6. Location: Virginia M. District, Nevada. Capital stock, $2,000,000, in 20,000 shares. Trustees—Wm. Bnrling, S. P. Middleton, James L. King, John Landers and A. C. Deitz.

San Francisco Abend Post Co.—June 6: The object of the company is the transactiou of a printing and puhlishing husiness. Capital stock, $25,000. Trustees—W. F. R. Schindler, Hugo Herzer, Lonis George Koehler, Stephen Ruf and D. Klintworth.

California G. and S. M. Co.—June 11: Location: Owyhee county, Idaho Territority. Capital stock, $435,000, in 21,750 shares. Trnstees—D. Edgerton, James Graham, W. H. Townsend, O. R. Johnston and R. S. Miles.

Gray Eagle S. M. Co.—June 12. Location: State of Nevada. Capital stock, $3,000,000. Trustees—Robert Sherwood, Joseph Klopenstine, Isaac Lohman, Ralph H. Rogers and C. F. Hamilton.

Meetings and Elections.

The Trustees of the Crown Point Mining Company were elected June 3d as follows: J. D. Fry (President) B. Peart, Wm. Kohl, R. H. Sherwood and J. A. Pritchard. J. P. Jones was elected Superiutendent, C. E. Elliot. Secretary, and A. Hayward Treasurer.

The Yule Gravel Co. held their annual meeting May 30th. The election of officers resulted as follows: L. S. Cutter (President) W. H. Sears, Henry Baker, Benjamine Dore (Treasurer) aud A. J. Bryant. W. H. Watson was elected Secretary and John Yule, Superintendent.

The annual meeting of the Mechanics Institute was held on the 3d inst., and the following Trustees elected: A. S. Hallidie, H. L. Davis, George Spaulding, Asa R. Wells, R. B. Woodward, A. S. Iredale and S. H. Wheeler.

At a meeting of the stockholders of the Union Pacific Silk Manufacturing Co. on the 30th ult. James L. Blaikie was elected Presidcnt, Geo. C. Bode, Vice-President, W. C. Ralston, Treasurer, J. D. Stewart, Secretary, and Joseph Warhurton, Snperintendent.

The Wellington Mining and Smelting Company have elected the following Trustees: G. W. Beaver (President), Richard Chenery, C. W. Kellogg, G. W. Prescott, and J. E. de la Montagnie. R. Wegener was continued as Secretary; W. C. Ralston, Treasurer, and G. W. Terrell, Superintendent.

The Mammoth Mining Company met on the 3d inst. and elected the following Trustees: S. Linkton, Rohert Sherwood, J. P. Jones, R. R. Gihens, F. G. Berry, C. W. Fox and J. H. Crocker.

The Minnesota G. & S. M. Co. elected the following Trustees, on the 3d inst.: William M. Lent, Geo. D. Roherts, J. W. Gashwiler, Geo. Hearst and G. W. Grayson.

The Highland S. M. Co. elected trustees for the eusuing year on the 4th inst., as follows: Henry Williams, (President,) Thomas Bell, S. W. Lee, Alfred Mallet and John W. Shaw. David Wilder was continued as Secretary.

The Mount Jefferson Milling and Mining Co. elected the following Trustees, on the 4th inst.: S. D. Boswell, (President,) Roht. Sherwood, D. D. Shattuck, C. Deane and E. B. Pond. J. W. Clark was retained as Secretary.

The Alaska Consolidated Mining Co., elected the following Trustees on the 8th, inst: J. H. H. Williams, H. P. Wakclee, H. C. Kibbe, H. T. Wheeler, and C. Deane.

The Maxim Gas Company have elected the following Trustees: W. H. Ladd, James, H. Deering, Fred. Openheim, James H. Clark, and Jacob Bacon, (President). J. Openheim was elected Treasurer, and Robert Day Secretary.

The Front Street, Mission and Ocean Railroad (or Sutter Street line) Company, held their annual meeting on the 10th, inst. The following Directors were elected for the ensuing year. H. H. Haight, Milton S. Latham, Geo. C. Bode, H. Caseholt, Wm. Blackwood, A. Dohle, and T. H. King.

At the first annual meeting of the Schell Creek Mining Company, held Juue 11th, the following gentlemen were elected Trustees, to serve for the ensuing year: F. Vassault, W. T. O'Neil, E. J. Moore, H. Dutton, Benj. Dore.

Increase of Capital Stock.

The Senator Mining Company met on May 31st, and resolved to increase their capital stock from $600,000 in 6,000 of the par valne of $100, to $2,400,000 in 24,000 of $100 each.

The Hale & Norcross Company held a special meeting on the 30th ult. and increased their capital stock from $3,200,000, in 16,000 shares of $200 each, to $9,600,000 in 48,000 shares of the value of $200. This is the second time within two months that this company have increased their stock, the original amount being $1,600,000, in 8,000 shares of $200 each. There are 400 feet in the mine.

The Green G. & S. M. Co., of Gold Hill, held a special meeting on the 3d inst. and increased their capital stock from $600,000 in 24,000 shares of $250 each to $2,400,000 in 24,000 of $100 each.

The Golden Age and Empire G. & S. M. Co. have increased their capital stock from $650,000 in 2,600 shares of $250 each, to $2,600,000 in 26,000 shares of $100 each.

The Imperial S. M. Co. met on the 3d inst. and increased their stock from $2,000,000 in 4,000 shares of $500 each, $10,000,000 in 100,000 of $100 each. The claim amounts to 184 feet of ground.

The Alamo G. & S. M. Co. met on the 4th inst and increased their capital stock from $300,000 in 3,000 shares of $100 each to $30,000,000 in 30,000 shares of $100 each.

The Confidence Silver Mining Co. held a meeting on the 4th inst. and increased their capital stock from $780,000 in 1,560 shares of $500 each, to $2,960,000 in 24,960 shares of $100 each. There are 130 feet in the mine.

The Empire Mill and Mining Co. at a meeting held Jnne 10, increased their capital stock from $1,000,000, in 1,200 shares, to $5,000,000, in 50,000 shares.

The North Bloomfield Gravel Mining Company filed a certificate of the increase of its capital stock on the 12th inst. The stock of the company is now $5,000,000, in 50,000 shares.

Wool Product of the World.

In the following table will he found a near approximate estimate of the numher of pounds of wool annually produced in the different countries of the world, from the most reliable information ohtainable:

	POUNDS OF WOOL.
Asia, including Russia in Asia	320,000,000
Great Britain and Ireland	260 000,000
Germany, Netherlands and Belgium	198,000,000
United States	130,000,000
Australia	130,000,000
France	125,000,000
European Russia	125.000,000
South America	110,000,000
Asiatic Turkey	100,000,000
Spain	62,000,000
Persia	50,000,000
North Africa	50,000,000
European Turkey	42,000,000
Italy	40,000,000
Cape of Good Hope	20,000,000
Portugal	17,000,000
Canada	12,000,000
Sweden and Norway	11,000,090
Greece	8,000,000
Denmark	3,800,000
Switzerland	3,000,000
New Mexico	500,000
Total	1,818,300,000

There are other countries that produce considerahle quantities of wool, hut as they export little or none, it is not brought into the account. We present the grand aggregate of the world's annual clip, more for the pnrpose of showing how entirely insignificant is the quantity produced by any one State of the Union, towards affecting very materially the prices of wool under any circumstances.

The eight to ten million pounds of California wool, the aggregate clip of the present year, though of large importance to our producers, is but a small part of the world's wool that finds its way into the markets of manufacturing countries. Hence we should never put so much stress upon its importance as to helieve its presence or not in those markets, will work any material changes in its value.

Wool is an article that keeps, and when prices rule low, producers who are not obliged to realize hold hack, and the aggregate of these, when brought out hy hetter prices, has always proved to he very large. Hence the difficulty of maintaining panic prices for any great length of time. Onr wool producers and speculators have this year learned the truth of this statement, which will douhtless he heeded in coming years.

Mining Sales.—The Humbug and New York Tunnel, near Jamestown, has heen sold to a San Francisco Company for $16,000.

A one-third interest in the Holcomh, Berry & Co.'s claim at Pilgrim Bar, Montana, has been sold to Wm. Roe for $6,000.

Philadelphia Agency.—W. H. Daffin, formerly of San Francisco, is our correspondent and business agent, Frankford, Philadelphia, Pa.

H. Barlen & Bro., formerly of Havilah, Kern county, will please communicate with this office.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin): in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale hy Dewey & Co., Patent Agents and Publishers Scientific Press, S. F.

State University.—The next term of the Preparatory Department will hegin April 20th, 1872.

The course of study embraces the Ancient and the Modern Languages and the higher Mathematics, and is specially adapted to the University curriculum.

Terms, $12 a term. GEORGE TAIT, Oakland.

VALUABLE PATENTS
For Sale.

The following, and other valuable patents and pateuled articles are for sale:
The Hamilton Road Scraper.
A New Roller Skate.
A Drinking Fountain for Fowls.
Dr. Beer's Improvement in Dental plates.
Shears for Cutting Grapes and Flowers.
Aikin's Furnace for Roasting Ores.
A New Sash Tightener.
Dewey's Lightning Can Opener.
The Dewey Toy Engines.
A Bed Spring that has no equal.
Kennedy's Screw Propeller.
Gustafson's Tree Box.
A Machine for Packing Flour.
Nevin's Sand Cap for Hubs.
Westfall's Potato Digger.
A New Collar Stud and Neck Tie Holder.
A Combination Household Tool.
Bouney's Grain Lifter.
A New Wire and Picket Fence.
Self-Acting Churn Power.
A machine to Roast Nuts.
A Gas Generator.
An Improvement on Thill Attachments.
A Superior Cider and Wine Press.

We invite parties who feel interested in any of the above named patents to call and examine samples or send for description WIESTER & CO.,

PURCHASERS please say advertised in SCIENTIFIC PRESS.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Corchur & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR ON DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. ☞ THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,
Agents for Pacific States, San Francisco.

☞ At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF-OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

GAS LIGHT FOR EVERYBODY!

Coil Oil Lamps Changed to Gas Lamps at a Trifling Cost, by merely Changing the Burner and Using Different Oil.

This valuable little invention can be attached to any coal oil lamp by any one in half a minute. It makes its own gas just as fast as it is required, and when the light is blown out, the gas ceases to be generated.
NO CHIMNEY IS REQUIRED.
The flame is as white as city gas, and produces no smell or smoke.
One Burner is equal to Six Candles, and COSTS ONLY ONE CENT PER HOUR.
This burner uses Petroleum Fluid, Danforth's Oil, Gasoline or Taylor's Safety Fluid. One burner sent to any address, postage free, on receipt of 50 cents currency or stamps. WIESTER & CO.,

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of April, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, on the 19th day of June, 1872, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. J. W. CLARK, Secretary.
Office, 418 California street, San Francisco, Cal. m25

Woodland Gold Mining Company—Location of works, West Point Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of May, 1872, an assessment of 12½ cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 64, Merchants' Exchange, California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 25th day of June, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 16th day of July, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. F. MADGE, Secretary.
Office, No. 64 Merchants' Exchange, California street, San Francisco, California. may25-td

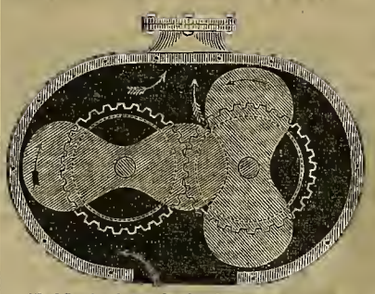
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

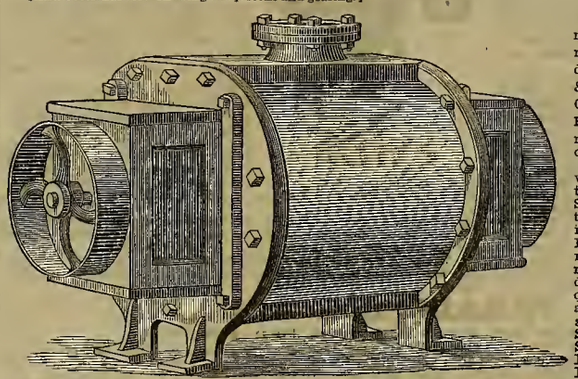
Stockton, Cal.



[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

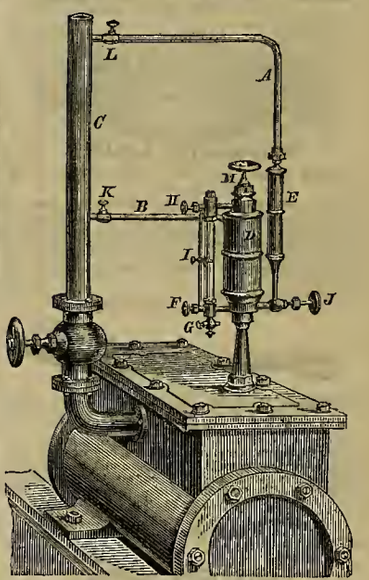
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

The Hesse Grinder and Amalgamator.

BEST IN USE!

Especially well adapted for the Reduction of Sulphuret Ores.

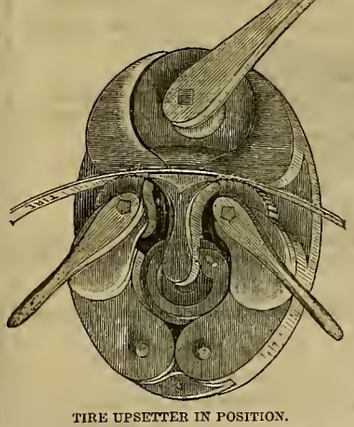
Wheelwrights and Blacksmiths, Attention!



TIRE UPSETTER IN POSITION.

TIRE UPSETTER!

The Only Successful One Yet.

HUGHES' PATENT.

We call attention to the following Certificates from parties who have used our Machines, and CHALLENGE COMPARISON, side by side, with any other Upsetter, EITHER FOR LIGHT OR HEAVY WORK.

Extracts from Testimonials.

We have had a Hughes Improved Tire Upsetter in use for about three years, and in all that time have found it a most valuable Machine for the purposes for which it was intended. It is strong, not liable to get out of repair, upsets the tire well without making any hulge to be hammered out, and without disfiguring the tire in any way. It is quickly adjusted to any size of tire, and entirely does away with any necessity for cutting and welding. * * We give it a hearty recommendation to others in the Wagon and Wheelwright, or Blacksmith business, and feel that we cannot speak too warmly in its favor. It is a first-rate success.

Yours, very truly,
SAUL & CO.,
Nos. 7 and 9 Powell street, San Francisco.

Stockton, March 16, 1872.—This is to certify that we have used the Hughes Tire Upsetting Machine for three years, and can recommend it as a first-rate Machine for fitting heavy Tires.
WM. P. MILLER.

We also refer to John Dupuy, 528 Broadway st., S. F.; Bernhard Gallagher, 222 Mission st., S. F.; Kimball & Co., cor. Fourth and Bryant sts., S. F.; Larkin & Co., 631 Howard st., S. F.; T. D. Lamer, N. E. cor. Seventeenth and Valencia sts., S. F., Cunningham & Parker, 634, 636 and 638 Howard st., S. F.

With this Machine two men can upset the heaviest Tire in a few seconds after the Tire is heated. The strength of a child is enough to operate it. There are no nuts, bolts, or screws about it to break.

PRICE $50 GOLD COIN, delivered in San Francisco, ready for use or transportation. If the Machine is found not to do its work well, we will refund the price.

No. 338 Montgomory st., San Francisco, Cal.

The Pacific Rural Press.

THE PACIFIC RURAL PRESS is now in its third volume. Its columns contain a large amount of original information upon the different branches of husbandry on this coast. Its great variety of contents is properly systemized for the convenience of the reader, and ably prepared in pleasing language and style. Each number contains something of rare interest to every member of the household.

The state of this new field of agriculture, so different from all others; the new and improved methods of farming necessary here; and the absence of any published record of farming and rural experience on this coast, form a combination of circumstances which render a really good journal of greater importance to farmers here than are similar issues to farmers in any other part of the world.

The PACIFIC RURAL PRESS has been heartily received and well patronized, and its liberal success enables us to improve and enrich its columns from month to month.

Its reading and advertising matter is entirely chaste. All farmers should subscribe without delay. Every honsehold should enjoy its richly filled pages.

Subscription, in advance, $4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts. Address

IMPORTANT MINING BOOK.

Mines, Mills, and Furnaces of the Pacific States and Tcrritories; An Account of the Condition, Rcsonrces, and Methods of the Mining and Metallurgical Industry in those Regions, Chiefly Relating to the Precious Metals. By Rossiter W. Raymond, Ph. D., Vice-President Am. Inst. of Mining Engineers; Editor "Engineering and Mining Journal." Author of "Mines of the West," "American Mines and Mining," etc. J. B. Ford & Co., 1 vol. 8vo. 458 pp. Ex-Cloth. Sold by DEWEY & Co., publishers Scientific Press, San Francisco, at publishers' rates, $3.50.

This volume will scarcely need to be recommended to those who are acquainted with the "Mines of the West," "American Mines and Mining," and other professional publications of its author. The present work is in no sense a repetition of Mr. Raymond's former ones. It contains a full and comprehensive account of the condition of the gold and silver mining industry of the United States, with practical recommendations of great importance to those engaged in it. The chapter on the treatment of auriferous ores in Colorado is the best account of the stamp-mill process ever published in this country; and the general discussion of smelting processes for silver ores supplies an instant want. The series of volumes, of which this forms the third, which bave proceeded from the rapid but careful pen of Commissioner Raymond, are recognized in this country and in Europe as professionally authoritative and popularly interesting to a remarkable degree. To be technically accurate, but not technically abstruse, is their salient and acknowledged merit.

A Valuab'e and Attractive Patent for Sale.

Unna's New Patent Magnetic Building Blocks for Children.

It is a toy that both pleases and instructs. The philosophical principles it illustrates give it a living interest, which delights both old and young. They are made as cheap as wooden blocks, are more attractive, will not break, but will last indefinitely.

Magnetism holds the blocks togcther, and enablee children to easily build them into forms in which they will hold themselves. For the same reason of adhesiveness, the blocks can be made in eimple and easy forms. The Patent was allowed April 30, 1872, and will soon issue. Rights for territory or for manufacturing for sale. Address soon,

JACOB UNNA,
Office of the Scientific Press, San Francisco, Cal.

The Dewey Toy Engine—Patent Secured.

NOVELTY COMBINED WITH AMUSEMENT AND INSTRUCTION. Most Ingenious Toy of the Nineteenth Century. A Genuine Steam Working Engine, a Model of its Style, Complete and Perfect in all its Parts. Adapted to the wants of the Student, School-Room, and Parlor. This is not a humbug, but is a genuine Steam Engine, with Boiler, Cylinder, Piston, Fly-wheel, Safety and Throttle Valve, and a Grooved Pulley for imparting motion to other Toys. This Engine is designed for something more than temporary amusement, as it will afford the means of amusement for the old as well as the young, and prove to be a source of pleasure and profit to all. EXPLOSION IMPOSSIBLE, if Directions are followed. Send for descriptive circular. WIESTER & CO.,

VOLUME XXIV. Number 25.

The Flying Fish.

There are several varieties of the flying fish; all similar in appearance to the one herewith illustrated. They are all characterized by an excessive development of the pectorals, which assume the form of wings, and are used as such. Their length and power is sufficient to enable the possessors to support themselves in the air for a moment only. Fishes of this family are found in all warm and temperate seas. They are all small, varying in length from four to about twelve inches.

An Unexpected Disappointment.

At the last meeting of the California Academy of Sciences, the proceedings of which will be found in another column, the President as Chairman of the Joint Committeee of the Chamber of Commerce and California Academy of Sciences, announced that the American Association for the Advncement of Science, who had intended to meet in San Francisco, in August, had notified the Committee of a change in their arrangements, and that they would meet at Dubuque, Iowa, instead of in this city. All the correspondence in relation to the matter was read, and as some misunderstanding may exist as to the reasons for the change, we append the report of the above mentioned committee who had charge of the preparations, since it explains the whole affair.

SAN FRANCISCO, June 13th, 1872.

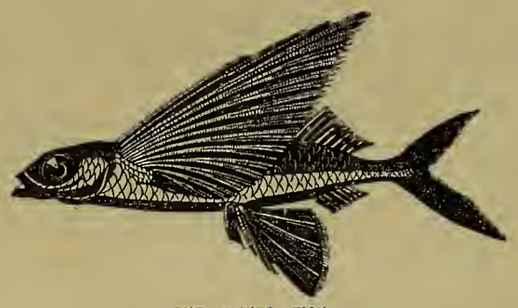
At a meeting of the Committees of the Chamber of Commerce and the California Academy of Sciences, held this afternoon—present Messrs. Eldridge, Wise, J. Henston and Davidson, the latter acting as Secretary, Professor Davidson reported that since the last meeting of the committees he had received a telegram from Professor Lovering, permanent Secretary of the American Association for the Advancement of Science, stating that the Association would meet in Dubuque, Iowa. The committee desire briefly to state a history of the correspondence with the American Association.

One year since the California Academy of Sciences ascertained from some of our prominent citizens that they could raise sufficient funds by subcription to entertain the members of the American Association and their expected European guests, and asked the President of the Chamber of Commerce to join in the invitation. This was acceeded to, and the invitation extended in July, 1871. At the last August meeting of the Association in Indianapolis, the invitation was accepted, provided the railroad fares could be secured at sufficienly low rates. The President of the Central Pacific Railroad had already procured to the Academy of Sciences reduced rates for their guests on the Central Pacific and Union Pacific railroads, with the assurance that he would do better. In the East, the President of the American Association undertook the whole arrangement of the matter of fares over all lines, and having succeeded to his satisfaction, announced that the next annual meeting would be held in San Francisco, in August. Subsequently under date of May 17th, the permanent Secretary of the Association stated to us in writing, that the terms of the fare were much less favorable than they had supposed, and asked if the scientific men and citizens of San Francisco desired the meeting here. We responded by letter of June 3d, that we meant all we expressed in the invitation, and continued it, promising all the assistance and courtesies usually extended on similar occasions; that we had already secured the use of halls, etc., but if they would not come now, we would renew the invitation at another time. On the 8th inst, a telegram was received asking whether the Association was expected to meet in San Francisco, and an answer telegraphed that we had written for their decision. On the 12th inst, the permanent Secretary of the Association telegraphed that our letter was received and the Association would meet at Dubuque, Iowa. We have acknowledged the telegram, expressing our regrets.

This letter was signed by Prof. Davidson, Chairman of the Joint Committee of the Chamber of Commerce and the California Academy of Sciences.

Low Heat Evaporators.

In all large sugar-making or sugar-refining establishments, one of the most important appliances that make up the grand total of their machinery, is the vacuum pan. All manner of saccharine juices as they are obtained from cane, beet, maple or sorghum are, or can be, easily evaporated without danger of injury from burning, to the consistency of heavy syrup, by almost any of the various open air evaporations now in use, under the ordinary pressure of the atmosphere. But when it becomes necessary to further concentrate the syrup to the point of crystallization and conversion into sugar, there is great danger of burning the same on account of its greatly increased density.



THE FLYING FISH.

It is when in this condition, that the utility of the vacuum pan is brought prominently out; for by its use, instead of requiring a heat of 212° Fah. and over to produce ebullition and evaporation, by exhausting the air from the pan the syrup is concentrated by a rapid evaporation of the water it contains at a heat ranging from 150° to 180° Fah. which precludes the possibility of injuring the syrup by burning.

The objection to the vacuum pan for common use among farmers who would otherwise make their own sugar in many more instances than now, is its great cost, ranging from $2,500 to $8,000, depending upon size, and whether made of copper or iron.

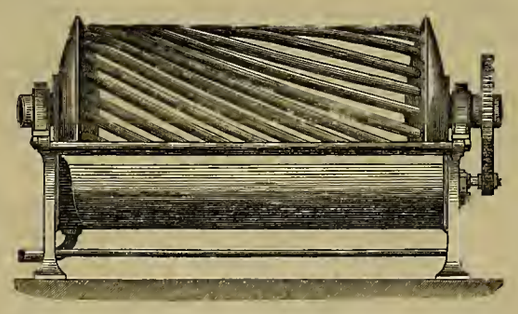
To supply the want so seriously felt, a great many attempts have been made to construct apparatus that would concentrate syrupe under the ordinary pressure of the atmosphere. The result has been, a number of contrivances more or less well adapted to the purpose.

One of the very best of these is figured in our illustration, and consists of an iron or copper pan in the form of a half of a hollow cylinder, in which is placed an open ribbed cylinder composed of a hollow disk at each end, connected by a number of copper tubes, two inches in diameter; these are brazed at each end perfectly tight.

The hollow disks and the pipes connecting them are heated by steam, usually the exhaust steam of an engine, or the heated air and gases from the furnace before passing into the chimney. Either of these is made to pass through the disk and tubes, entering at one end of the shaft which is hollow, and passing out at the other.

The juice or syrup being placed in the pan, and the cylinder made to revolve, a rapid evaporation ensues at a temperature quite below 212° or the boiling point of water. The same apparatus is equally applicable to the concentration of saline waters, or those containing any of the mineral salts.

From the principles upon which this method of concentration is based, it is evident that its successful working will depend upon the degree of dryness of the atmosphere and upon the rapidity with which the air passes over the surface of the syrup. The apparatus should therefore always, when it is practicable, be placed at the windward side of the house; at all events it should be beyond the influence of the vapors which arise from other evaporating vessels.



LOW HEAT EVAPORATOR.

In this pan it will be observed in the illustration that the pipes are curved into a spiral instead of being straight, this curvature avoiding the beating action in entering the syrup, which causes frothing, affords greater facility for the removal of the condensed water, and enables a greater quantity of heating surface to be got within a given space.

We might mention other arrangements of low temperature pans, but all are constructed upon the same principles and we believe that none are superior to the one we have described.

It can be used with great economy where the atmosphere is dry and has a brisk motion.

An Invention Wanted.

The "Committee on Railroad Improvements" write to the Boston *Daily Advertiser*, offering to pay the sum of $10,000 to any one who shall within two years from January 1st, 1873, invent a system of signals which shall supplant the use of steam whistles on railroads and which shall be pronounced by competent judges to be free from the evils of the present system, attended with no discomfort to passengers on the trains, or the highways, or to residents along the line of the railroads. The idea of doing away with steam-whistles on railroads may seem somewhat preposterous to many, but the committee bring many objections against its use, stating that thousands of persons, sick and well, are disturbed by it day and night, etc. They think that some substitute for it may be found suitable not only for locomotives but for manufacturing establishments, steamboats, etc., and with this view offer the above reward through the columns of the *Advertiser*. One fifth of the amount thus pledged shall be paid to the author of the improved invention at any time within the period specified whenever its claims shall have been substantiated by the appointed judges and the balance whenever the invention shall be adopted and used by a majority of the railroad companies in New England, provided such adoption be previous to January 1st, 1877. The letter says the judges shall be:" the chairman of the Masachusetts Board of Railway Commissioners: the President of the Boston and Albany and Boston and Marine railroad companies: the Professor of Civil Engineering in the Massachusetts Institute of Technology, and the chief locomotive engineer on the Boston and Albany railroad. If any of these gentlemen decline serving, the donors reserve the right of appointing substitutes.

At present railway whistles are a necessity for calling the attention of switchmen or when approaching stations or crossings, etc., and it would be unsafe to rely entirely upon a bell, since it can not be heard for any great distance. It can not be done away with unless some suitable substitute is at hand, and this reward is offered to stimulate the inventive faculty of the people in that direction. We hope that some of our California inventors will turn their attention to the matter and try their chances in securing the reward.

Japanese Advancement.

The Japanese Government has recently shown a laudable disposition to encourage and develo in their own country the improvements of modern civilization, and to this end it has within the past few years imported from the United States and various parts of Europe, skilled workmen n almost every branch of industry. It seems that among other valuable lessons gathered by their liberal policy of sending out Ambassadors to the various civilized countries of the world in order to learn the most practicable plan for the encouragement of home industries, they have learned that the best way to encourage improvements and consequently advancements in the various branches of science and art, it ie necessary to have a law protecting and rewarding inventors.

To this end we see that a patent law has recently been enacted which will not only protect their home inventions, but induce foreign inventors to bring their new ideas to the Japanese country. Many of our American patentees could secure a patent in Japan, with great profit to themselves, and we do not doubt but that it will in the course of a few years be one of the best fields for the successful inventor. Now that the doors have just been opened we expect to do a lively business in Japanese patents, as the chances are that the first patents introduced into that country will be the most profitable.

CORRESPONDENCE.

Mines of Humboldt County, Nevada.

[Written for the SCIENTIFIC PRESS.]

Wrecks Everywhere—Renewing the Struggle.

In no part of Nevada, perhaps, has the business of mining experienced such vicissitudes as here in the Humboldt country, passing during its brief period that has elapsed since its inauguration twelve years ago, from the most active and hopeful to the most abject condition; which point it reached some seven or eight years ago. Remaining at this low ebb for several years, things took a turn, and have since been slowly but steadily mending. First and last, there have been put up within the limits of this county not less than eighteen or twenty mills, of one kind and another. Of this number six or seven have been destroyed or removed elsewhere; about an equal number ie standing idle and the balance are now ruuning, with one, the Genaca, at Winnemucca, nearly ready for operations. This is a poor record of Humboldt milliug and miuiug industry, though not worse than that of such minor callings as happened meantime to engage a portion of her population. Every class and pursuit suffered alike; her towns as well as her mills have gone to decay or been swept wholly out of existence; go where you will and you see deserted villages and cabins, as well as dilapidated mills and half completed shafts and tunnele, all telling of the blight and decay that fell with such terrible effect upou this unfortunate section of country.

In passing, however, through the principal mining districts here, one sees now many signs of returning vitality and hears again the note of preparation to renew the struggle, so long since nearly suspended. Here and there small parties are at work, some getting out such small quantities of high grade ore as can be most easily reached, and a few engaged in work looking to a thorough opening up of their claims, a number of which have already been developed into productive and valuable mines or are rapidly being brought to that condition. In this category we have, near here, the Arizona and Sheba, with the Lang Syne and Tallulah, over in Dun Glen, and the Winnemucca Chief, and the Pride of the Mountain, lying uear the railroad in the Wiunemucca range of mountains. On the Arizona a large force of men are at present employed, the quantity of ore daily extracted amounting to sixty or seveuty tons. From the Henning, eituate near the Arizona, and from the Peru one mile south of the town, considerable quantities of high grade ore are being constantly takeu, both mines beiug in the moautime thoroughly explored. The Sheba, at Star City, is yielding its usual complement of shipping ores, the value of which ranges from three to eight hundred dollars per ton.

On the West Side of the Humboldt Range

There is more animation than iu this immediate neighborhood. The new mill at Ryo Patch, and tho smelting works at Oreana are at work, and, accordiug to report, doing well. Arrangements have also been mado for starting up the mill on the Humboldt Slough, which for a long time has been etanding idle. From the Alpha, Starlight, and other mines on that slope of the range we have cheerful reports, and there is little doubt but the balance, which has hitherto beon on the debit, will before the year ends he ehifted to the credit side of the ledger with the most of these companies.

From Battle Mountain, Golconda, Dun Glen, Central and Sierra Districts

Equally encouraging accounts come to hand, there being more men now at work in these several localities than for seven or eight years before; and there is no queetion but they will turn out this season twice the amount of bullion ever sent from there any preceding year; and this with very little increaee of milling capacity, or aid from capitalists abroad. Neither has there been much addition to the population of these districts of late, the results having been mostly achieved by the old residents who have stuck by the country through its long season of decadence and inaction.

Winnemucca District

Having enjoyed the advantage of liheral pecuniary assistance, lately supplied hy San Francisco capitalists, ie now in a fair way to advauce rapidly, and it is generally thought will soou eclipse every other section of Humholdt county. The mines there, or at least a portion of them, are in themseves very fine. The Winnemucca Chief and the Pride of the Mountain have always enjoyed a high local reputation and even attained some distinction abroad. From the first they have taken precedence of all other claims in the district, and always been recognized hy mining experts as standard properties. Having recently passed into the hands of moneyed men, these miues are to he thoroughly exploited; prelimiuary labors looking to that end having already been entered upon.

Having passed through them a few days since I was surprised, not more at the amount of exploratory work done, than to see such remarkable bodies of ore as have here heen developed in their lower levels. In the Pride of the Mountain the lode at a depth of 200 feet stands full 30 inches hetween its walls, every pound of the veinmatter being high grade milling ore. The same lode, carryiug its full strength, passes into the Winnemucca Chief, which, though less opened up, showe the same evidences of large and permanent wealth. The work heretofore done on these mines was mostly carried on iu an irregular and desultory way. Since changing owuership they are to be opeued up with system and energy, a large workiug shaft being now in course of excavation on each. As soon as these are sunk to the proper depth the business of raising ore will be commeuced, which will be in the course of the next 30 days, by which time the new mill, now being orected uear hy to run on these ores, will ho complcted aud ready for operations. This ore it is expected will mill, taken *en masse*, at the rate of $100 per ton, about a thousand tons of it already disposed of having averaged over $200 por ton. I consider those two of the most valuable mines in this part of the State; the manner in which they are held aud the fine administration under which they have heen placed, adding greatly to their intrinsic merit. Refore the seasou is ended they will increase in a marked manner.

The Bullion Product of Humboldt County.

Which competent authorities set down at $200,000 for the current year, of this sum the Arizona and Sheba mines alone will turu out nearly one-half, and there is no question but the balauce of the county will make up the other, and perhape do a great deal more.

HENRY DEGROOT.

Unionville, Humboldt Co., Nev., June 8th, 1872.

[Written for the PRESS.]

Mismanagement in Milling.

That many Eastern and English capitalists are shy of investing in our mines, is by no means surprising, wheu the manner in which numbers of these are managed is considered.

Some weeks ago a trenchant article by a practical millman and chemist, appeared in the *Inyo Independent* on the absurdity of superiutendents and others undertaking to conduct a business of which they were wholly ignorant. In fact, it would appear that sometimes a decided preference is given to men of little, or no knowledge of the reduction of oros. The notion seems to have obtained in somo quartors, that any fool can run a mill, and that a superintendent's position is an excelleut method of providing for some relative, or impecuuious friend, whose brains have hitherto been insufficient wherewith to earn his salt at anything else.

It is not strange that in a mill under such amanagement that most of the preoious metals obtained is extracted from the pockets of the shareholders, and not from the ore which may be worked, or rathor which they have vainly attemped to work. Nevertholess, such men frequently hold their posts for a considerable time, for the most of them have a *Cacoethes loquendi* (freely translated by Mr. Sam Weller iuto "the gift of gab—wery galloping," which enables them to talk directors into the belief that no one else could have done better than they.

The writer has met a London stock broker, and a New York bootmaker, afterwards an insolvent grocer, each placed in the responsible position of superintendent, when neither of them had ever seen a mill, or reduction works before his appointment. Men of this stamp, as the assay proves the value of the ore, blame the machinery, the management of which they do not understand, or which their own stupidity has imperfectly arranged, for the uusatisfactory results which they ohtain. Such men are alike prejudicial to the mine, to the engineer who constructs, or to the inventor who may perfect any valuahle improvements.

Numerous instances might be mentioned whieh would prove this, but one may snffice. There is a mill, not a hundred miles from Monitor, Alpine County, which has probahly cost from 70 to 100 thousand dollars in construction. A revolving furnace has recently been erected there and put in operation. The patentee guaranteed it to roast and chloridize a ton of crushed ore per hour, and during three days that he was there it performed the duty required of it, the furnace being properly fed and attended to by himself. A eample of the chloridized ore he gave to the assistant superintendent and a similar sample he had assayed for his own satisfaction, and it proved that 78⅓ per cent. of the eilver was chloridized, As it was a low grade ore, this is better than the operation of any other furnace. Now comes the assietant superintendent into court and says:—

"We cauuot get over 50 per cent. of the guaranteed results." Very probably not, ths only wonder is that they got so much, but having got it, they naturally want to get more and the patentee is written to, to know if he can "*remedy*" matters. The remedy lies in their owu hands. They have not worked the furnace properly. It appears that in the plentitude of their wisdom *they failed to supply salt to their ore* wherewith to obtain the chloridizing element—and likewise cut off the water from the cooler by which the fine and the richer particles, which might otherwise escape, are precipitated, and saved. What other neglect in feeding, or in permitting frequent stoppages, etc., they may have been guilty of—or what new theories their muddled brains may have developed it is hard to say; but the simple advice that should be givon to them is to have qualified practical men, not tyros to manage the reductiou works, see that everything is in proper order, and that every employee attends faithfully to the details committod to his charge, and they will fiud that tho revolving furnace, will work as perfectly with them, as it has done with others, aud will fully establish the undouhted merits and euperiority of the invention.

METALLURGIST.

A Surface View.

We yestorday took a stroll aloug the liue of the Comstock so far as that great lead is enveloped within the limits of Virginia. Where we fouud tho foreman at the works, we obtained all the information in regard to their respective mines that we asked, and where we did not we merely looked about, as the workmen do not much like being questioned about the affairs of the mine in which they are working; besides, we we did uot eet out with the intention of prying into the underground mysteries of any mine. We first visited the

Gould and Curry.

We found the brick walls of the additiou latoly erected for the receptiou of their large, new hoisting engine up, but the roof has uot yet been put on, nor is any of the wood work completed. This delay is occasioned, we believe, by the difficulty experienced in getting timber. The new engine is in place and ready to run as soon as the building shall have been completed. Meantime they are hoisting from the incline to the perpendicular shaft hy hand. In the hoisting compartments of the shaft they run douhle or two-story cages. The pump was not going at the time of our visit, the wrist-piu having broken—a break which would be very soou mended. We arrived at

The Savage

At the time they were changing the ten-hour shifts (1 o'clock), and remained to see the men brought up and sent down. The men who are on ten-hour shifts are those who work in the npper levels and dry and comfortable parts of the mine, whilo those who have oight-hour shifts are thoso who work down about the 1,500-foot level, where it poure water from every seam in the rock, and where it is hot as —well never mind. Both classes receive the same wages, but those who have hard places have ehorter hours as a compensation. There are at present over 300 men at work in the Savage, 50 of whom are up at the old mine. Counting the wages of these men at $4 per day, it amounts to $1,200, or the snug snm of $8,400 per week; hut many of them, as engineers and others, get $5 and $6 per day. By figuring up the wages item for a month, and then for a year, some slight idea will be ohtained of what it costs to run a mine. As we said above, we remained awhile to see them.

Hoisting the Men.

At the Savage the cages nsed are larger than in most of our minee, as their shaft is a very large one, and in a single car they are ahle to hoist 2,200 pounds of ore, about as much as they can hoist in two cars on their double cages, and can also hoist as many men; for twelve men can safely stand on the platform of one cage. The men take their places in three rows, four in a row, packed like sardines in a box, the signal is given and down they drop. Observing the exact manner in which the meu were packed upon the cage, we asked the foreman what he would do in case he had a few miners of the size of Beany Irwin, K. B. Brown or Billy Shephard. He smiled and said: "That would rather spoil the arrangement." An official, who fills the same place that is filled by a conductor on a traiu of cars goes up and down with the men when shifts are being changed. This is the station tender. It is his duty to ring the signal bells when the cage is to stop or start. The foreman explained to us that, but for this, there would be always be some heedless fellow taking it upon himself to ring signals, and death and destruction would he the result. "All business," said he, "is conducted as strictly as on board of a man-of-war." A lantern is hung in the top of the cage when men are being lowered and hoisted. The reason for this, the foreman said was that in case of any accident the men would not hecomo frightened—an accident in the dark always demoralized tho men, and made matters ten times worse than they would otherwise have been. Their pump was not running at the time of our visit. They only run six hours out of the tweuty-four. They have four lifts, and have some wa-er to pump from the bottom of tho incline, most of which is from leakage above, however.

The Hale and Norcross

Afforded ue but few items. There are abcut 150 men at work at the mine at present, as they have been discharging a great many of late. They are not trouhled with water, and pump only occasionally. We observed here the curious fact that, instead of there being hot air or steam arising from the mouth of the shaft, there is a strong downward draught. This is accounted for by the fact that the Savage shaft is considerably higher than the Norcross, and there being a connection hetween the two, the draught is naturally through the former. This is good for the Norcross folks, but bad for the Savageites, though not so bad as it would be without the circulation of air meutioned.

The Chollar

Folks are having a good time just now at cleaning out oue of the compartmeuts of their shaft, which was filled iu with waste at the time their former hoisting works were destroyed by fire. This is at a depth of 500 feet below the surface, and the waste dirt extends down about 200 feet to where there is a platform. A platform was put in and this dirt thrown down to save the shaft, as there is for a certain space, a epecies of clay liable to swell and crush in the timbers. This waste now comes out in the shape of slum, and as thcy cannot load a car in this blackened compartment, they send the cage down the adjoining compartment, cut holes through the partition and let the slum run out into the car. It is a very nasty job, but one necessary to be done. We observed nothing else worthy of note, and asked no questions in regard to the lower regions, further than to learn that all was goiug on about as usual.

The Ophir

Is pumpiug, hoisting and drifting as usual. There ie but little water, and nothing to prevent the vigorous prosecution of work in all parts of the mine. They are well supplied with wood aud stores of all kinds. We saw nothing further worthy of mentiou, and will here conclude our survey.—*Virginia Enterprise*, June 7.

STEAMSHIP BUSINESS AT PANAMA.—Six regular steamship lines from Europe and the Uuited States run vessels to Aspinwall every month, while fourteen steamships ruu every month to Panama on the Pacific sids, exclusive of the casual and coastwiss trade.

SCIENTIFIC PROGRESS.

Effects of Electricity on Milk, Etc.

The *Milk Journal* states that, in an address before the North Western Dairyman's Association, Mr. X. A. Willard stated the following interesting facts:

Mr. Andrew Cross, the celebrated English experimenter, considered that the roots and leaves of plants were in opposite states of electricity; some of his experiments in this direction are very interesting. He cut two branches from a rose tree. They were as nearly alike as possible with the same number of buds, and both equally blown. An arrangement was made by which a negative current of electricity was passed through one, a positive current through the other. In a few hours the negative rose drooped and died, but the positive continued its freshness for nearly a fortnight; the rose itself became full blown and the buds expanded, and survived an unusual length of time. Again, he was able to keep milk sweet for three weeks in the hottest weather of summer, by the application of a current of positive electricity.

On one occasion, he kept fishes under the electric action for three months, and at the end of that time they were sent to a friend, whose domestic knew nothing of the experiment. Before the cook dressed them, her master asked her whether she thought they were fresh, as he had some doubts. She replied, that she was sure they were fresh, indeed, she said, she would swear they were alive yesterday. When served at table, they appeared like ordinary fish, but when the family attempted to eat them, they were found to be perfectly tasteless; the electrical action had taken away all the essential oil, leaving the fish unfit for food.

However, the process is exceedingly useful for keeping fish, meats, etc., fresh and good for ten days or a fortnight. Now this is consistent with our observations and the facts known to every one in the habit of handling milk. When the condition of the atmosphere is in a negative electrical state, or shows a deficiency of positive electricity a state of weather which we designate as sultry, close, muggy, and the like, there is always difficulty in keeping milk sound. Even in good, healthy milk, the fungus germs common to all milk increase and multiply with great rapidity, producing the common lactic acid fermentation or souring of the fluid; but in case fungi from decomposing animal or vegetable matter comes in contact with the milk, rapid decomposition takes place, and we have rotten milk, putrid odors, and floating curds. The exposing of such curds to the atmosphere, as well as the aeration of milk to improve its condition, are both philosophical, because these minute organisms of fungi are affected by the oxygen of the air, which checks their development and multiplication.

The influence of electrical action is a question entirely new to the dairy public, but is one concerning which I think some useful suggestions present themselves for our consideration. When the electrical equilibrium is disturbed, or when the state of the atmosphere indicates a preponderance of negative electricity, we are all made aware of the fact by its depressing influences. At such times it is important that we take more than ordinary care in the handling of milk; that it be kept out of harmful odors; that attention be given to its aeration, and such treatment be given it as shall be inimical to the growth and development of the fungi. And again, the fact that milk may be kept sweet a long time in hot weather by electrical action will offer a very important suggestion to inventors in the preservation of milk, and perhaps to the improvement of cheese at the factories. I believe that we are only on the threshold of the cheese making art, and that as we become better acquainted with the laws of Nature and their application, great progress is yet to be made in every branch of dairy husbandry.

Combustibility of Iron.

Prof. Magnus of Berlin, with a view to determining the combustibility of iron, has devised for that purpose a magnet, to which iron filings readily attach themselves like a beard, all radiating from the poles in such a manner as to leave small interstices. On igniting these with an alcohol lamp, or gas burner, they continue to burn most brilliantly; and if the experimenter stands on some elevation, like a step ladder, and wave the magnet, a most magnificent rain of fire is produced. When this experiment was first performed in Berlin, it was received with applause by the king and court of Prussia.

It is well known to physicists that a magnet of some strength may be made by placing a bar of iron or steel in the magnetic meridian, and striking it a few sharp blows with a hammer. If no magnet can be procured for the experiment, a bunch of cotton wool is saturated with alcohol, placed on some support, and the alcohol ignited.

Some fine iron filings, placed on a sheet of paper, are allowed to fall in a fine stream on the burning mass, when they burn with brilliant scintillations, showing that iron is combustible, if only the supply of air is sufficient.

Still more remarkable is the experiment showing that iron is more combustible than gunpowder. A mixture of fine iron filings and coarse gunpowder is thrown on a small quantity of burning alcohol. As the iron falls through the flame, it takes fire and burns with its characteristic color and scintillations. The gunpowder falls through the flame without taking fire, and lies quietly in the bottom of the saucer until the alcohol is nearly consumed, and the flame is brought into contact with it, when it flashes, showing that it was the powder, not the iron, that passed through the flame without taking fire.

The influences which the minute size of the particles, by which a large surface is exposed to the air, has on the combustibility of a substance is well illustrated in pyromorphic iron. If the oxide of iron be reduced, by passing over it a current of hydrogen, the heat employed being less than that of boiling mercury, the metallic iron is left in such a fine state of subdivision as to take fire spontaneously when allowed to fall through the air.

Light and Radiant Heat.

In a recent lecture on the "Identity of Light and Radiant Heat," Professor Tyndall said that heat is sometimes associated with ordinary matter, through which it creeps by the process of conduction; at other times it is not associated with matter but flies through space from the sun, entangled with beams of light, with great velocity, and is then called "radiant heat." When the combined solar beam falls on bodies, heat is developed only as light is absorbed, and the amount of the former is an exact equivalent for the amount of the latter. A red ribbon held in the red part of the spectrum appears of a brilliant red color; when held in the yellow, green, blue, or violet bands it looks black. A green ribbon looks green in the green portion, but black in all other parts of the spectrum. The red ribbon is not heated by the red rays, nor is the green one by the green rays; but when placed where they look black they are warmed by the rays falling on them, because they absorb these rays and wherever there is absorption there is increase of temperature. Black absorbs all rays, or because all rays are absorbed the substance is black; and if a black ribbon be carried from the blue end of the spectrum toward the red, it would grow warmer as it advanced, and become warmest of all quite beyond the red, where nothing is to be seen by the eye. Past the portion of the spectrum competent to excite vision, rays exist which, measured by the force they are capable of exerting, are a thousand times more powerful than the luminous ones, as indicated by the movements of the needle of a galvanometer when all visible rays are cut off.

Radiant heat is reflected from plane surfaces, just like light; also from curved mirrors, by which it may be brought to a focus. It behaves like light also with lenses. Moreover, a ray of heat may be divided, as a ray of light, into two—the ordinary and extraordinary rays, by means of a crystal of Iceland spar.

Waves of radiant heat vibrate transversely, polarization having no meaning with respect to longitudinal vibrations.

The lecturer concluded that the thing called radiant heat was part and parcel of the radiations from luminous bodies. At the other end of the spectrum, beyond the violet rays, there were some feeble rays of radiant heat; but in the short range of the visible spectrum lay all that wealth of color which is the chief source of beauty in nature and in art. If he were to be asked how the light came to be thus composed, and how it is that external nature so sifts this light as to give to the flowers of the field and the leaves of the forest trees their wealth of beauty, and how it comes to pass that we have a sense of the beautiful which has grown up in the midst of these agencies, and how it is that man derives perfection and elevation of mind from the contemplation of this beauty, he would answer that the cause must be left for philosophers to discover. He thought that, if successful at all, they would be able to give only an approximate solution, and that the real root of the matter would forever lie beyond them.—*The Week.*

The Agassiz Expedition.

Few scientific investigations of late years have attracted so much interest, as the one in which professor Agassiz is now engaged. Though there is perhaps little or nothing of pecuniary value expected to come out of the explorations in progress by this party, the sum of human knowledge will no doubt be largely increased by the facts which they will bring out from districts and depths, which have heretofore been enveloped in profound obscurity.

One of the questions which will be studied, will be the depth to which light penetrates the ocean. It has heretofore been held that the extent of penetration was very limited, and that the greater depths were in absolute darkness. Professor Agassiz believes differently, and will pursue the study with apparatus of the party's own invention.

The latest news from the expedition is under date of March 18th, from off Sandy Point, Patagonia.

Agassiz's glacial theory has already received final verification by the realization of his prediction, that in the Southern hemisphere there would be found traces of a glacial movement northward from the South Pole. He found near Mount Aymond erratic boulders polished, scratched, and grooved, all tending to prove the passage of a sheet of ice in a northward direction over this portion of the country. An important discovery was also made by Count Pourtales that many of the Patagonian mountains are extinct volcanoes, it having been hitherto claimed that none existed in the South American continent except on the line of the Andes.

Among the curiosities of science noted are immense quantities of kelp, or *macrocystis pyrifera*, the largest known algæ, which grows about those coasts in from six to twenty fathoms of water in vast beds which warn the mariner to avoid the dangerous neighborhood. Its stems grow to be of immense length, having been estimated at from seven hundred to one thousand feet, thus probably constituting the most elongated of all organized beings, and dwarfing in comparison the redwood of California or the eucalyptus of Australia. One day in the open sea they passed patches of floating sea-weed with large sea lions lying on them, apparently navigating in that manner with much satisfaction.

The Professor expects to reach San Francisco in time to attend the National Convention of Scientists which meets in this city in August next, to which body he will make an official report of what he has seen and learned on the trip.

SENSATION IN PLANTS.—M. Figuer believes that a plant has the sensation of pleasure and of pain. Cold, for instance, he says, affects it painfully. We see it contract, or, so to speak, shiver under a sudden or violent depression of temperature. An abnormal elevation of temperature evidently causes it to suffer, for in many vegetables, when the heat is excessive, the leaves droop on the stalk, fold themselves together and wither; when the cool of evening comes, the leaves straighten, and the plant resumes a serene and undisturbed appearance. Drought causes evident suffering to plants, for when they are watered after a prolonged drought they show signs of satisfaction.

The sensitive plant, touched by the finger, or only visited by a current of unwelcome air, folds its petals and contracts itself. The botanist Desfontaines saw one which he was conveying in a carriage fold its leaves while the vehicle was in motion and expand them when it stopped—a proof that it was the motion that disturbed it.

Sensation in plants is of the same kind as in animals, since electricity kills and crushes them as it does animals. Plants may be also put to sleep by washing them in opium dissolved in water, and hydrocyanic acid destroys their vitality as quickly as it does that of animals.

MECHANICAL PROGRESS.

Faults in the Plans of Dwellings.

How frequently it happens that in the most elegant houses there is often to be met, somewhere, a want of comfort or accommodation! The hall is either too wide or too narrow; the stairs communicate to close to the hall door, or have the leading flight too long, making the ascent tiresome. This latter is a serious fault, and yet one that is too general. The parlors, which are always laid out with great attention to effective appearance, are seldom really comfortable. There is no room for furniture unless the cabinet maker manufactures articles to fit the spaces left to his care. Many a sofa or piano has to intrude on a window—nay sometimes to block a doorway—while spacious openings are left for sliding doors, in order to give an appearance of extent by throwing the front and rear parlors into one.

The invasion on the space properly intended for furniture has become so "fashionable" of late days, that it has compelled the introduction of many little trifling articles which rather tend to take from the dignity of the chief rooms of a pretentious dwelling, and make of it a mere "baby-house," but like everything that custom has inured us to we derive pleasure from these miniature comforts, just as we become satisfied with the nutshell stateroom on a steamship to which we are confined.

But it is in the plan of the chamber story that the most uncomfortable arrangements are to be found. As for instance, their is either no space for the proper location of a bed, or it must be so placed as to subject the occupant to a strong draft of air and its unfortunate consequences. The toilet table, the bureau, the mirror are all or some one of them without a fit location. The windows are all injudiciously placed, or the chimney so inconvenient as to be worse than useless. The door opens awkwardly from the placing of a chair or table behind it, or perhaps when open it exposes the room unpleasantly. Wardrobes are either wanting, or if present, are away from the window, so as to be dark and otherwise inconvenient.

These are but a few of the serious faults of our modern dwellings—faults which might have been avoided if the necessary room for furniture had been taken into consideration during the composition of the plan, and if the artistic effect strained at in the exterior had not been permitted to crowd out the comforts of the interior. He is a sensible man, indeed, who weighs well the wants of his household, and lets external display occupy a secondary place in his plannings. The comfort of his inner home is more valuable and more lasting to him than the passing praise which an architecturesque appearance might call forth from the outer world.

How few there are who build understandingly! The architect produces his design, and it is canvassed as to its merits and demerits, but always with a view to "appearances." "This will be a fine room, pleasing in all respects," is a common remark, but the necessities which we have mentioned convince the proprietor that he overlooked the points that go to make it comfortable, and he and his household now unite in blaming the architect for want of forethought in the erection of so pretty yet so very uncomfortable a house.

Doors should always slide. This mode is far superior to hanging on hinges, as the opening of a sliding door does not interfere with the regulation of furniture in an apartment, and the sliding is so simple, and easily acted on, that it presents great advantages over the old fashioned door, which it will doubtless yet supersede. At present it costs more than hanging, but if it became general, the sliding mode would be cheaper down to a figure that would bring it within the reach of all. A partition wall need never be over six inches thick to give room for sliding doors. In fact, in small houses, a four inch partition may be made available for this purpose by using inch plank, in four inch breadths, for the inclosing of the door.

Sliding doors for wardrobes and closets would often prove more desirable; they do not impede the light as hinges often do. Above all things attention should be given to the accommodation of bedsteads, chambers, and at the same time secure a fitting place for the toilet. Light and ventilation are great objects in sleeping rooms, for on these depend the health of the occupant.

As regards the ventilation of a house, the object is more easily accomplished by means of a cupola over the stair chamber. All the rooms can be ventilated by this means in the coldest days in winter or during the prevalence of a storm without opening a window to admit air. The heat of the basement furnace under the hall, where it should be placed, would aid in the complete ventilation of the house in winter. A fan, worked by a small caloric engine in an air chamber under the hall, would effect thorough ventilation in the summer season.

Attention to these and a hundred other things which go to make a comfortable house should be the aim of him who would be successful; and of all things, he should never fetter his architect's efforts with considerations of external display at the expense of internal convenience, comfort and happiness.—*Pittsburgh Register.*

[Translated for the PRESS.]

Important Advance in Paper-Making.

The *Arbeitgeber* describes under this heading, an invention of a German chemist, Ungerer, in manufacturing paper from wood. In changing the wood into its fibres in a mechanical way, much power is demanded; and, moreover, the material must also be ground up, whereby it loses much in durability. Hence, for a number of years repeated attempts have been made to effect this in a chemical way by many persons, notably, Adamson, Keegan, Deminger, Broad, Sinclair, and Tessié du Mothay. Only the two last have met with practical success. The method of Sinclair has been introduced in several places, and produces a better and cheaper material than before obtainable, a little cheaper than Mothay's.

All these processes demand the use of very high pressures—up to 14 atmospheres—with the action of strong soda solution. The weak points are the high pressure and the necessity that the material must still be ground, and therefore injured more or less. But Ungerer seems to have overcome both difficulties. He uses a pressure of only 5 to 6 atmospheres, one-half the amount of soda, and only one-fifth the amount of chlorine. The following table gives a comparative view of both methods for producing 1,000 kilogrammes of dried bleached material:

UNGERER.		SINCLAIR.	
2,250 kilo.	wood.	2,250 kilo.	wood.
212 "	soda.	562 "	soda.
128 "	chemicals.	750 "	coal.
900 "	coal.	250 "	chlorido of lime.
50 "	chloride of lime.		

There seems to be some mistake in regard to the respective amounts of coal. Sinclair using only 750 kilo. for his much greater steam pressure; while Ungerer uses 900.

The importance of these inventions is easily understood from the statement that the cost of producing the wood material is reduced nearly one-third by the methods of Sinclair and Tessié du Mothay, and fully one-half by that of Ungerer. This has such an effect, that Belgian factories are able to depress considerable the prices on the Rhine, notwithstanding the import duty of 2 florins. A large company has been formed in Vienna, to introduce the process of Tessié du Mothay; another for Ungerer's method; and a third for a third patent.

The claims of superiority over other methods (especially those of Sinclair, du Mothay, etc.) made by Ungerer, are:—1. Simplicity and cheapness of method; 2. Less steam pressure; 3. Less soda and chloride of lime; 4. Nearly complete regaining of the soda (98 per cent. against 70); 5. Economy in power, there being no grinding; 6. Greater strength of manufactured material.

FIREPROOF BUILDINGS.—If you *will* have wood floors and stairs, lay a flooring of the thickest sheet iron over the joists, and your wood upon that and sheath your stairs with the same material. A floor will not burn without a supply of air under it. Throw a dry board upon a flat pavement, and kindle it as it lies if you can. Prevent drafts, and, though there will be fires, no houses will be consumed.

STAINING HORN.—Horn may be stained by being immersed in a solution of nitrate of silver, and then exposing it to sunlight. Or it may be steeped in a hot dilute solution of bicromate of potash, and then in a decoction of logwood.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

BULLION.—Monitor *Miner*, June 8: Bullion to the value of $2,200 was shipped from the Tarshish mill this week.

WET CRUSHING.—Alpine *Chronicle*, June 8: The Schensctady Mill is being put in order for crushing.

AMADOR COUNTY.

STATE OF MAINE.—Amador *Ledger*, June 15: The Co. will have their water-power mill completed and in rsadinsss for reducing ore about the 1st of July.

ROBBERY.—On Saturday night last, the sluice hoxs on the claim of Baptiesto & Co., near Volcano, were cleaned up and about $1,500 taken.

PLYMOUTH.—Rich rock has lately heen struck at a depth of 300 ft. in the Alpine.

SUTTER CREEK.—Cor. same: Work at the Summit mine is progressing with vigor.

CALAVERAS COUNTY.

WEET POINT.—Calavsras *Chronicle*, June 15: Fresh developments are heing constantly made, and work is progressing with unabated vigor.

At the Zacatara work is being pressed on the 170-ft. level with extremely favorahle results. The rock taken out is very rich and the lead is showing finely.

In the Bartolo the rock being taken from the bottom of the shaft will average $100 psr ton. At 125 ft. the ledge varies from 2 to 3 ft. in width, all the rock showing free gold.

In the Harris, near the Bartolo, 30 tons of rock, lately crushed, paid $60 per ton. The shaft is 80 ft. deep.

The Steger is lying idle on account of water.

Work is steadily progressing on the Woodland and Ohio Cons.

CAPITOL.—San Andreas *Citizen*, June 15: This claim is down about 50 ft., with a 4-ft. vein steadily improving.

BY TELEGRAPH.—Los Angeles, Jnne 13: Six hnndred hars of hase bullion have been recsived from Csrro Gudo for shipment to S. F.

LONG TOM.—Bakersfield *Californian*, June 6: In Long Tom No. 2 a rich snd extensive body of quartz has been developed which promises to be as valuahle a production as the old mine.

NEVADA COUNTY.

NORTH STAR.—G. V. *Union*, June 9: The mine is pumpsd out and will be ready for the undergronnd workmen to-morrow.

GREENHORN.—We saw yesterday a fine spscimen of ore which has just been taken from the mine. The rock coming out snd put through the mill will give the June yield at douhle that of May.

SHAMROCK.—The shaft is down 60 ft. and the ledge in the bottom is about eight inches thick. There are hetween 15 and 20 tons of quartz on the dump and a crushing will soon be had.

RICH CLAIMS.—Nevada *Transcript*, June 13: The old Teeple claims at Omega, are paying splendidly. The Co. made a partial clean up, a few days ago, of $40,000. It is expected their total receipts for the season will not vary much from $100,000.

GRANITEVILLE.—The Erie Co. are sinking the main shaft 100 ft. deeper, when another level will be opened. The Ansho ledge is about half a mile from the Erie. They are running a tunnel of 100 ft. which will cut the ledge at a depth of 100 ft. The Black & Young mine is paying splendidly.

THE Russel Ravine ledge, at Rocky Glen, is owned by a Virginia Co. who have struck a rich and well defined ledge. It is their design to put up machinery on it in a ehort time. It is reported that the Sweet mine, at the South Fork, is sold to S. F. capitaliets, who propose to erect hoisting works and a mill on it immediately. The Union rock looks fair and has paid $10 per ton. The Iowa, in the same locality, is a large and good looking ledge.

THE Birchville Co. ie einking a fine shaft and are down about 250 ft.

RELIEF HILL.—The Esgle gravel claims in 5 days run paid $4,600. The Specie claims yielded $4,000 at their last clean up. At Woolsey's Flat the Boston Co. cleaned up in 4½ daye working, $7,100, and this only from the upper boxes, leaving quite a number as yet untouched.

THE Oriental Co. cleaned up ahout $3.000 the other day after ahout a week's rnn.

There is another Co. known as the Blue Bank, which is paying well.

THE owners are running a tunnel into these claims. It will be 600 ft. long when completed.

AT Moore's Flat there are 3 Co's. washing, viz: The Illinois, Eagle and Woe Ting. The Eagle Co. cleaned up about $4,400 in a short run. The Illinois Co., who are only stripping, took out $5,000 in a very short time, while the expenses were hnt small. The Co. expects to clean up over $15,000.

PLUMAS COUNTY.

RICH STRIKE.—Quincy *National*, June 8: Another rich pay chimney has been struck in the Baker ledge, Cherokee, in the 180-ft. level, running south from the new incline. The rock prospects from $50 to $60 per ton. The mill is running day and night, on rock paying from 6 to $8 per ton, and crushes from 20 to 24 tons psr day.

SAWPIT & VICINITY.—The Last Chance Co., helow Sawpit, will make big money this year. Dorsey & Co., on South Fork, have been making good wages all winter. and the claim is still paying well. Mickel & Bros. will have an engine at work on their claims on South Fork, during the coming summer, and their prospects are good for plenty of ore.

HUDSON.—The rock from the shaft and drifts is literally "lousy" with gold, and several specimens prospected from $40 to $75 per ton, The shaft is to be sunk 40 or 50 ft. deeper.

SAN DIECO COUNTY.

ITEMS.—San Diego *Union*, June 6: The Antelope mill, at Banner, is running ore from its mine. Work is being prosscuted on the Goldsn Chariot, Ready Rslief, Kentuck, Madden, Atlantic Cahle, and Chapparal mines. The Chapparal and Madden will have some ore crushed at the Antelope mill ere long. The Ready Relief is looking hetter.

At Juliau, Defree's mill is running steadily on Owens ore. Pierce's mill is crushing rock from the Hayden ledge. The Stonewall is pushing the construction of the new works, but is steadily running at the old site until the new srrangements shall be completed. The following leads are heing worked at Julian: The old George Washington has been oommenced again. The Eagle mine is developing under Capt. Gale; regular operations are going forward on the Owens, Van Wert, Hayden, San Diego and Helvetia mines.

SISKIYOU COUNTY.

Yreka *Union*, June 8: ROBBED.—The sluices in the claim of White & Co., on French Flat, Humbug, were robbed on Friday, May 31st, of hetween $200 and $400. The same night also, the sluices of Osterman & Co., near Hawkinsville, were rohhed.

TUOLUMNE COUNTY.

Sonora *Independent*, June 15: WIDENING.—At the 15 ft.-level, in the Ham & Sloan lead, American Camp District, the vein has widened to the thickness of 7 or 8 inches. Amount of a pan of decomposed material, they get $7 in pure gold.

OPHIR QUARTZ MINE.—The vein, at 200 feet below the surface, is 2 ft. in width, and from an assay just made out of average rock, prospects over $600 to the ton.

Nevada.

ELKO COUNTY.

Elko *Independent*, June 8: NEW DISTRICT.—A new district has been discovered ahout 20 miles south of Toano, and named the "Silver Zone." The ore found, assays well up in the thousands, and the prospects are good for a good camp.

COPE DIST.—Work on the Excelsior, is being pushed with flattering prospsct. It is supposed that the hullion yield from Cope District, for 1872, will equal that of the two previous years.

EUREKA DISTRICT.

Eureka *Sentinel*, June 11th: RICH ORE.—The body of ore recently developed in the Adams-Hill mine, assays from $400 to $800 per ton. The grand average of the entire deposit, will not fall below $600 per ton.

COY HILL.—The Wild Rover is showing an excellent body of ore. Already 30 or 40 tons of ore are on the dump, and will very eoon he worked. Average rock from this mine assays from $100 to $250 per ton.

THE Benito, just ahove, shows a good body of ore.

THE Grand Deposit, Douglas, and Vulcan mines, all show good signs of extra milling ore in large quantities, as do the Selden and Dick mines.

THE new furnace will be running hy July 4th.

ELY DISTRICT.

Ely *Record*, June 9: BULLION.—W. F. & Co. shipped during the past week, bullion valued at $139,184.01, an excess of $38,120.17 over that of the previous week.

CUSTOM MILL.—A Cnstom Mill is soon to be erected here. It will start up with 10 stamps, but will he built of a capacity for 20. A furnace will also he attached to the mill. The total cost is estimated at $50,000.

PIOCHE.—Bullion shipped since the 22d ult. The average pulp assay of the ore, is $249 per ton. The main shaft is down 400 ft., and will again cut the ledge at the depth of 620 ft. At pressnt drifting toward the ledge on lower level. Expect to strike the ledge in about 45 ft. more in the cross-cut on the 460-foot drift. Most of the ore raised at prssent comes from fourth station, and is from the same body as they expect to strike in the lower level. The fourth station drift is improving rapidly, and the chances for striking a large body of ore at this point are favorable. Expsct to commence crushing ore at the Bowery mill to-day, and will then have two mills (25 stamps) running on ore from this mine.

NEWTON BOOTH.—Sinking on the shaft is going ahead with good progress.

PACIFIC TUNNEL.—At present looking extremely well in the face, as honeycomb rock is coming in and indications are favorable.

HUHN & HUNT.—Drifting into the hill for prospecting purposes. Cut into a small ledge, ahout 6 inches in width, in the drift last week, assays from which showed $365 per ton.

CHIEF OF THE HILL.—Running drift west on lower level, in which the ledge continues to improve and widen. Still working on the raises for air, which is now good, except in the lower winze.

NEWARK.—Still sinking the winze on the lower level.

TWO BROTHTRS.—The 2 ore seams, have come together, and show 8 inches in width in the ledge. The shaft is down 150 ft.

SETTING SUN.—The shaft is down 65 ft., and sinking has been suspendsd. The drift is looking well, and shows good ore in the face.

SPRING MOUNTAIN TUNNEL.—Drifting on second ledge cut in tunnel, and in on it 25 ft., with lsdge showing 3 ft. wide in face. Ore shows in bunches throughout ledge, hut has not yet come in solidly.

CANDOR.—Mine looking well in hoth shafts, and constantly improving.

CHAPMAN.—Commenced opening the 300-ft. level on Friday last.

GREY EAGLE.—The shaft down 30 ft, and shows 2 ft, of ore in the hottom.

LODI TUNNEL.—Is in 80 ft., and pushing ahead with good progress.

VICTOR.—This location, west of the Setting Sun, and east of the Silvor Peak started up work again Saturday.

DESDEMONA.—Still running drift west from Fuller shaft, and have it in over 100 ft., with ore showing well iu face.

MEADOW VALLEY.—The rumor in regard to the strike in the 300 ft. level in No. 3 shaft, we havs beea unable to traoe to reliable authority. Shipping the nsual quantity of ore to mill.

STIRLING.—Good progress is heing made, and ore shows well in the ledge as sinking progresses.

AMELIA.—Still sinking the shaft, which is down 65 ft., with the ledge showing 3½ ft. in the hottom.

HUMBOLDT.

BULLION.—Unionville *Silver State*, Jnns 15: The shipments for 2 week amounts to $14,251, from the Arizona miue.

EAGLE.—An incline of 130 ft. has been run, and a shaft of 70 ft. snnk on the ledge averaging 5 ft. in width. There are 500 tons of ore on the dump that will work $100 per ton.

CLEAN UP.—The Pioneer mill, after a rnn of 9 days, on tailings, with only 2 pans, cleaned up 56 tbs. of bullion, .991 fine.

GOV. BRADLEY.—The shaft on the ledge is 35 ft. deep. The vein is from 5 to 6 ft. wide, and asssys from $105 to $2,767 per ton in silver.

NEW FURNACE.—A new Stetefeldt furnace is soon to he erected in connection with the Pioneer mill.

ADAMS MINE.—The ledge is very regular, and the ore carries from $50 to $500 per ton in silver, with a small percentage of base metal.

FINE MINE.—Ruse & Co. in Central Dist., are taking out and shipping some exceedingly rich ore. The last shipped, went something over $200 to the ton.

REESE RIVER.

BULLION.—Reese River *Reveille* June 8: W. F. & Co., shipped during May, 94 hars weighing 8,732 pounds of the value of $104,000.49.

BELMONT.—The Canfield mine of the Belmont Co. has its new hoisting works running and is raising fine ore. They are also sinking the main incline.

The Monitor Co. ie taking out lots of rich ore and opening the chute from the main to the upper level.

The El Dorado South Co.'s lower north level is in 140 ft., the south 100 ft. The main incline is down 400 ft. A large quantity of fine ore has been extracted.

In the Arizona a levsl is heing run north from the main tunnel in a large vein of ore; there is also a lower level being run north and one south to strike the main chimney.

The Combination Co.'s hoisting works are running and taking out fins Stetefeldtite ore.

There are ahout 200 miners workiug in the camp.

WASHOE.

LOCAL SUMMARY.—BELCHER.—Gold Hill *News*, June 15: Daily yield 275 tons, from 1,100 and 1,000 ft. levels. The main incline measures 407 ft. below the 850 ft. level. The drift west at the 1,100 to meet this incline is in 90 ft. and has 90 ft. farther to go hut progress in drift and incline is necessarily slow, owing to the very hot air and lack of ventilatiou. No work is being done at the 1,200 ft. level. When the incline reaches the 1,100 ft. levsl it will be 140 ft. west of the ledge, in the hard west country rock. At the 1,000 ft. level in the incline, a station is opened and drifting east to the ledge is heing done. When the proper point is reached, drifting north from it will he done in order to meet the drift south being driven at the 1,000 ft. level. This drift is in splendid ore, some of it exceedingly rich. It assays $16,000 to the ton. The last shipment of bullion averaged nearly 70 per cent. gold. The following is the yield for May: Nuniher of tons, 7,411; yield per ton, $57.93; per cent worked 76; total yield, $429, 339.35.

OVERMAN.—Sinking the shaft deeper for a new level was commmenced last Sunday. The drift at the 1,000 ft. level toward the ledge is in 248 ft. and in more favorable indications than ever. The ground works well and the chances for developing a good body of ore are excellent.

CONS. VIRGINIA.—The drift south on the 500 ft. level is continued through a strong vein of quartz of a very favorable appearance. The east cross-cut at this level is iu 80 ft. from the main south drift, 46 ft. of which are in fine looking quartz, with spots of ore. The drift from the Gould & Curry is within 50 ft. of the southern boundary of the mine. This drift is progressing at the rats of 4 ft. per day. The vein will be tapped hy this tunnel at a perpsndicnlar depth of 1,100 ft.

CROWN POINT.—The water at the lowest level heing well conquered, the ore yield has nearly reached its old standard again. Ahout two-thirds of the ore comes from the 1,200 ft. level, and the halance from the level above. The winzes below the 1,200 are heing sunk as fset as the receding water will allow.

CHOLLAR POTOSI.—Daily yield, 165 tons, all from the regular old workings.

The cleaning out and repairing of the shaft is being actively prosecuted. Over 500 ft. of it will have to he retimbered. This work is now commenced.

HALE & NORCROSS.—Daily yield ahout 45 tons. The winze from the 1,400 ft. level is 110 ft. down toward the 1,500 ft. level. At a further distance of 40 ft. the lowest level will he reached.

BUCKEYE.—Daily yield, 20 tons of ore, averaging about $16 per ton. The incline is down 232 ft. Drifting south from the bottom of the incline is stopped on account of wster. The recsnt ore developments sonth of the shaft are looking still hetter

OPHIR.—Sinking the main shaft deeper was resumed last Monday, and excellent progress is heing made. In order to concentrate upon this point, work is stopped for the present at the 1,200 ft. level. Prospecting the 1,100 ft. level is being activsly prosscuted, however, with more favorable indications in the north drift.

SAVAGE.—Daily yield 162 tons, from the lower levels principally. The ore body developed at that point, contains an occasional streak of very rich ore.

IMPERIAL-EMPIRE. — The drift at the 1,500 ft. level is in quartz, which looks well but carries little or no metal. The drifts at the 1,650 ft. level have reached what is thonght to he the west side of the ledge.

RED JACKET.—Thie mine is being opened and developed in good style.

SUTRO TUNNEL.—Total length, 2,923 ft.

WOODVILLE.—Shaft 162 ft. deep, and sinking deeper, with considerable water to contend with. The fine body of ore mentioned last week ae developed in the tunnel is looking better and more extensive than ever. Daily yield, 30 tons of ore, averaging $30 at mill.

YELLOW JACKET.—Daily yield, 25 tone. The 1,540-ft. station is being opened. The drift through the Kentuck at the 1,300-ft.

level, to connect with the Crown Point for air, had to he discontinned on acconnt of the water in the Crown Point.

McMeans.—Tho ledge of oro developed hy the tnnnel has widened ont to 9 ft., and shows botter and hetter as fnrther penetrated. The tunnel is in 115 ft., and the face shows very snperior ore, which will pay well for milling.

Justice.—The water heing under control, drifting at the 400-ft. level is resumed. The south drift is in milling ore, assaying about $40 to the ton.

Gould & Curry.—Siuking tbe inclino deeper was resnmed last Sunday, and is progressing well.

Knickerbocker.—Shaft down about 300 ft. The new hoisting works are completed and operate smoothly.

Succor.—New shaft down 140 ft. Rock hard, hnt good progress mskiug. Mill not running at present.

Julian.—Shaft down 853 ft. and still in streaks of fair grade ore.

Sierra Nevada.—Daily ore yield 45 tons. The raise above the lower tunnel is yielding some pretty fair ore.

Caledonia.—The 700-ft. etation is being opened for a drift into the ledge.

Senator.—Virginia *Enterprise*, June 9: Yesterday there was landed at the shaft of this mine a full set of hoisting machinery, inclnding boiler, engine and everything complete.

WHITE PINE.

Treasure Hill Mines—Original Hidden Treasure.—White Pine *News*, Jnne 8: Owing to the etrike of the miners, but little development was made during the week. The Wheeler tunnel will cut the ore channel 600 ft. helow the croppings. The ore body in the different openings shows well, and there is every probability that it will hold out.

East Sheboyoan.—Commenced hauling ore to Swansea mill to-day.

Sunbeam.—Sinking goes ahead in the Moscow ehaft, with good ore in sight.

Silver Wave.—The vertical ehaft, for hoisting ore from the Boewell chamber, will connect with the ohamber by the last of next week. Fair headway is made in the Perkins shaft. There is a force of 24 men employed in the works.

Schell Creek Mines—Jupiter.—Schell Creek *Prospect*, June 8: The shaft down 30 ft., is being sunk still further, and rich rock found.

Ontario.—The ore is sulpburets and chloride of silver, and is very rich.

Buena Vista shows well. In the tunnel they have rich ore. There are several shafts dowu, all in good ore.

Mary.—Still running tunnel—ore along it. Work progressing every day.

Schell Creek Canon Mine is panning out pretty well. They are driving a cut into the mountain to ont the main ledge.

Stonehill & Thornton.—Work will he commenced in a few days.

Mountain View is south of the Jnpiter. There is a shaft down on it 25 ft. in good ore which avorages $60 per ton. The ledge is about 2 ft. wide.

Centreville Mines.—The mines in this flourishing camp are looking splendidly. The mill will he in course of erection in a few days.

Queen Spring Mines.—Larbross tunnel is in about 156 ft.; passed through 12 ft. of vein matter. Thie tnnnel is being worked day and night.

War Horse.—Thie mine looks very well.

Arizona.

Items.—Prescott *Miner*, June 1: Work wae progreesing favorably in Tiger and Pine Grove Dists. Jesse Jackson brought over ahout $1,500 in gold bare, heing the proceede of a few daye' run of the Del Pasco 4-stamp mill.

Hualapai.—Los Angeles *News*, June 8: An assay of ore from the Treasure Hill Ledge, near Cerbat, returned $16,640 per ton. A sample of ore from an unnamed ledge realized $9,000 in gold and $5,000 in silver per ton. The silver in both of these ledges ie hornsilver. One of a similar character from the Wild Irish Boy ledge will show an assay yield of from $12,000 to $15,000 per ton. The ore of the Income ledge, Mineral Park, has been worked by an arastra, yielding at the rate of $700 per ton.

Colorado.

Shipments.—Colorado *Miner*, June 6: Hall & Co. have crnshed, sampled and sacked, since our last report, 80,915 lhs. of ore.

The Hopewell, Republican M. is tnrning out ore in large quantities and of remarkahle richness.

Discovery.—Eichenherg, White, Glass, and Wolfong, working all winter, in a tunnel, in Leavenworth M. at 159 ft,. have struck a rich vein of silver ore.

Lavitt.—Central *Register*, Jnne 5: From one shaft, abont thirty tons of ore are raised daily. For the past month the mill ore has yielded from $15 to $25 per ton, under stamps, and the smelting ore, for the same period, has been sold for about $170 per ton.

The La Crosso tunnel is in about 1,000 foet.

Caribou Mine.—Caribou *Post*, June 8: On the east end of the lodo owned by the "old Caribou" Co., a shaft bas been sunk, 170 ft., at the bottom of which is a magnificent crovice of very rich ore.

The first level, 120 ft. from the surface, carries a 15 to 20 inch vein of first-class ore and crevice of second grade ore 2 ft. in width; 50 ft. below this a second level has heen driven.

In the west the main shaft is 290 ft. iu depth. In the hottom there is a orevice of solid ore running across the shaft, 15 inches wide, and a orevice of ore, 2 ft., carrying sulphurets of silver, brittle silver, galena and oopper pyrites.

The fourth level 30 ft from the bottom, 35 ft. long, shows a splendid vein of ore. Over thie ie a "lift" of ground 70 ft. deep, that ie traversed by a drift 140 ft. in length. The 21 ft. adjoinining this, though not ahsolntely worthless is eo considered. The ore crevice of the 81 ft. adjoining this har of ground is rich in native silver and black sulphuret. On a level with this drift the Caribou Co. are driving a level to connect with their shaft, distant about 100 ft. In this, the pay vein, the entire length of the drift, first grade ore, 28 inches in width, and the second grade 20 inches, a total of four ft. The next or second level, has been driven over 200 ft.

Montana.

Deer Lodge Mines.—Cor. Deer Lodge *Independent*, June 8: At Carpenter'e Bar half a dozeu hydraulics and several ground-sluicee are running. Strickland, Green & Pounds' mammoth bed-rock flume will be completed to the richest part of the gulch hy the first of Angust. Twenty Chinamen are employed in the mines at $3 per day—white men receiving from $4 to $5 per day.

At Carpenter's Gulch several hed-rock flumes are running above the mouth of the cañon, and men are at work in all the little side gulches.

Work on the upper Ophir Gulch is still carried on, and it will he several yeare hefore the mines will he worked out. Claims are paying from $5 to $10 per day.

The Buel lode is 14 ft. from wall to wall. It contains large streaks of solid copper ore. The main lode prospecte free gold. Quartz experts think it will pay $15 per ton. A shaft 20 ft. deep has heen sunk, and the walls are well defined and the lode seems to improve.

Several Cos. of white men are working on lower Ophir Gulch and har, eome of whom are making from one to two ozs. a day to the hand. Seven or eight ground-eluice and hydraulic claime are running on Nelson Hill, all of which are paying well,

Two flumes are running in Illinois Gulch. We were shown hy J. M. Jordan several fine nuggets taken from his claim, and among them was one weighing something over 6¼ ozs.

J. S. Yandell, a few days ago, discovered diggings in the har east of French Gulch and helow Ballard & Mellings' flume. Prospects ranging from 2 to 50 cents to the pan were ohtained.

Ashmeade & Allen are running two pipes on Maiden'e Bar, east of the French divide eouth of Bratton's Bar. One Co. of white men and several Chinese Cos. are working in the head of Pioneer Gulch.

Some 20 men and a numher of Chinamen are engaged on the bars hetween Pioneer City and the mouth of Pike'e Peak.

Two hydraulics are ruuning in Trail Gulch, east of Gold creek. Ten men are employed, and good pay is being taken out. H. Smith & Co. started up their hydraulic on Wilson'e Bar, last week, and Fitzpatrick & McKenzie will etart anothor next week. O. M. Timherlake runs three sluices and one hydraulic. Fagan & Co., and O'Neil & Casey, are hydranlic mining in Dry Gulch. All these claims have paid well where clean-ups have heen made.

Discovery.—Harry Richardson and W. Park recently discovered a ledge of silver ore near the Trout mine, at Philipshurg, 3 ft. wide.

Utah.

Big Strike.—S. L. *Tribune*, June 7: Friend Shearman writing from Bingham ooncluded by etating, "have just made a fine discovery in low grade, Bingham. Surface assays so far, $182, $165 and $750."

American Fork.—We hear of a rich strike in this cañon abont 1,400 ft. north of the Miller mine, which is supposed to be a continuance of the Miller vein of ore. The assays are above $400 to the ton in silver and a large per cent. in lead.

Black Jack.—Cor. same: The Lncky Boy is working abont 30 men and is looking better every day.

The French Spy is working 10 men and pushiug tuunel rapidly towards completion. This mine was lately bonded by eastorn capitalists for 100,000. They will tap the ledge about the 1st of next month.

The Beamico & Hyatt parties are preparing to tunnel to the ledge. Shaft down 45 ft..

The Pride of the West is lookiug fiuely; 3 shifts working. Tunnel is about 80 ft.

The Alhambra has 3 shifts working. Tunnel progrossing at the rate of 2 ft. a shift.

The Olo Bull, Royal and Dowu East have each a good showing of chloride ore and are being rapidly developed; $11,000 was offered and refused last week for the 3 locations and the tuunel site.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

S. F. Stock and Exchange Board.

Thursday, June 20.

The sales at the Board for the week ending on Wednesday the 12th inst. amonnted to $2,126,700. The last clean np of the Sierra Nevada mine of 700 tons yielded $4,448. The Hale and Norcross mine yielded last week, 330 tons; the Sierra Nevada, 350 tons; the Savage 1,430 tons, assaying $21.27. The Pioche mine shipped last week $12,350. The Raymond and Ely shipment on June account is $162,000, the last heing $32,000. The Crown Point mine, turned ont last month 2,000 tons of ore valued at $79,000, and the Chollar Potosi 1,000 tons assaying $41.28 per ton. The last clean np at the Eureka (Grass Valley) mine, was 550 ounces of amalgam. The snm of $6,300 wss sent down from the Kentnck on the 14th and 18th inst. The Meadow Valley Mining Co's. dividend payable to-day amonnts to $60,000 for the month.

The market has fluctuated considerably this week. On Change the stocks were in moderate demand, and prices weak and irregular. The next day the market was slightly improved, being a little more active. On the 17th, there was an advance on the whole list, and stocks seemed to he in better favor. On the 18th, they were weak again, most kinds showing a decline from previous days' sale. Wednesday, the 19th, there was a fair husiness done in the Board, and prices were generally higher, Belcher advancing $77, and Crown Point, $17, over previons days' sales. To-day Stocks were quiet and husiness was light, and compared with yesterday's sales, Belcher advanced $20; Kentuck, $5; Ophir, Justice, and Raymond & Ely, each $1. Savage, Segregated Belcher, and Yellow Jacket, each declined $3; Caledonia, Chollar-Potosi, Hale & Norcross, and Meadow Valley, each $2 ; Alpha, Cons. Virginia, Crown Point, and Exchequer, each $1.

There are 192 miles in the State of Nevada, nsed in the crnshing and reduction of various ores. Their capacity eqnals 8,325 horses; they carry 2,848 stamps, and costs over $10,800,000.

The Sutro Tunnel.

A *Bulletin* correspondent writes as follows from Washington, D. C., under date of June 3d: The report of the Mining Committee on Mr. Kendall's hill, to aid the Sutro Tunnel project, was made to the House to-day, and is even more favorable than has hitherto been expected, as the Committee recommend not merely an endorsement of the interest on the bonds to be issued, but an absolute loan of two million dollars in cash, to be advanced to the Company out of the proceeds of the sale of the public mineral lands or other money in the United States Treasury, at the rate of $50,000, for every 500 lineal feet of its tunnel or shafts completed, provided an additional equal amount shall have been expended on the same 500 feet of work by the Company. The Government advances are to be secured by a first mortgage upon the whole of the Tunnel property, and are to be repaid with five per cent. interest out of the revenues of the Company, one-half of which must be turned over to the United States Treasury semi-annually until the whole amount of the loan is liquidated. The other provisions of the bill in regard to the character and dimensions of the tunnel and its appurtenances, and also the appointment of Commissioners to report on the progress of the work, are about the same as those contained in the previous Sutro Tunnel bills, and need not be recapitualated. The investigation of the Committee in this subject has been remarkably laborious and prolonged. A cross-examination by Sutro on the one hand, and Mr. Sunderland, representing the Bank of California, on the other. Long arguments have also been made, which, together with the voluminous testimony, are now reported to the House. The following is the report of the Committee, which is signed by all its members excepting Mr. Sargent. It will be read with interest.

Report of the Committee on Mines and Mining.

The Committee on Mines and Mining, to whom was referred H. R. 1173, entitled "A bill to aid in the construction of the Sutro Tunnel from the proceeds of the sale of mineral lands," after careful consideration, have prepared the accompanying substitute, and recommend its passage:

Your Committee have patiently and carefully investigated all the questions having any bearing upon the subject; they have heard the evidence of the commissioners and other experts; they have listened to the arguments for and against the bill; and, without commenting at length upon the details of their investigations, beg leave to submit the following statement of facts and conclusions:

1st. Our mineral domain is almost unlimited in extent, and of incstimable value.

2d. The mines on the Comstock lode are the most valuable in the world.

3d. They have yielded already $130,000,000 in bullion.

4th. The present annual yield exceeds $15,000,000.

5th. Their future yield, by means of a deep tunnel, will be almost incalculable.

6th. Deep tunnels are necessary for the full development of our mining interests.

7th. The Sutro tunnel is of the highest importance to the future profitable working of the mines on the Comstock lode.

8th. The construction of this tunnel was authorized by the Legislature of Nevada.

9th. The mining companies on the Comstock lode contracted for its construction.

10th. The Legislature of Nevada memorialized Congress to aid in its construction.

11th. Congress, by special law, endowed it with certain rights and privileges.

12th. Congress reaffirmed those rights by a refusal to interfere with them.

13th. Congress again reaffirmed them by provisions in two general mining laws.

14th. Congress sent out a commission to report upon the facts concerning it.

15th. The Commissioners made a report, recommending the work to favorable consideration.

16th. Some points in the report not being entirely clear, the Commissioners were fully examined by your committee.

17th. Other witnesses, amongst whom Professor Raymond, the United States Commissioner on Mining, were also examined.

18th. The testimony (which accompanies this report, embracing 810 pages), makes a conclusive case in favor of the tunnel.

19th. The construction of the tunnel is entirely feasible.

20th. It will cost from $4,000,000 to $5,000,000.

21st. It will take from 2½ to 3½ years to complete it.

22d. It will be of immense benefit to the legitimate owners of the mine.

23d. It will secure the health of the miners by good ventilation.

24th. It will create an outlet for escape in case of fire.

25th. It will establish a new basis of operations 2,000 feet below the surface.

26th. It will drain the water to that depth by its own flow, and dispense with the numerous steam engines now required.

27th. The water contained in the mines may be utilized as a great water power to pump the water, by means thereof, from below the tunnel level.

28th. Greater depth may be reached thereby than has ever been reached before on any mines in the world.

29th. It will stimulate explorations on all portions of the Comstock lode, and may increase its yield to $50,000,000 per annum.

30th. It will develop several lodes in the course of its construction.

31st. Immense quantities of low-grade ores exist in the Comstock lode and other lodes cut by the tunnel.

32d. These low-grade ores can only be utilized by means of concentrating works.

33d. Extraordinary facilities exist at the mouth of the tunnel for the erection of improved concentrating and reduction works.

34th. The tunnel itself will furnish sufficient water for concentrating and amalgamating purposes.

35th. Cheap motive power can be secured with coal from the Rocky Mountains and firewood floated down the Carson river.

36th. As a geological survey, penetrating into this argentiferous mountain, it will be of the highest value to science.

37th. It will serve as a pattern work for all other mining districts.

38th. Its success will give confidence in mining operations.

39th. A practical illustration of the downward continuance of mineral lodes will give a high value to our mineral domain.

40th. It will make capital flow in that direction.

41st. It will result in the construction of hundreds of tunnels by private enterprise.

42d. It will populate our vast mining regions, and create millions of dollars of taxable property.

43d. It will establish a mart for western produce and eastern manufactures.

44th. The total yield of gold and silver will be largely increased.

45th. The increase of the stock of the precious metals has a tendency of increasing the money value of all property.

46th. The increased value relieves the burdens of the people by reducing the rate of taxation.

47th. It has the most important bearing on the payment of the national debt.

48th. The Sutro tunnel is now in full progress of construction.

49th. The company has secured funds to the amount of $1,500,000, and is expending upon the work at the rate of $50,000 per month.

50th. The work is of national importance, and the aid provided for in this bill will secure its early completion.

51st. The security to the Government is unquestionable, ample, and satisfactory; one-half of the royalty alone yielding at the present rate of production $365,000 per annum.

52d. Under the bill reported the aid extended shall not exceed $2,000,000.

53d. The Company is required to expend an equal amount to that loaned by the Government.

54th. One-half of all the income will be paid over to the Government semi-annually.

55th. The sum loaned, together with the interest, will probably be repaid to the Government within a few years after its completion.

56th. No money shall be paid until the commissioners to be appointed shall report the completion of each section, as prescribed by law.

57th. A non-compliance with the provisions of this bill will forfeit all rights under the same.

58th. The aid extended only applies to the first four miles of tunnel to the Comstock lode.

59th. This first section of the tunnel will form, as it were, the main artery or highway, from which one hundred miles of branch tunnels may be constructed.

60th. No further aid will be required; for after the tunnel reaches the mines, the income will be sufficient to make it self-sustaining.

61st. We would in conclusion indorse the language used in the closing paragraph of a report to Congress made by a former committee, recommending a loan of $5,000,000 in the following words:

"That taking into consideration the magnitude of the undertaking, the large yield of bullion which will be directly secured thereby, the great influence by its successful completion upon all our mining interests, the stimulus it will give to mining generally, the positive proof it will furnish of our immense mineral wealth, and considering the importance of attaining these results, in view of our large national debt, ordinary wisdom and foresight should command that the aid asked for the construction of this important work, or a much larger sum, if it were necessary, should be granted, even were no security whatever offered for its payment.

Henry Waldron.	W. L. Sessions.
Nath. P. Banks.	F. E. Shober.
W. C. Smith.	P. M. B. Young.
J. S. Negley.	C. W. Kendall.

Washington, June 3d, 1872.

[The committee refers to a number of works for detailed information on the subject embraced in the report, but as the above gives their reasons for recommending the loan we omit the reference.—Eds. Press.]

The Generation of Petroleum.

The recent development of the reproductive power of petroleum wells which had been for some years abandoned because they were believed to be exhausted, is not alone a matter of value to the owners of the territory that was until lately prosumed to be incapable of further production, but it affords a more trustworthy basis than any hitherto obtainable for forming an approximate correct opinion concerning the chemical process whereby petroleum is generated. Until lately, a popular opinion prevailed that petroleum, in spite of its name, was the product of coal; and so nearly was this idea general among a majority of people, that many foreign receivers of petroleum are still accustomed to order it as "coal oil." The belief, however, that the terrene oil of Pennsylvania and Canada is exclusively a product of bituminous coal may now safely be pronounced to be an error. There is certainly no evidence that coal is not one of the substances from which petroleum is distilled; but, at the same time, it is a somewhat strange fact, allowing a proper degree of credit to the belief that coal does not enter into the composition of petroleum, that no coal beds susceptible of being worked are known to exist within fifty miles of the oil-producing territory. Again, it is a manifest and recognized fact that carbon does predominate as an integral essence of petroleum; and the other fact that the oil territory of Pensylvania is surrounded by beds of bituminous coal, renders it eminently reasonable to believe that coal enters largely—if not, indeed, more largely than any other substance—into the process of distillation whereby petroleum is produced.

Petroleum is certainly a mineral oil. But whatever may be the number and chemical variety of the minerals from which it is formed, the distillation of it is more intimately associated with limestone than with any other mineral. Sandstone is also found in boring oil wells, but it is from the pores of limestone that, in the chemical process of extracting oil from the minerals found in connection with its production, the greatest quantity of petroleum is taken. It is singular that, in boring for oil, no coal has ever been found, even in the smallest quantities, while sand, sandstone and limestone abound. The inference, therefore, cannot be escaped that petroleum is the product of the distillation of at least two, and probably of more than three, distinct mineral properties. In the process of manufacturing refined oil, the crude article yields three different products—naptha, kerosene and residuum, a fact which certainly supports the belief that crude oil is the product of three different minerals. So far as concerns the contribution by coal of an integer in the chemical process by which petroleum is produced in and from certain geological strata, it may be remarked that the "shale" oil produced from bituminous coal in England, is very different from American petroleum; in that, the American naphtha must be used in order that the latter may be burned in lamps. Another fact that favors the inference that petroleum is mainly produced from or generated through limestone, is that petroleum has been extracted from limestone found in the neighborhoods of Chicago and Terre Haute, Ind. In regard to the reproductive powers recently developed in the Pennsylvania territory believed to have been exhausted, it affords two favorable presumptions: First, as a partial assurance that the distillation of petroleum is a continuous process; and next, that the formerly abandoned territory was given up because the machinery for extracting petroleum from the earth exceeded in its power of exhausting the fluid, the generative power by which it is produced.—*Petroleum Monthly.*

An Old Invention Turned to Account.

The Virginia *Enterprise* mentions the successful application of Archimede's screw in raising the tailings of the Santiago Mill on the Carson River. The mill is situated so near the level of its water in the river, and the tailings are discharged so low down that heretofore it has been found impracticable to save them, if not impossible. They have been allowed to flow into the river and waste for the past ten years. One of these screws 28 inches in diameter and 44 feet long has been placed in position, and raises the tailings to a hight of 23 feet. The screw consists of a core of wood into which are inserted iron rings, in such a way that they wind spirally round the central shaft like the thread of a screw. This as it now stands is then inclosed in a casing of wooden staves hooped on the same as a barrel is hooped over.

The mode of using is as follows:—The lower end is placed in a large agitator, standing at the point where the tailings are discharged from the mill, while the upper end is supported by a frame erected at the point where the tailings are to be discharged. The screw stands at an angle of 45 degrees, and to run both it and the agitator costs but four-horse power. The agitator has nothing to do with the efficiency of the screw; it would work equally well in a quiet pool. The part the agitator plays is merely that of stirring up the fine particles of tailings, and keeping them afloat in the water until caught up and elevated by the screw—without the agitator the tailings would settle to the bottom of the tank and little else than water would be pumped up. At the top the screw discharges the tailings (in the shape of muddy water,) into a sluice which carries them to a huge reservoir 1,000 feet distant, where they settle, and the clear water runs away. The great

Value of the Contrivance

Will be seen when we state that the mill is now crushing 2,500 tons of ore per month, and that after it has once passed through the mill this same ore is still worth $5 per ton, which sum may be obtained for it in the reservoir where it is saved. According to this estimate, $12,500 per month is saved by the use of the Archimedan screw. It carries up and deposits in the reservoir every ounce of everything, water and all, that passes through the mill. The mill has been running ten years. At first its capacity was 1,600 tons per month, but this was afterwards increased to 2,500, its present capacity. Counting the loss for ten years at 1,600 tone per month gives 192,000 tons, but as part of the time the loss was 2,500 tons, we may safely set the total loss down as being in round numbers 200,000 tons, which at $5 per ton would be an even million that has floated off down Carson River. We are informed that screws will be put up at several other mills on the river where tailings have been lost in the same manner for many years.

Wages of Mechanics in Europe.—The following figures are from the British Foreign Secretary's Report to Parliament, being the average daily rate paid to mechanics, after being reduced to our money:

Austria	$1 00	Sicily	30
Belgium	60	Portugal	40
France	1 10	Prussia	75
Denmark	60	Russia	75
Italy	40	Sweden	60
Netherlands	75	Switzerland	60
Norway	60		

When we consider that this is the average paid for skilled labor, and that unskilled or half-skilled labor is only paid one-half as much; and, again, that many of the workmen labor twelve hours a day, the difference in favor of the workmen in the United States will be very apparent. In England the prices are about one-quarter more than paid on the continent.

Professor Goltz, Königsburg, in his experiments upon the nervous centre of frogs, finds that if you take out the brain, and then rub a finger down the frog's back, the creature will croak as if pleased. Frogs must be easily pleased.

Useful Information.

How they Cut Veneers.

Many persons, doubtless, have wondered how these thin layers, or shavings, of mahogany or rosewood, are cut or sawed so thin, and yet so true as to thickness from those hard woods. And still more wonderful, how those very thin, hard wood paper hangings are made. And yet, wonderful as they appear, the mystery vanishes in a great measure when one sees the process, though it must still be admitted that it is a triumph of human skill and perseverance. How long it has been since veneers have been made and used, probably nobody knows; but the manufacture, like all other inventions, has progressed to perfection by degrees, through unwearied labor and improved mechanism.

Most approved process for cutting veneers, may be thus described:—The log to be shaved is cut into lengths of about ten feet. It is then split lengthwise, and the rounded side hewn or planed down, so as to make a face about six inches broad, perhaps. And as thus prepared, the piece is six inches in thickness. It is then soaked in warm water, several hours for the softer woods, and days perhaps for the harder kinds. When the shaving is to begin, the water is brought to the boiling point, and the stick taken out of boiling water, all hot and steaming. It is then taken to the machine and fastened to a cast-iron plate, horizontally, by screws. This plate is about a dozen feet long, by four broad, and stands vertically, the heart of the stick being next the iron. The fastening is by screws, which pass through the plate and enter the wood about an inch. A dozen screws perhaps are put into a stick a foot broad. This plate moves up and down, with the stick fastened thus firmly, and horizontally, to its face. In front is a knife, fixed solidly, some ten feet long, sharp as a razor, and made like a chisel, with the bevel from the wood. This knife stands vertically, with the edge upward.

When the stick and knife come together, the former comes down and strikes the knife through its whole length; a shaving is pared off, and this, in thickness is just what the operator pleases; it may be thick as a veneer, say twenty-six or twenty-eight or thirty, more or less to the inch, as veneers are made; or it may be as thin as the paper hanging, which are 200 to 300 to the inch. The machine works automatically, the plate with the stick going up and down, while the knife moves forward at every elevation just enough to get in place to shave another veneer when the sticks descends. As fast as the veneers are shaved off they are taken by two men and laid in a pile. Ten or twelve are shaved off in a minute. Care of course is requisite, toward the close of the cutting, that the stick is not shaved so close that the ends of the screws are exposed and hit the knife. But as the screws only enter the wood just so far, somewhat less than an inch, the work is stoped before that point is reached. The removal of the piece from the plate, through which the screws passed, completes the operation. And this piece is a plank, or rather board, of about an inch in thickness, which may be cut up for other uses as the greater portion is not damaged by the holds. The veneers are as much finished upon one side as upon the other, and perfectly even in thickness. After being cut they are spread, to dry, being turned up edgeways to accomplish that end.—*Cabinet Maker.*

What is Water?—Water is *rust.* The red powder that falls from iron which has long been subjected to the action of moisture, is rust of iron. It is the oxide of metal, and so is water. Water is the rust of hydrogenium, a true metal. This wonderful element no human eyes have ever looked upon, and probably never will, as in its free state it exists only in the form of an invisible gas. Quite recently science has demonstrated experimentally, what has long been suspected, that hydrogen gas is a metal, and capable of assuming a solid form in alloys. Oxygen, by uniting with this gaseous metal, rusts, oxidizes, or burns it, and water is the rust or ashes. This strange metal, hydrogenium, and its oxide, play an important part in all the operations of nature. It is not alone confined to the little ball of earth upon which we live, but it exists in the stellar worlds above us, and in those mighty points of light, the nebulæ, which have so long puzzled and perplexed the astronomer and men versed in the physical sciences. The recent discoveries by means of the spectroscope, have proved that this element enters largely into the unformed, chaotic masses of matter, moving in space, of which the worlds are made. It is ready, when the formative act is fully accomplished, of taking its place, in combination with oxygen, as water, to aid in the sustenation of animal and vegetable life upon spheres so far distant that our imagination even cannot reach them.—*Fireside Science.*

What is an Indian Citizen?—A decision has been made by the Secretary of the Interior to the effect that Indians may and do become citizens by an abandonment of the tribal organization. The Ottawas and Chippewas have abandoned such organization and have become subject to the jurisdiction, to all intents and purposes, of the United States, and become citizens under the Fourteenth amendment. They are entitled to make homestead entries, and in every respect are subject to the rights and privileges of native born citizens. The Fourteenth amendment excluded "Indians not taxed," and the supreme court has decided that the tribal relation remains, Indians are not taxable, which by implication means that when that relation ceases they may be taxed. Taxation and representation then go together, the Indian becomes merged in the mass of American population and one of it. This is one step further in the universality of rights under the American government.

The Weather Waste of Coal.

Dr. Varrentrapp has made this the subject of an investigation, and as a result states that the amount of loss suffered by coal from exposure to weather is considerable, far greater, indeed, than is generally known.

The results of his analysis show in some cases a total loss in weight of a specimen, from this cause, amounting to 33·08 per cent., while its deterioration in quality for purposes of fuel or gas-making reached a still higher figure.

This change consists in a slow combustion, in which the volatile constituents—which are most valuable combustible elements—are gradually eliminated, while the relative proportions of carbon, ash and sulphur are comparatively augmented.

It might be expected, now that the nature of this change is indicated, that anthracito (which has already gone through a very similar process in becoming what it is, by the loss of its bituminous matter) should suffer least of all coals from this action, and the result of analysis show this to be the case. The density and compactness of this variety, aside from its chemical character, protect it in no inconsiderable degree.

The Cannel coals rank next in their power to resist deterioration from this source; while the bituminous varieties are the most susceptible.

The experiments of Dr. Varrentrapp are of such direct and practical importance that all who are engaged in the mining, transportation, storage or consumption of coal can study them with profit.

It appears, from accurate test of a number of samples before and after exposure, that all the valuable properties of the coal had deteriorated.

The cooking quality of the weathered coal diminishes with its gas-yielding quality, the author informing us that a sample of coal yielding, when freshly mined, a firm, coherent coke, after eleven days' exposure, yielding a coke of no coherence, and in all the samples tested the rule was absolute that the longer the coal had been exposed the greater was the inferiority in the quality of the coke it produced.

The gas-yielding quality decreased in one instance 45 per cent., and the heating power 47 per cent. while the same sample under cover lost in the same time but 24 per cent. for gas purposes, and 12 per cent. for fuel.

These experiments go far to explain the almost universal inferiority of the slack or waste coals in heating power when prepared for burning, even though some combustible material like pitch or tar is used in their cementation. It indicates, too, the imperative necessity of keeping coals amply protected from the deteriorating action of the air and moisture by keeping them constantly dry and under cover.

Something About Wills.—Here are some rules governing the making out of wills, which may prove important if not interesting. A will cannot be made in language too simple or concise; it must be written in ink, on paper or parchment; and, if contained on one sheet, must be signed at the end by the testator, in the presence of two or more witnesses, and, if written on more than one sheet, the testator and witnesses had better sign each sheet. The witnesses must rigidly comply with every particular required by the attestation clause, at the end of which clause they must sign their names. A codicil to the will is to be made with the same regulations as the will itself, and may be written thus: This is a codicil to my last will and testament, bearing date the——day of——18—. and which I direct to be taken as part thereof. I give, devise, and bequeath, etc. As witness my hand this——day of——. Obliterations or alterations are dangerous, and when of necessity made, ought to be signed by the testator and witness. Marriage after making a will, renders the will void. It is not indispensable for a witness to know the contents of the will, which may be so folded as to prevent any other portion than the signature and attestation clauses being read.

How to Fasten Rubber to Wood and Metal. As rubber plates and rings are nowadays need almost exclusively for making connections between steam and other pipes and apparatus, much annoyance is often experienced by the impossibility or imperfection of an air-tight connection. This is obviated entirely by employing a cement which fastens alike well to the rubber and to the metal and wood. Such cement is prepared by a solution shellac in ammonia. This is best made by soaking pulverized gum shellac in ten times its weight of strong ammonia, when a slimy mass is obtained, which in three or four weeks will become liquid without the use of hot water. This softens the rubber, and becomes, after volatilization of the ammonia, hard and impermeable to gases and fluids.

To Protect Walks from Weeds.—Take one gallon of gas-tar and about a half a pound of air-slacked lime, boil and incorporate them well together and apply the mixture with a common long-handled whitewash brush. This will dry in a few hours if put boiling hot, and will kill off all young weeds and prevent their growth.

Good Health.

Sea-Sickness.

The cause of sea-sickness, and the question of its curability, have both been the subject of a good deal of discussion. Some have asserted that it is always due to mere imagination or nervousness; but though this is undoubtedly a frequent cause of the malady, it is certain that it is not the invariable one. We have seen people sea-sick when the ship was moving more smoothly and steadily than a railway car and it was easy to believe in that case that the expectation of the nausea was all that produced it. On the other hand, people who suppose themselves proof against an attack of the kind have been the victims of a sudden seizure. They neither feared nor anticipated anything of the kind, and it could not have been brought on by any mental cause whatever. Animals, moreover are not exempt from sea-sickness. We have known a cat—not a "land-lubber" of a puss, but one of sea-going habits, that had crossed the Atlantic more than once—to be wretchedly sick in very rough weather; and we have heard of horses and dogs that were similarly affected. No one will assert that in these instances imagination had anything to do with the nausea.

Dr. Wollaston suggested, more than sixty years ago, that sea-sickness results from pressure of blood upon the brain; and it is well known that injury or pressure on the brain is almost invariably attended by vomiting, which is indeed its earliest symptom. Dr. Wollaston explains the way in which the pressure upon the brain is produced by the motion of a ship at sea, by reference to the action of mercury in the tube of a barometer. He says that "If a barometer be carried out to sea in a calm, the mercury will rest at the same height as when on shore; but when the ship falls by the subsidence of the waves, the mercury is seen apparently to rise in the tube which contains it." He considers that the action of the blood on the brain, at the moment of the descent of a ship is identical with that of the mercury in the barometer, and that there is an actual pressure, and even a blow, which, by frequent repetition, produces nausea and vomiting. The action in both cases is due to the *inertia* of the liquid, which tends to remain where it *is*, and not to follow the movement of that which contains it; in other words the mercury stays *up* when the barometer tube goes *down*. In like manner the blood tends to remain stationary when the head is carried downward, and the result is virtually the same as it would be if the blood were forced upward into the head. This produces an unnatural pressure upon the blood-vessels of the brain, and nausea and vomiting follow. This view is confirmed by the fact that the nausea is most marked when the ship is descending.

The sickness induced by waltzing is to be explained in a similar way. In this case, the blood is forced up into the brain by centrifugal force, just as liquid tends to rise in a vessel that is whirled around rapidly. Swinging also sometimes causes nausea. The only rational way of averting sea-sickness, is given as follows by Sir James Anderson:—

The first point is wholly to avoid the upright posture. Every one knows that it is a common practice to lie down, and this is done almost instinctively, but it is also known that to do so, though frequently successful, is not invariably so. The way in which the motion in a swing affects the brain affords the proper explanation why lying down is not invariably successful; and shows that it is necessary, not only to take a recumbent position, but to lie in the right direction. A person lying down with the feet towards the bows of a ship is, while it descends in pitching, in the same position as a person in a swing descending forwards, in which case we have seen that sickness is produced by blood being forced upon the brain. On the contrary, a person lying down with his head towards the bows is, during the descent of the ship, in the position of one descending backwards in a swing, in which case the pressure by the blood will be towards the feet, and, therefore, relief rather than an inconvenience will be experienced, the tendency being to reduce the natural supply of blood to the brain. It is necessary, not only to lie down, but to do so with the head to the bows; and it is highly desirable that this position should be assumed before the ship begins to move. There is a secondary advantage to be gained by closing the eyes, and so shutting out the confusion arising from the movement of surrounding objects.

Consumption.—An English physician has written a book to prove that "consumption *always* originates from the breathing of prebreathed air;" and, though that may be putting it rather strongly, there can be no doubt that rebreathed air is one of the most fruitful sources of this and many other forms of disease.—Dr. Roux says that the French, by daily using copper cooking utensils, take copper enough into the system to render its detection in the blood an easy matter.

Snakes make sad work in India. Eight thousand persons die annually from snake-bites. In one province, nine hundred and thirty-nine cases are reported. Ammonia being freely administered, seven hundred and two cases were cured. In New Zealand the doctors find that a very much reduced quantity, introduced by injecting under the skin, is yet more successful.

How a Person May be Choaked.

All that we eat or drink passes over the top of the windpipe, without a particle ever entering it, although the opening is larger than a dime, because the very act of swallowing draws over the open top of it a fleshy trap-door, which fits so closely that not even a particle of air can pass; but at the instant of swallowing, it opens up with a spring, and we go on breathing as if nothing had happened; but if we attempt to swallow anything too large, this trap-door being at the narrowest part of the passage, is kept closed, not a particle of air can enter the lungs, and we die in a moment of suffocation, as in drowning or smothering.

If you chew a piece of dried beef for some time, there will be a white remnant left which there is no inclination to swallow; if it be taken and picked apart, it will appear to be made of little strings, tough and strong; these were attached to the more flesh-like parts, which were chewed and swallowed. If, in eating, a man has a sharp knife, and cuts his meat wholly in two, he may put two or three of those pieces in his mouth, and chew and swallow without danger; but if the knife is dull, does not divide the pieces wholly, two pieces may be tied together with one of these little strings, and while you have swallowed one part nearest the swallow, the other part may be near the teeth, and both held by the string, which holding the two parts together and hanging across the trap-door, prevents it opening, and death follows in an instant; hence the practical value of sharp knives at the dinner table.

A long hair in a mouthful of food may so entangel it in the act of swallowing as to cause a choaking to death; this is what is meant by being "strangled by a hair." "String beans" may occasion a choaking to death in the same way, if not carefully "strung." Hence all food should be cut fine; should be taken into the mouth in small pices, chewed thoroughly, swallowed deliberately.

Most readers have suffered considerable inconvenience from something "going the wrong way;" this is occasioned by a single drop of water, or atom of solid food, a crumb, or other thing slipping into the windpipe and falling down to the lungs, causing an instantaneous, spiteful, angry, dry cough; it is because nature was alarmed by an unnatural and unwelcome visitor, and takes this her only means of ejecting the intruder. If the particles is large or heavy, the surgeon must be called to cut open the windpipe and remove the substance.

A person cannot laugh or speak a word unless the top of the windpipe is uncovered; but if a laugh is provoked, or a word attempted to be spoken while in the act of swallowing, and just before the particle has fully passed the trap-door, it is raised a little, a drop or a crumb falls into it, and hence the mischief. Hence, in eating, do not attempt to speak until the "swallow" is clear.—*Hall's Journal of Health.*

How to Purify the Blood.

The stomach makes blood, and the lungs give life to the blood. If any individual has two gallons of blood in his body, and the food taken into the stomach makes one pint of blood in twenty-four hours, in sixteen days he would have new blood. The human body, consisting of bones, muscles, sinews, blood-vessels, organs of reproduction, nutrition, respiration, and of thought, etc., is constructed, nourished and sustained in accordance with certain laws common to organized beings. It is made up of the elements that surround us, such as animals, vegetables, and water. These substances, taken into the stomach, undergo the process of digestion, and the chyle, or nutritive portion, enters into the composition of the blood, and by this means is brought in contact with all parts of the system. Our bodies are always undergoing change, constantly wearing and wasting away, and constantly supplied and repaired by food, drink, and air; particles are displaced and thrown off, and new particles are deposited in their places, so that, by this gradual but constant exchange of particles, it is estimated that the soft parts of our bodies become entirely changed in the space of about one year, and our bones in seven years; hence, all the flesh of our bodies at the present time, will, in the course of one year, pass away, and, by the combination of new particles, its place will be supplied; and in seven years a like change will take place in bones, giving us entire a different body from our present.

Heart Disease.—Those ladies who suffer from the distracting grievance and disability of being treated too much as drawing-room pets, and shielded too carefully from the rougher blows of the battle of life, may possibly learn resignation, if they cannot derive complete consolation from some dry but significant researches which Dr. Quain has made. Enlargment of the heart, one of the most distressing and fatal diseases, is more than twice as frequent in males as in females, the precise proportion being eight to three. This remarkable liability to the enlargment of men's hearts, as compared with those of women, is, he thinks, unquestionably due to the greater amount of work and anxiety which, in the present dispensation, falls upon men. Ladies may take this fact to heart, and reflect whether, in claiming the rights of women, they may not at the same time incur the risks of men, and with them a new and unexpected form of disability. They might do wisely to rest content for their sex, with hearts suffering, it may be, from those tender affections which often pain, but never kill.—*British Medical Journal.*

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. R. EWER, OZO. H. STRONG, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTION AND ADVERTISING RATES.

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	$3.00	7.50	20.00
One inch..... 2.00	5.00	14.00	38.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special ratee.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Clube of ten namee or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittancee by regietered letters or P. O. orders at our riek.

Englieh and Colonial eubscriptioae, post paid, per year, £1 3s.; 6 months, 12s. Advertisemente, per line, first insertion, 1e.; subeequent insertions, each, 8d. Large advertisements at epecial rates.

ILLUSTRATIONS AND REPORTS OF MINING ENTERPRISES WANTED.—Drawings or photographe of mining worke that are of general intereet to our readers are eolicited for publication in this journal. Official reports of Companies, and deecription of mines of importance, or of special interest, are aleo deeired. Sketchee of any new method and dieeoveriee will be very acceptable.

San Francisco:

Saturday Morning, June 22, 1872.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wedneeday, June 22, 1872.—Legal Tenders buying, 88½; selling, 89. Gold in New York to-day, 114.

Table of Contents.

ILLUSTRATIONS.—Low Heat Evaporators; The Flying Fish, 385. The Burleigh Rock Drill, 393.

EDITORIALS.—An Unexpected Disappointment; Japanese Advancement; An Invention Wanted, 385. Academy of Sciences; Aeeay of Silver Bars in the East Indian Mint, 392.

MINING SUMMARY.—Reports from minee in various Statee, Counties and Districte; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 388-9.

CORRESPONDENCE.—Mines of Humboldt County, Nevada; Mismanagement in Milling; Steamehip husiness at Panama, 386.

SCIENTIFIC PROGRESS.—Effecte of Electricity on Milk, Etc.; Oomhustibility of Iron; Light and Radiant Heat; The Agassiz Expedition, 387.

MECHANICAL PROGRESS.—Faults in the Plans of Dweiiinge; Important Advance in Paper-Making; Fireproof Buildings, 387.

USEFUL INFORMATION.—How they Cut Veneers; What is Water; What is an Indian Citizen; The Weather Waste of Coal; Something Ahout Wiiis; How to Fasten Ruhher to Wood and Metai, 391.

GOOD HEALTH.—Sea-Sickness; Oonsumption; How A Pereon May be Choaked; How to Purify the Blood; Heart Disaee, 391.

DOMESTIC ECONOMY.—Cooking and Health; How to Make Hoe-Cakee; Cucumber Saiads; Home-Made Yeast; Oranges; Graham Bread; To Clean Lamp Chimneys; To Boii Eggs; Selected Recipes. 394.

MISCELLANEOUS.—A Surface View; The Sutro Tunnel; Tne Generation of Petroleum; An old Invention Turned to Account; Wages of Mechanics in Europe, 390.

Tuolumne Reunion.

The ex-residents of Tuolumne county, held their fifth annual picnic and reunion on the 17th inet. at Badger's Park, Brooklyn, Alameda Co. Tbe aesociation comprises tbe residents and ex-reeidents of "Old Tuolumne" and was formed for the purpose of renewing the acquaintance and friendship formed in early daye, and keeping up the reminiecencee and memories of by-gone daye. Although Tuolumne was once one of the most populous counties in the State, the exhaustiou of her placer minee, caused a rapid decline in her prosperity, and the old reeidente are ecattered far and wide. Once a year they meet at eome appointed place to talk over old timee, and enjoy themselvee generally. Tbere wae a larger attendance at thie laet reunion than any of the previous onee, and of couree everybody had a fine time.

Tbe Preeident, W. G. Dinemore, of Oakland, called the aesociation to order, and after eome music by the Handel and Haydn Society, the Hon. H. P. Barber delivered the ueual oration. The Secretary C. E. McCueker read the namee of the officere, for the eneuing year who were unanimouely elected. Among them were Z. H. Cunningham of San Francieco, Preeident; L. P. McCarty, (Our Travelling Correspondent) Vice Preeident; O. E. McCusker Secretary and Treaeurer.

FLOOD.—The high water of the Gila river haa caueed a flood in Arizona City, A. T. The Colorado and Gila rivers were still rising fast when the news was sent. New river which has not run for aaveral years is, at New River Station, 70 miles west of Fort Yuma, now 100 feet wide and from fifteen to twenty feet deep. Stage lines are delayed, and ferry hoats long out of use have heen put in operation.

Academy of Sciences.

Tbe regular eemi-monthly meeting of the Academy wes beld on the 17th inet. Tbe Preeident, Profeesor Davidson, in the chair. Dr. J. B. Pigne Dupuytren, wes elected a member of the Acedemy. A number of pemphlets, etc., from the Smitheonien Institute at Washington were received and duly acknowledged. Several names were propoeed for membership to be acted on at the next meetiug. It was announced that the American Associetion for the Advancement of Science, which wee expected to meet in thie city in August, had notified the Academy that a chenge in the arraugemente had heen mede, and that they would meet in Dubuque, Iowa, inetead of here. A statement of the reaeons why this change was made will be found iu another column.

Death of Scientists.

R. E. C. Stearne announced the deeth of Edmund Ravenel, of Charleston, S. C. Robert Smith, of Philadelphia, who died at St. Thomas, W. I. Dr. Hubbard, of Long Island, N. Y., and Dr. William Stimeon, of Cbicago, who died at Ilchester, Md. Dr. Stearns read a paper on the life and services of the late Dr. Stimson, late Director of the Museum of the Chicago Academy of Sciences, and preeented a seriee of resolutions deploring hie loee, which were unanimously accepted. Professor Davideon presented a

California Boomerang,

From Samuel Shrewsbury, of Loe Angelee County, being one of two which tbat geutleman bad obtained from the Indiane there. The Indiane appeared to underetand their uee but these were all that have recently been found in their possession. The old recorde of Los Angeles however, contain references to the boomerang as an implement of warfare among the Indiane of that locality. The diecovery preeents an interesting subject suggesting communication between the North American eavages and the Australian nativee at eome former period. Prof. Davideon eaid that in a long experience on tbie Coast as far north as Alaska, tbat he had uever eeen them among the Indians.

The Inyo County Earthquake.

Professor Whitney, the State Geologist, being preeent was invited to relate his expèrience and observations of the earthquake region during his recent trip to Inyo county for the purpose of studying the effecte and cauees of the earthquake. The Professor stated that he had prepared a popular etatement of eartbquake theoriee, etc., which would appear in the next number of tbe *Overland Monthly*, and that the ecientific points he wonld bring before the Academy at a future meeting.

New Specimens.

R. E. C. Stearne presented a specimen with deecription of a new epecies of Siphonaria of California, which be called the *Siphonaria Brannani* from tbe beach of Santa Barbara Island; also epecimene of a new epeciee of Mangelia from Monterey Bay—called *Mangelia Interlirata*. He also presented a apecimen of the maguey plant, from which the Mexicans manufacture an intoxicating drink called *aguadiente*. Prepared fibre from tbe leaves of the plant accompanied it; the fibre ie white and etrong, and its adaptability to manufacturing purposes is only considered a questiou of time.

The Open Polar Sea Question

Was again epoken of by Professor Davidson, who eaid that he aud M. Pavy had had several conferences on the subject eince the discussion at the last meeting of the Academy. He preeented further evidencee to sustain his pointe in opposition to the the theories of M. Pavy, quoting from numeroue authorities.

Professor Davidson said that in studying up tbe Mint

System of Weighing,

Or what is called "croes-weighing," he fouud that it had been the custom to do it so that there was certain guess work about the reeults which left room for small errors on account of always aesuming the two arms of the levere of the balance to be equal. In investigating the matter he arrived at a way of determining the difference of two weights and the difference in the etatitical moments (length weight) of the heam and weights by cross weighing. He illustrated how it could be done with mathematical accuracy, by an example on the black-board showing the proper way to arrive at very preciee reeults.

Assay of Silver Bars in the East-Indian Mints.

According to the raport of the assayer of the Calcutta Mint, in the East-Indian Mints the silvar hara are aaaayed by determining the ailver as chloride. The cupellation asaay is not corract anough to satisfy the sellers and purchasers; the Guy Lussac assay is notuaed hecause most of the hullion contains quicksilver, laad, and other hase metals; because a previous cupallation aasay is required; bacausa the high tempararture of the climate causes an evaporation of the salt solution; and hecause a large number of persons would ba nacessary on account of the large daily numher of assays.

Under these circumstances, a process introduced hy Dodd, has heen used sinca 1852. By this, the precipitated silver chloride is collected, dried and weighed; 100 parts of chloride containa 75.3 parts of silver. We translate the details of the procesa from the *Berg. u. Hutt Zeitung*:

1. The assay aamples is taken by granulation.

2. The assay is weighed approximately in duplicate hy tha aaaistauts, and then axactly hy the assayers; 18.825 grains (1.22 grammas), corresponding to 25 grains of chlorida ara taken as unity. The weights for the chlorida are marked in thousands, to correapond to fineness. Thus, tha piace actnally weighing 25 graina, is atamped 1000; 10 grains, 400; 0.025 grains, 1; etc.

3. The assay is dissolved in 12-ounce pyramidal-ahaped bottles by means of 1½ drams (2.66 grammas) of nitric acid of 1200 ap. gr. for ailver holding copper only, and of 1320 sp. gr. for impurar bullion. The bottles ara heatad on a sand-bath until the silver commences to dissolva; then 6 oz. cold distilled water are added.

4. Tha chloride is precipitated by adding 1½ drama of hydrochloric acid (1060 sp. gr.) and tha closed bottla ramains quiet for 5 minutes, and then is shaken hy hand 3 or 4 minutes. Then the bottla is nearly filled with water and permitted to stand quiet for 4 hours.

5. The solution is removed by a siphon, nntil only ahout 1 inch remains over tha precipitata; tha bottle is again filled with watar and allowed to remain quiet for two hours. Only with mnch copper is a 3d or 4th washing necessary. The chloride must not stand too long after the second washing, lest it lose in weight, get very finely divided, and stick to the glaaa.

6. Tha flasks are emptied into stone ware crucihlas (1½ in. high), atanding in porcelain saucers, by closing the neck of the hottla with the finger, turning the hottla upsida down, and letting the contents fall into tha crucihle. The bottle is again filled with water, and tha remaining chloride emptied into tha crucihla in a aimilar manner. The lumps of chloride ara pressed in tha crucihle by glasa rods, and the crucihlas decanted.

7. From 10 to 150 crucibles are warmed for an hour in a watar-bath until the chloride aeparates from the sides of the crucible and bakes to a cake. Then they are heated to 150 deg. to 170 deg. C. in an air-hath, until the chloride is well-dried. Tha chloride is weighed while still warm.

8. The length of time required is ahout twenty-four honrs for a few assaya, and three days for a large numher. In the last case the ailver is weighed, dissolved, and precipitated on the firat day, washed on the second, and put in the crucihles, dried and waighed on the third. Generally eighty assays are made daily.

9. Influence of foreign suhstances. Gold remains with the ailver, and is reckoned as such, as in the cupellation assay. Quicksilver has no influence if excess of nitric acid is used, and a strong heat given when dissolving. Lead is removed hy repeated washing of the chloride.

IT is eetimated that China will be a market for American butter and cbeeee to the amount of 5,000 tons annually.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JUNE 4TH.

WATER WHEEL.—Walter Forward, Bettle Creek, Cel.

GANG PLOW.—David A. Manuel, Napa, Cal.

STENCH TRAP.—John Marquie, S. F., Cal.

TRACTION ENGINE.—Oliver A. Olmsted, Sebastopol, Cel.

MODE OF OPERATING ROCK DRILLS.—Ambroee Blatchley, S. F., Cal.

COMPOSITION POST FOR FENCES, TELEGRAPH POLES, ETC.—Johu L. Boone, S. F., Cal.

COMPOSITION RAILROAD TIE.—John L. Boone, S. F., Cal.

BUILDING BLOCK.—John L. Boone, S. F., Cal.

NEEDLE SETTER AND TWEEZER FOR SEWING MACHINES.—John C. Schlarbaum, San Jose, Cal.

REISSUE.

GOVERNOR.—Charlee P. Bowen, Silver City, Idaho Ter.—Patent No. 120,366, deted Oct. 31, 1871.

NOTE.—Copiee of U. S. and Foreign Patente furnished by DEWEY & Co., in the shortest time poeeible (by telegraph or otherwiee) at the lowest ratee. All patent business for Pacific coast inventore tranecacted with greater eecurity and in much leee time than hy any other agency

Notices of Recent Patents.

Among the patente recently obtained through Dewey & Co's SCIENTIFIC PRESS, American and Foreign Patent Agency, the following are worthy of mention:

PRESERVING IRON.—William H. Sterling, New York City, N. Y. Dr. Sterling, although a resident of New York City, hae been for a considerable time etopping in this city. Hie invention contemplates the permanent preeervation of iron. Thie he accomplishes by first heating the iron in vacuo, in order to expand it and open the poree, and then forcing some non-oxidizing or non-oxidizable eubetance into the interstitial and intercellular spacee of tbe iron, and then allowing the iron to cool. Thie thoroughly impregnatee the iron with a eubstance which will prevent it from rusting or deteriorating in any manner. Amongst numerous eubstances which can be ueed with the above result, the inventor especially mentions and etates his preference for paraffine. We regard this as one of the most valuable patente which hae ever been taken out by an inventor on this coast. Englaud has offered a large reward for any procese that will prevent iron from oxidizing, in order that their iron ehipe migbt be rendered proof againet the oxidizing effecte of salt water, which soon destroye their iron plating; and we hope that Dr. Sterling will be the fortunate one to receive it.

MAGNETIC INDICATOR.—Jacob Unna, San Francisco, Cal. This ie quite a novel and exceedingly intereeting arrangement of questions and answere, so arranged, that the device appeare to pereone unacquainted witb ite operation, to be operated by magic. Tbe indicator ie intended as a toy to be used both for amuaement aud instruction, ae it can be made to anewer any number or variety of questione in an entirely magical way. It consiets of a ehallow box provided with a glass cover. Below this cover an index finger ie euepended eo ae to vibrate freely in a circle. The euspenaion of this finger ie hidden by a circular card which covers the center of the cover, and outside of tbie card the glase ie also covered eo as to leave only an annular space tbrough which the motiou of the finger ie visible.

A circular card or disk, which may be provided with questions of geography, mathematics, or of any desired character, around its peripbery is placed upon tbe center card, and is eo constructed that a magnetic attraction will be exercised so ae to cauee the finger to immediately move around and point to the answer to the queetion propounded by tbe card. These answere being arranged on the outside of tbe annular transparent space. The Indicator never answere a question incorrectly, but ie a very interesting teacher, and is capable of teaching many valuable lessone even to old persons. A. Roman & Co., of this city, have purchaeed the entire right conferred by this patent, and will shortly introduce the Magnetic Indicator to the public, when we predict that they will meet with a ready sale.

PERSONAL.—Our friend, Prof. J. A. Whitney, late Editor of the *American Artizan*, New York, hae eatabliehed himeelf in the patent agency business at No 128 Broadway, in that city. Being a mechanical engineer, an expert in patent cases, and a gentleman of much editorial experience, we believe tbat inventors "on the other side" will be fortunate in securing his services whenever tbey need assietance in his profeseional line. Prof. W. is President of the New York Society of Practical Engineering, which eociety'e meetings have frequently been reported in the SCIENTIFIC PRESS. He takes an important part in the weekly discussione of the New York Farmers' Club, and first visited this Coast in 1870, with the delegation of Agricultural editors and ae a member of the committee from tbe Farmers' Club. We wish him the fullest success iu his new undertaking.

Burleigh Rock Drill and Air Compressor.

Since witnessing the effective operation of the Burleigh drill in the Hoosac Tunnel, in 1867, we have repeatedly noticed its performances in other places, anticipating its introduction into some of our large mines on this Coast. We have once illnstrated one form of the machine, bnt are now enabled to give, with other cuts, an engraving of its latest and most improved pattern. The editor of the *Engineering and Mining Journal*, of New York, who has had an opportunity of seeing a number of these machines at work; has given a full descriptive article under this head, and we can do no better than to qnote his language as follows:

The subject of rock drilling by machinery is one of the greatest importance in these days of railroad and canal building, of magnificent tunnels and extensive mining operations.

While the appliances for handling and transporting largo masses of solid rock are many of them of ancient date, the machinery adapted to rock drilling is of very recent origin, though it has already reached a great degree of perfection, as is evidenced by the fact that so many great works are now being prosecuted by the use of pneumatic rock drills.

The Burleigh Patent Pneumatic Rock Drill is a machine designed for tunnelling, mining, quarrying, and sub-marine drilling, which combines the advantages of simplicity of construction, great strength of parts, compactness and lightness, weighing from 200 to 1,000 lbs., according to size, and designed for drilling holes from ¾ to 5 inches in diameter.

It is convenient, easily handled, and not liable to get out of repair, and is in every respect the most practical drilling machine ever invented. It will drill from two to six inches per minute, according to the hardness of the rock. The drill-points used with the machine will make TEN times greater advance at each sharpening than when nsed in the ordinary manner, by hand and sledge. This is proved hy records kept at the Hoosac Tunnel, where these machines have heen in constant use, night snd day, for the last five years. This machine is so constructed that the piston bar is the only part of the machine which receivcs the shock resulting from the hlow upon the rock. This piston har, to which the drill point is directly attached, is made from a solid bar of cast steel. With a pressure of 50 pounds to the sqnare inch, the drill strikes the rock from 250 to 300 blows per minute. The machine is provided with an automatic feed and rotating device, hy means of which the drill is partially rotated at each stroke, and advanced toward the rock as required. The machines vary in size from 38 inches in length, and cross section of 12x6½ inches, to 105 inches in length, and cross section of 15x13 inches, and will feed forward without change of drill-points, from 19 to 54 inches, according to size of machine. By changing drill-points, auy depth required may he drilled. The machine can he operated either hy steam or compressed air. In tunnels and deep shafts the air is preferable, as it serves the douhle purpose of power and ventilation. The compressed air or steam is conveyed to the machine by means of a flexible pipe or tube, which is easily removed when hlasting. The machine will drill equally well at any angle of direction.

Some of the largest works in this country are being prosecuted by these drills; such as the Hoosac Tunnel in Mass., the Nesquehoning in Pa., (just completed,) the Lewis Tunnel in Va.—aud several large tunnels in Colorado. We are informed that several of the hest copper mines in the Lake Superior region do their entire drilling with these machines. The gigantic work of driving 13 tunnels uuder the reef at Hell Gate, New York harbor, which Maj. Gen. Newton is so successfully prosecuting, is heing done largely hy the use of 10 of tbese drills. They are also employed for suh-marine drilling in some of the harhors of the Atlantic and the Lakes.

Fig. I. reproseuts one of the drills mounted on a very simple device, an iron tripod, which answers for surface, shaft and open cut work. For quarries a simple frame on wheels is often used, without any disadvantage.

Fig. I.

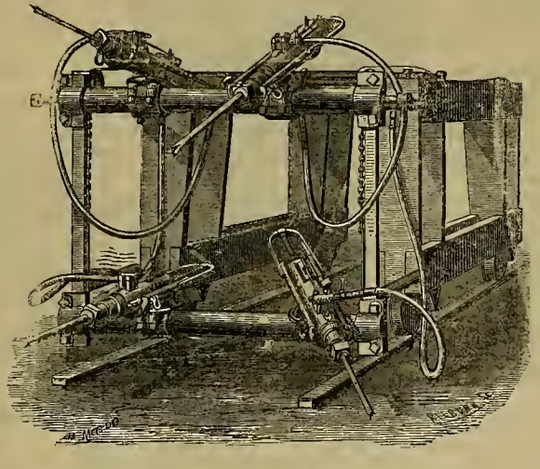
THE BURLEIGH DRILL.

Fig. II. rcpresents the drills as mounted for work at the tunnels at Hell Gate.

This carrisge is constructed of wood and iron, and runs upon iron wheels.

It has jack screws to raise it from the wheels during the drilling, and is held in place by screws running out from the end of the upper har, or from the frame to the roof of the tunnel. A tunnel 8 feet in hight, and from 10 to 16 feet wide, can be constructed hy the usc of this carriage.

Fig. II.



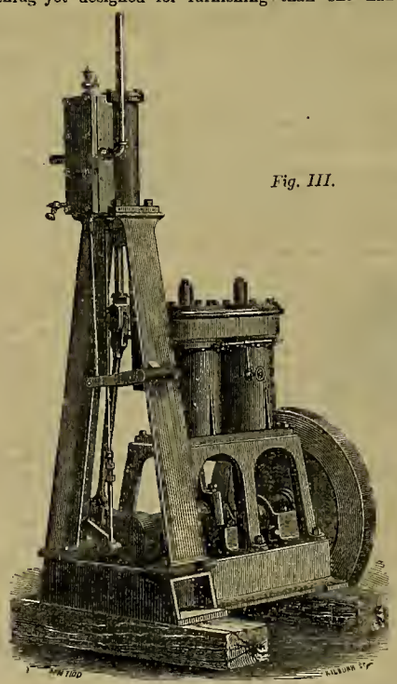
TUNNEL DRILLS.

For smaller drifts a similsr form of carriage is used, consisting of an upright har, standing upon a platform on wheels. Upon this bar a movahle nut and clamp secures the drill and allows of its adjustment to any required position for drilling.

Fig. III. represents the Burleigh Air Compressor used for driving the drills in tunnels, there being five such machines at work at Hell Gate.

It consists of a steam engine connecting by means of a crank shaft with two single-acting air-pumps. It is compactly built, and said to he the hest thiug yet designed for furnishing the "air motor" for the many uses it is now heing put to.

Fig. III.



BURLEIGH AIR COMPRESSOR.

Thirteen (13) of the lsrgest size of these machines are now running night and day to supply the requisite pressure of air in the immense caisson of the New York Bridge Company, now being sunk at Peck Slip, and fifteen (15) of them are at use at Hoosac Tunnel.

The Yellow Jacket Silver Mining Company, at Gold Hill, have recently introduced one of the Burleigh Air Compressors, (second size,) which is giving the most perfect satisfaction. It is running two of the Burleigh Mining Drills in the 1,460 ft. level, with great success. It is also running a No. 3 Knowles Pump at the foo of the slope, and situated 2,000 feet from the Compressor, lifting a two-inch column of water 200 feet vertically. In addition to this, the air exhausted from the machines furnishes the best of ventilation.

It is claimed for this Compressor that it will deliver a much larger quantity of air per minute than any other requiring an equal amount of power to run it.

We understand that several others of the companies on the Comstock Lode are contemplating the employment of these Compressors for hoisting and pumping, as well as driving pneumatic drilling machines.

Parties interested in Rock Drilling hy machinery are referred to our advertising columns for the name and address of the manufacturers, who can douhtless furnish further information.

Mining Accidents.

Thomas Bright, 21 years of age, was killed in the Lloyd claim last week. The San Andreas *Citizen* says he had just run the underground car to the hottom of the shaft to fill the hoisting tuh, and as the tuh ascended the shaft the pin came out of the friction wheel and the tub falling eight or ten feet on his head, killed him instantly.

A miner named Martin was caved on and killed, in the Taylor Hill claims on the East Branch on the 4th inst. The Quincy *National* ssys, that the other men who were with him, on going hack to work after carrying the body to the house, discovered that the whole side of the hill had slid into the cut, and had not the first accident happened the whole company wonld undouhtedly have heen killed. This makes the fourth man killed in these claims this Spring.

A sad accident is recorded in the Mountain *Democrat* of the 15th inst., as having occurred at the Crystal mine nesr Brownsville, El Dorado county, on the 12th inst. In the mine a tunnel entirely perforates the hill or ridge, and the maiu shaft passes through this tunnel, the hoisting whim being on top of the hill, over the tunuel. Miss Edith Richardson aged about 17 years, daughter of the owner of the mine, was visiting it with some of her friends and in going through the tunnel leading the way with a candle, she fell down the shaft, a distance of 170 feet, killing her instantly. She hsd frequently been through the tunnel hut it is prohahle that she came to the shaft sooner than she had expected to.

A man named Welsh was hlown up and killed, at the Spring Valley Mill, on the 8th inst. So says tho Gold Hill *News*.

THE Reno *State Journal*, ssys Mr. Solomon Lingle, mining in the Peavine district, had his leg broken hy a falling rock last week.

A. L. Roltz of El Dorado, Montana, fell from a bank on to the point of a crowhar, and received serious injuries, on the 5th inst.

The Deer Lodge *Independent* says a miner called "Dutch Henry," was severely hurt by a cave on Pilgrim's Bar, on the 5th inst.

By an accident in the Jackson mine, at Eureka Nev., on the 17th, Jos. Holhrook was instantly killed and Jno. Franklin was hadly cut and bruised. In descending the shaft the whim suddenly became inoperativo and they were precipitated rapidly to the bottom, 120 feet. Franklin began to climh the rope and thus saved his life. The other was killed. A shower of rain had wet the pulley, and caused the ropeto slip.

A miner named Thos. Frakes was cousiderahly hruised during the fire at the Amador mine last week. While heing lowered down the shaft, the fire broke out, and the engineer was compelled by the heat to abandon his post. When Frakes was almost half way down the shaft, the ropes ran off the drum, letting the cage fall to the hottom, a dispatch says a distance of 600 feet. He was hadly hut not seriously hurt, hut how he escaped with his life, sfter such a fsll is a miracle. He was the only one hurt during the fire.

L. E. Vowel was caved on and killed in a hydraulic claim on Spruce Bar, Montana, recently.

Frederick Behrman was crushed to death in a cave in Poormans Gulch, about 7 miles from Mokelumme Hill, Calaveras county, on the 7th inst.

DOMESTIC ECONOMY.

Cooking and Health.

The *Health* always and very often the *Life*, especially of invalids and those who have weak and infirm stomachs, depend upon the care and skill of the cook. Our forefatbers were so sensible of this that in days of yore no man of consequence thougbt of making a day's journey without taking his "*magister coquorum*" with him.

In order to acquire health, beauty, strength and spirits, we need nourishing food; and we will further say that we do not acquire those faculties or conditions of the mind and body, because our digestive apparatus gets out of order by reason of the indigestible nature of the food crowded into it. The greater part of the truly nutritive and digestible food is spoiled in the cooking, and so rendered unhealthy.

It is the business of the cook to know wbat is to be cooked and how to cook it—and to do this well it is not necessary to understand anatomy, chemistry, or botauy, auy more than it is necessary to study astronomy to ascertain why the bread comes out heavy, the roast baked to einders or flabbily underdone. Vigilance and precision are tbe indispensible requisites of cooking well.

Recipes for *blanc mange*, custards, etc., and the endless and useless collection of puerile playthiugs for tbe palates, are scrupulously exact, even to a grain in the ingredient, while in substantials everything is done at random. For instance: a bit of this, a handful of that, a pinch of of t'otber, do 'em over with an egg, and a eprinkle of salt, a dust of flour, a shake of pepper, a squeeze of lemon or a dash of vinegar, etc. Seaeon it to the palate (meaning the cook's) in another way of expressing it. The palate may become dull by repeated tastings, and the best way to refresb it is to eat an apple or wash the mouth well in milk. The power of the nervous papillæ of the tongue becomes exhausted and therefore the cook should call in weight and measures so as to preserve the organ of taste for great occasions and new compositions.

It is true that a combination of certain colors is pleasing to the eye, while that of others is disagreeable; so an association of certain savors is pleasing to the taete and grateful to the stomach while others prove disagreeable and cause a revolt in tbe digestive apparatus; thus yellow and violet, green and roee produce an agreeable effect, hut hlue loeee its shade when mixed with green; so sugar is miscible with sweet, sour or hitter food; but not with salt; a proper uuion should therefore he studied. It is likewiso necessary to know that the organs of taste aro distrihuted in different places iu the mouth. *Piquant* food, for example, is felt principally on the sides of the tongue; cinnamon specially stimulates the end of the samo member; tbe ardor of pepper is experienced ahout the middle of the tongue, aud hitter substances affect the base, while spirituous substances seek the palate and the cheeks. The samo may be said of substances sapid in tbe throat and others in the stomach.

Bearing these peculiarities in mind, the cook will be able to form combinations without being monotonous, and accommodate the most difficult taste.

Again, in order that the cook may encourage the macbinery of mastication, food must not only be well cooked but put on the table iu the neatest and most elegant manner. The good opinion of the eye is the first step towards awakening the appetite. Decoration is much more rationally employed in rendering a wholesome, nutritions dish inviting, tban ie the elaborate embellishments whicb are crowded about trifles sucb as custards, cakes, etc. How often do we ece monumental pastry heautiful to the eye but no more digestive than a tombstone, of which it is strikingly suggestive. Better to behold a glorious leg of mutton or roast of heef surrounded with edible ornaments, the demolitiou of which gives joy to the stomach and recreation to the palate—unlike the disagreeable sensations experienced by devouring gypsum pastry fortifications.

Food to be eaten in perfection must be put into the mouth immediately after being cooked —anything *overdone* cannot he meuded; but if a little *underdone*, the stewpan, gridiron or oven even will rectify the mistake. If *overdone* the best juicee of meat are evaporated, and will serve morely to disteud the stomach, and if the sensation of hunger be removed, it will he at the price of an indigestion. The cbief husiuess of eooking heing to render food easy of digestion and to facilitate nutrition, the ouly way to accomplisb it is by plain cookery in perfection—*i. e.* neither *over* nor *underdone*.

How often before diuner is announced and everything in apple-pie order, all becomes lukewarm, and to complete our mortificatiou, the meat is put on a sheet of ice in the shape of a plate, which instantly converts the gravy iuto jelly, and tbe fat iuto a something which puzzles the teeth and the roof of the mouth as if we had bird lime to masticate, requiriug the stomach of an ostrich or a clay eater to digest.

Unless you bave prime provisions you cannot cook well. Be not therefore a *bargain hunter* and trot "around, around, aronnd ahout" a market until trapped into buying somo unchewablo old poultry, tough mutton, stringy cow heef or stale fish at a very little less thau the price of prime and proper food. Many there are, however, wbo with *savings* like these toddle home in triumph, eackling all the way like a goose that bas got ankle deep into good luck. *Ohio Farmer.*

How to Make Hoe-Cakes.—A correepondent of the *Country Gentleman*—says the term "Hoe-Cakes" originated in Virginia, the cakes being baked hy negroes on boes in front of wood fires, the hoes supported hy hricks. Iu Maryland and Rbode Island they are called johnny or journey cakes, and baked on the centre portion of a harrel head, wet previous to baking to prevent sticking to the hoard when turning the cakes; as common wood fires havo become nearly obselete, they may be baked by heing enclosed within an oyster-broiling gridiron, set over fire coals on or outside a stove, avoiding smoke or hlaze. For a single cake, three half piuts *yellow* Indian meal, two eggs, salt to taste, half to a teaspoonful of yeast powder, and a handful of cracklings (refuse of rendered lard) boiled till soft. Lard will do about as well. Work and mix well and to the consisteney of thick paste. Cakes half inch tbick. Serve up on a warm dish, butter generously on the inside.

If any one should think the above is too "rough and ready," try the following: Pour over a quart of Indian meal boiling water, add some lard and a little salt, spread it over a board with a knife, tuck on the bottom of the hoard an iron hoop (ledge) and a handle hehind the board to keep it in position.

Cucumber Salads.—A lady correspondent of *Hearth and Home* says: "We have just prepared our winter's supply of cucumber salad, and this is bow we madc it: There were ahout a dozen ripe "White Spine" cucumbers lying on their vines, and these we picked, washed, pared, cut into strips, taking out the seods, and then to each dozen eucumhers—wbich we cut up into pieces like small dice—we put twelve large white onions, ehopped, six large green peppers, also chopped, one quarter pound each of hlack and white mustard seed, aud a gill of celery seed. These were all mixed together, a teacup of salt added, and they were then hung in a cotton bag to drain twenty-four hours. Then the salad, with enough clear cold vinegar added to cover it, was pnt into stone jars and fastened nearly air tigbt. In six weeks it will be fit for use. It looks as well as it tastes, so white and crisp, and makes an elegant salad for a joint of cold meat. It is not like the Spanish salad, that requires 'a counsellor for salt, a miser for vinegar, a spendthrift for oil, and a madman to stir it up,' but it is quite as good in its way, and not very troublesome to make."

Home-Made Yeast.—Daisy Eyebright, iu the *Country Gentleman*, recommends tbe following: "Boil two handfuls of hops, tied in a small bag, in six quarts of water; slice thin six large potatoes, and boil them with tho bops; when they are soft, skim them out and mash perfectly fine; add to them ono and a balf pints of wheat flour stirred to a smooth hatter with cold water; turn over the whole the boiling hop liquor, first taking out the bag and squeezing it dry; then hang it aside to nse another time, for it will mako two batches of yeast. Stir into this mixturo two tablespoonfuls of sugar, one of ginger and one of salt. When milk-warm, add a teacupful of yeast, set in a warm place to rise, and it will be ready to put into a jug by tho next moruing. Keep in a cool cellar or icebousc, aud it will last good for eix weeks or more. Always shake the jug before using any of its contents. A teacupful of tbis yeast will mako three loaves of bread and a pan of rolls. I shall surely try the recipes of Southern corn meal, which I always uso in preference to the yellow meal.

Oranges.—A writer in tbe Boston *Journal* gives an accouut of winter living in Florida, from which tbis is an extract:—"We get up in the morning and eat a few oranges, by way of preparing an appetite for breakfast. Mrs. M. and L. take theirs in their rooms; I take mine under the trees. After breakfast, which usually consists of fifteen dishes, more or less, oftener more, we go out for a walk. We usually begin under an orange trec; always end there. There are 30,000 of the trees, which accounts for it. At diuner we have oranges again. They constitute the sixtb course, eacb having from one to thirty dishes. If they are not on the table we ask for them. We have never had to ask for them yet. They are both cooked and uncooked, skins both on and off. After diuuer we eat orangee under the trees. I forgot all about lunch. One day I counted eighteen dishes and two negroes; we had orangee, and had them again in the afternoon.".

Graham Bread.—There is but one way only to make Graham bread, viz:—Obtain first-class flour and make it precisely in the same manner as wbeaten bread, with bakers' yeast. It is the most natural and wholesome of all breads. Some people fancy that with the addition of soda, molasses, steaming, etc., it becomes more palatable. This is all bosh; for the manner in which it is generally made renders it by no means healthy or digestible, while *au contraire*, the simpler it is prepared the botter, like all other food. I bave used it according to the above plau for twenty years, only varying from the same when traveling, and then have been compelled, at hotels, to worry down trasb, yclept Graham hread, made out of villainous compouuds and prepared, no doubt, according to some of the "precious" recipes occasionally appearing in various newspapers.— *Moore's Rural.*

The Olive.—There is no more wholesome or palatable oil for cooking than genuinc sweet olive oil. It might well superoede in a great measure the use of hutter and lard. In Italy and other parts of Europe, and cspecially in the East, it is used in eooking to the exclusion of almost everything else of this nature. The fruit, too, is coming into more general use in the different modes of pickling. Tbe taste for olives is usually not a natural one, but when formed it becomes very decided, and the fruit is perhaps the most wholesome pickle that can be used.

Egg Plants, or Vegetable Eggs—Are used in tbeir green state—that is, while the seeds are soft aud white. Tbey will do as soon as they are large enough; but economy suggests that they be full size hefore pulliug. Pare off the outside rind, cut arouud in slices one-quarter of an incb in thickness. Have on a dish equal portions of salt and pepper, wbich must he rubbed with the fingers on to each side of the slices; then roll in flour and fry ou a buttered griddle. When brown on hoth sides they will be soft and ready to eat while hot. They make a nice breakfast dish, and are a substitute for meat.—*Moore's Rural.*

To Clean Lamp Chimneys.—When you wisb to clean a lamp ehimney, hold a linen cloth against one end of the chimney and place the other end in your moutb; breatbe in it until it is covered inside with moisture, push the cloth into the chimney with a smooth slender stick, and rub it around until the moisture is ahsorbed; repeat the process and breathe over the outer surface also; rub tbis with a cloth until dry, and you have a clean, bright chimney. Soft newspaper will take the placo of a linen cloth. Do uot use cotton clotb on any glassware.

To Boil Eggs.—Who does not know how? Yet how few people know the way to boil them iu order to retain all their delicious flavor. Allow me to tell you my method:—I put one half dozen eggs into a tin pail, and pour about two quarts of boiling water overtbem; then set the pail on the heartb, where the heat is not kept up, and let them remain for six or ten minutes, according as we like them cooked, bard or rare. By eo cooking the white is always tender and delicioue. Try it.

Selected Recipes.

Salad Dressing.—Take the yolk of oue fresb egg and mix witb it two tablespoonfule of olive oil very slowly, add one and one-half spoonfuls of mustard, three spoonfuls of salt, a little pepper, and last of all two epoonfuls of viuegar. Boat the white of the egg to a stiff froth, and lightly stir in.

Apple Float.—One pint of stewed apples; when cold sweeten and flavor to taste. Just as you want to send to table, and the beaten whitee of four egge, lightly stirred into it. With cream this makes a nice dessert.

Apples stewed for sauce should be pared, cored and put into cold water until they are ready to be cooked, to keep them from discoloring. Add a little water, puttiug them in a porcelain kettle or stew-pan. Cover them, and let them cook gently.

Very Fine Doughnuts.—Half a teacup of hutter or lard, 1 teacup of sugar, 1 teacup of sweet milk, 4 eggs, 1 teaspoonful of extract of lemon, or allspice and cloves if proferred, saleratus and cream of tartar.

English Buns.—One pound of flour, ¼ pound of sugar, some cinnamon, ½ pint of rising; rub them all togetber, and mix them with milk, four or five drops of pearlash. Wash them after they are baked with sugar and water.

Spanish Buns.—One and one-quartor pounds of flour, ½ pound of butter, ½ pound of sugar 4 eggs, 1 glass of brandy, wine and rose water mixed, some currants and a ¼ pin of rieing. Rub tbe flour, butter, sugar and ciunamon well together, then add the other ingredients, beat all well together, and stir in enough milk to make it a proper batter. Bake them in tins.

Jelly from Gelatine.—One ounce and a half of gelatine put over nigbt into a pint of cold water, with tbe rinds and juice of three lemons. Next morning add a pint of hoiliug water, half a pint of sherry, the whites and shells of three eggs, and sweeten to your taste. Boil the whole ten minutes, and strain through a jelly-bag. This will make a quart of jelly. Bo sure not to stir tho mixture after it is placed on the fire. It is excellent.

Milk or Cream Gravy.—One quart milk, 3 tablespoonfuls corn starcb, made into a smooth batter with rich milk or cream. Boil the milk and pour in the batter, stirring all the wbile. Let it boil two or three minutes, remove from the fire, and stir in immediately a well-beaten egg. This dressing is used for haked potatoes.

Excellent Crackers.—To fourteen cups of flour, add one cup of lard, two teaspoonfnls of soda, four of cream tartar. Rub the ingredients well into flour, then add three cups of water, work thoroughly and bake quick.

Cement for Aquarium—The trouble with red lead and oil is that it is apt not always to adhere to the glass. Probably tho beet cement is that which consists of three parts of powdered pipe-clay, one part oxide of iron, and as much linseed varnish as is sufficient to make a stiff paste; or the so-called stone cement—nine parts of pipe-clay, one of litharge, and so much lineeed oil as to be of the proper cousistency. This becomee as bard as iron, and adheres with great tenacity to glass or almost any other substance.

THE TANITE COMPANY,

STROUDSBURG, PA.,

Sole Manufacturers of

THE TANITE EMERY WHEEL,

And builders of Emery Grinders, Saw Gummers, Etc., Etc.

Emery Grinding Machines,

At $15, $30, $50, $75, and $110. DIAMOND TURNING TOOLS, $15 each.

SOLID EMERY WHEELS,

From 40 cents to $113 each.

Every IRON FOUNDER can save money by using these Wheels to grind the sprues and gates off of eastings. Every MACHINIST can save money, files, and labor, by using them to shape his lathe tools, to grind off cbilled edges, to finisb nuts, etc., etc. Every BRASS WORKER can use tbem on Brass. Every WOOD WORKER can nse tbem to gum his saws, to sharpen his planer knives, to make bis moulding cutters. For illustrated circulars address The Tanite Co., Stroudsburg, Monroe county, Pa.

THE FREAR STONE COMPANY

OF CALIFORNIA.

Office, 638 Market Street.

OFFICERS:

James Gamble, President. | L. A. Booth, Treasurer.

EXECUTIVE COMMITTEE:

N. W. Spaulding. George C. Potter, N. P. Perine.

This Company will contract to furnish or put up the heaviest, strongest and most elaborate and elegant Fireproof Stone Fronts, of any design, and every style of Plain and Ornamental Door and Window Caps, Keystones, Sills, Water Tables, Coping Ashlars, Plain and Ornamental Stone Work of every description. Fireproof Buildings and Bank Vaults, Cemetery Work, Curbing Stones, Fountains, etc., all at prices far below native cut stone, and equal, in all respects, as to strength and durability.

Architects and Builders, before letting their contracts for Stone Work, are requested to call at the office of this Company, and examine certificates, specimens and photographs of buildings already constructed of Frear Stone in Chicago and other Eastern cities.

For further information apply to N. P. PERINE, 638 Market street. [19v24-3m

Hydraulic Miners, Attention!
LITTLE GIANT.

If you wish to keep up with the times, buy a LITTLE GIANT or a DICTATOR. These are fully protected by Letters Patent, and infringe on no others.
Manufactured of any size to suit. Are in use under all pressures, from 445 feet down.
WILL DISCHARGE FULLY TEN PER CENT. MORE WATER than any other, under the same circumstances.
An injunction from the U. S. District Court is now in force against HYDRAULIC CHIEF, and parties using the same will be duly prosecuted.
I fully guarantee my customers against all damages for alleged infringement.
Send for Particulars and Testimonials
To WILLIAMSON & CORY, Marysville; J. H. NASH, Placerville; F. SMITH, at Locke & Montague's (San Francisco Agents); or to
R. HOSKIN, Dutch Flat, Cal.,
Sole Licensee and Manufacturer, under Allenwood's, Masey's, Rice's, Craig's, and Hoskin's Patents.

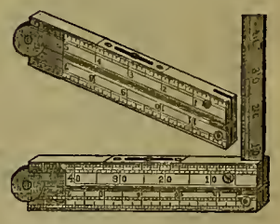
STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.


ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of one of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price by mail, prepaid, $4. For agents' terms, address

An Inventor Going Eastward.

Mr. George Pardy, of this city, well known as a Mechanical Engineer and Draughtsman, and late Secretary of the Mechanics' Institute, has given up his practice as Engineer and Patent Solicitor, and gone to the Eastern States to introduce his patented system for detecting spurious holders of non-transferable admission tickets to various kinds of audiences and entertainments.

His system of making characters upon the face of tickets when sold, indicating the age, hight, complexion, hair, whiskers, etc., of the purchaser, is a very simple one, and so conveniently efficient, that some $5,000 or more was saved to the Mechanics' Institute of this city, by its use in one season. Over $2,500 it is conceded, was saved by the use of Mr. Pardy's patent tickets at the last State Fair. Believing that its use in other States will be similarly useful, we hope Mr. Pardy will be successful in introducing his invention in the East.

We have received the following note from Mr. Pardy, just before leaving, on Monday last, with the request that we should state that his address, for the present, will be at Harrisburg, Pa.

San Francisco, June 17th, 1872.

Messrs. Dewey & Co., *Gentlemen*:—I have to thank you for kindly consenting to adjust what Patent business may remain unfinished in my hands, at date of my departure for the East. I would also take this occasion to refer my late clients to your firm, as able and trustworthy solicitors, fully prepared to prosecute Patent applications, both here and in Europe.

Very truly yours, George Pardy.

Fires.—A fire started at 2 o'clock A. M. on the 13th inst. in the storehouse of the Amador Mining Co., Sutter Creek, which totally destroyed the storehouse, timber house, blacksmith shop and hoisting works over both the north and middle shafts, and thence into the mine by the north shaft, the same which was burned out by the fire two years since. For a short time it was thought that the fire would get into the lower workings but by well directed efforts it was extinguished. The Superintendent, Mr. Steinberger had all the entrances to the mine closed, after the men had come ont of the south shaft, and the fire was checked, only one man was hurt and he not seriously. The machinery and hoisting apparatus was all comparatively new; preparations have already been made to have the mine in running order again immediately. The Amador *Dispatch* roughly estimates the loss at not less than $100,000. It is not known at the present writing how badly the shaft ie injured. The fire is said to have been caused by some one going into the store room with a lighted candle and letting it accidently come in contact with a Giant Powder box.

A fire broke out on the night of the 16th inst. in King's Hotel, Mineral Hill, Nevada, by which nearly all the business portion of the town was destroyed. The loss was quite heavy.

The Paul Process.—We call the attention of quartz miners to the statement, in our advertising columns, of the Snperintendent of the Calaveras Mining Co., respecting his test of the Paul Process. The result is reliable, and really remarkable. In the face of such certificates as Mr. Paul has from time to time presented to the readers of the Press, we can scarcely doubt the declarations of Panl's ability to increase the yield of our California gold mines from 50 to 100 per cent.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Baltic S. M. Co.—June 13. Location: Ely District, Nevada. Capital Stock, $2,000,000, in 20,000 shares. Trustees—P. J. White, John C Ballinger, G. Atkinson, Douglas W. Davies, and Stephen G. Worden.

Victoria and Imperial Tunnel and M. Co.—June 13. Location: Little Cottonwood District, Utah. Capital Stock, $3,000,000, in 30,000 shares. Trustees—Charles A. Washburn, S. A. Raymond, S. A. Coburn, Jos. B. Bidleman, and H. G. Livermore.

San Francisco Tunnel and M. Co.—Juue 17. Location: Enreka District, Nevada. Capital stock $500,000, in 50,000 shares. Trustees—Homer S. King, Henry Epstein and S. Heydenfeldt.

McMahon S. M. Co.—June 18: Schell Creek District, Nev. Capital stock, $3,000,000, in 30,000 shares. Trnstees—O. F. Griffin, G. T. Lawton, Coll. Deane, F. R. Hayes and J. H. H. Williams.

Increase of Capital Stock.

The Tecumeeh G. and S. M. Co. have filed a certificate of increase of Capital Stock from $153,500, in 614 shares to $3,000,000 in $30,000 shares.

Julia G. and S. M. Co. filed a certificate of increase of Capital Stock on the 17th from $1,000,000, in 10,000 sharee to $3,000,000 in 30,000 shares.

The Adriatic G. and S. M. Co., also filed a certificate of increase of Capital Stock on the eame day, to $2,700,000 in 27,000 shares.

Meetings and Elections.

The Ohio Consolidated Mining Company have elected as Trustees, W. G. Wayman, (President), J. J. Birge, Benjamin Dore, D. McDonald and A. Bateman; W. A. Knapp was elected Secretary.

The Independeut Coal Mining Co. met on the 17th inst. and elected the following Trustees for the ensuing year: A. Block, S. Steinert, H. Levy, H. Epstein and E. L. Goldstein.

The Victoria and Imperial Mining Co. Trustees have elected the following as officers: C. A. Washburn, President; J. B. Bidleman, Vice-President; Wm. H. Watson, Secretary and Treasurer, S. A. Coburn Superintendent.

The City Railroad Company have elected the following Directors: R. B. Woodward (President and Treasnrer), A. J. Glading (Vice-President), M. P. Jones, Jos. H. Moore, Isaac Hyde, E. Dewitt (Snperintendent) and Richard Kent, M. E. Willis wae elected Secretary.

The Alpha Consolidated Mining Company have elected the following Trustees: J. D. Fry, W. M. Lent, L. Gerstle, H. C. Kibbe and A. K. P. Harmon.

The Hidden Treasnre Consolidated Mining Company have elected as Trusteee, S. Linkton, B. F. Sherwood, F. G. Smith. J. K, S. Latham and M. C. Hillyer.

The Silver Wave Mining Company have elected the following Trustees: J. E. Perkins (President), S. B. Boswell, L. A. Booth, Thos. Flint and W. P. Prichard; J. W. Clark wae chosen Secretary.

Mining Discoveries.—Rich silver mines are reported as having been discovered in the madison Range, on the ridge between Elk and Cherry Creek, Montana. Some of the ore has assayed abont $225 per ton.

The Santa Fé *Post* records the discovery of extensive deposits of coal on the pre-emption lands of Rencher & Co., iu the vicinity of Galisteo, about 20 miles from Sant Fé. It is a bituminous coal, very free from enlphur, aud has been sufficiently tested for house and blacksmith purposes, to prove it of excellent quality for both these purposes.

A large and promising vein of yellow sulphuret and carbonate of copper ore has recently been discovered about 5 miles from Cañon City, Colorado.

Croppings of bituminuous coal are reported as having been found along the shore of the Golden Gate, between Point Bonita and Lime Point.

Another ledge of cinnabar ore has been found in Sonoma Co., Cal., about four miles from the Geyeers, in the same range of mountains in which the Knox aud Redington mine, in Napa Co., is located. Prospecting is "lively" in that locality.

Mining Sales.—A dispatch dated, Eureka, June 17th, says, that another heavy mining eale to English capitalists has just been made. The Bullwhacker, Dunderberg, Lord Byron, El Dorado, and Tecoma, are among the mines purchased. Extensive reduction works are to be erected by the company. A private letter from D. Andrews, Postmaster at Buel, Elko Co., Nev., informs us that the Tecoma, mentioned above, has been sold to W. H. Aspinwall, and others of New York, for $150,000. We presume he refers to the same sale.

The Quincy *National* says, that Thos. Robson has sold a one-sixteenth interest in the Buckeye claim for $2,500.

A Worthless Patent Made Good.

Washington City Branch of
Dewey & Co.'s "Scientific Press" Patent Agency.
Washington, D. C., May 28, 1872.

Messrs Dewey & Co.—*Gentlemen*:—We are particularly pleased to announce our success, to-day, with John E. Ball's reissue "Elevator." We went over the case carefully, with the Examiner; and the result of the interview was, the case passed for issue without altering a word. By devoting a half hour's time to this case, and arguing the points involved with the Examiner, we have converted what was a worthless patent into a valnable one. We congratulate our client. Yours truly,

A. H. & R. K. Evans.

We are constantly succeeding with cases like the above, originally issued through other agencies, or takers out by experienced inventors themselves.

BURLEIGH

ROCK DRILLS

AND

AIR COMPRESSORS.

The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being applied.

H & L AXLE GREASE.

TRADE MARK H&L

Avoid Imitations

The attention of Teamsters, Contractors and others, is called to this very superior AXLE GREASE manufactured by

HUCKS & LAMBERT.

The experience of over twenty years, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to reduce the friction on axles, and thus

Relieve the Draft of the Team,

Far beyond the reach of any who have but recently gone into the business; and as the H & L AXLE GREASE can be obtained by consumers at as

LOW A RATE

As any of the inferior compounds now being forced upon the market by unprincipled imitators, who deceive and defraud the consumer.

HUCKS & LAMBERT

Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such general satisfaction, to ask for the H & L AXLE GREASE. See that the trade mark H & L is on the red cover of the package, and take no other.

"Clear as Crystal."

PEBBLES ARE MADE from Rock Crystal cut in slices and ground convex, concave or periscopic, for Spectacles. In Europe and in the Eastern States they are superceding glass.

Among the advantages they have over glass are, that being susceptible of the HIGHEST POLISH, they transmit more rays of light, nothing having more transparency.

They are COOLER to the Eyes—a very important gain.

They are much harder than glass, and DO NOT SCRATCH.

The best quality of Crystal is found in Scotland and the Brazils, and is manufactured into lenses by the best workmen in England and France, for

Thomas Houseworth & Co.,

OPTICIANS,

No. 9 Montgomery street, Lick House,

Where they can be obtained, already fitted, in frames, or may be fitted to order.

Persons sending their Spectacles can have Pebbles inserted of the same grade as their glasses.

Illustrated Circular for styls of frames sent to any address free.

☞ Pebbles sold as such by us, are Warranted.

ANOTHER MILL.

The Paul Process

UNRIVALLED!

A Square, Practical Test.

The Process more than Doubles the Yield!

$58.44 per ton by the Paul Process;

$23.33 per ton by the old way.

YIELD IN GROSS:

$1,139.70—from 19½ Tons by Paul Procees.
420.21—from 18 Tone by Old Way.

If 20 Tons can be Worked, why cannot 20,000 Tons?

The long sought-for Secret discovered and secured by Five Letters Patent.

Read the following:

CALAVERAS GOLN MINE, Washington Mining District, Calaveras County, California, June 13, 1872.

ALMARIN B. PAUL:—Dear Sir: The result of working 19½ tone of our ore by your Process wae at the rate of $58.44 per ton. A eimilar quantity of same ore, worked by the wet battery, ae a teet, gave only at the rate of $23.33 per ton.

I will here add that I entertain no doubt of your Procees saving *at least* 50 per cent. *more* than hattery working on *any ore*, and in sulphureted ores a much higher percentage. Yours reepectfully,

WM. M. DONNELL,
Superintendent Calaveras Gold Mining Co.

THE PAUL PROCESS,—Ae long ae ores have heen worked, a great lose, it ie admitted, still occurs in the present mode of reduction; and if Mr. Paul has fonnd the philoeopher's stone for saving it—and it really looke as though he had—it will open a bright future for the Pacific Statee, and inaugurate a new era in mining throughout the world. Not only is the Procese new, but most of the machinery adapted to it invented and patented by Mr. Paul. The Process poeseeeee the remarkable quality of being adapted to hoth silver and gold; it ie eaid to be lese expensive than pan working, and but a trifle more expeneive than our present system, as used in California.—*S. F. Chronicle.*

TO THE MINING INTEREST.

I offer my services to the mining community for the overcoming, by my Procese, of all difficultiee connected with the amalgamation of a high percentage of the precione metals from milling ores, and assert my ability to increaee the yield of California gold mills from 50 to 100 per cent. above that now obtained by Battery, Copper-plate and Blanket working—the finer the gold, the higher the per cent. produced—and in pan working on eilver ores (nnroasted) from 20 to 200 per cent., according to combination of metals, and in no case have bullion less than 950 fine.

The Procees and machinery is plain and practical, and appeale to the common sense of experienced miners.

I offer it at reasonable pricee, having a desire to make it a public henefit, ae well ae an individual one. Pamphlets can be had, free of expense, on receipt of addrese, or application to

Endless Chain Elevator,

FOR RAISING WATER FROM WELLS.

BALL & CRARY, Patenteee.

The inventor claims that bie ELEVATOR excele any other apparatus that has ever been brought before the public for the purpose of raising water from welle. Its chief merits are: First—The water is obtained from the well in a purer and colder state, for the reason that it is drawn from near the bottom. Second—It ie operated with the least difficulty, particularly in lifting a certain amount of water from any depth in a given time, as compared with any other mode. Third—It obviates all necessity for going down into the well in putting in the machinery, or for repairing the same, as auch labor can be performed at the surface. Fourth—It can be easily taken out of one well and transferred to another. Fifth—It is less liable to get out of repair—but when repairs are necessary they can be easily made by any one; the action made by the Endless Chain and buckets keepe the well properly ventilated; there is no possibility for the person operating it [nor for a child] to fall into the well.

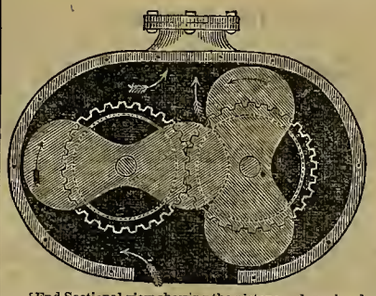
ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

GLOBE IRON WORKS,

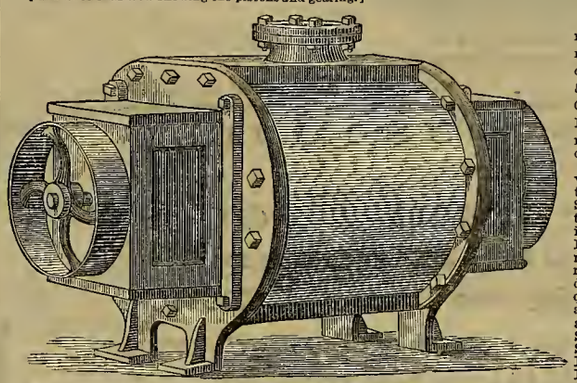
Stockton, Cal.



[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

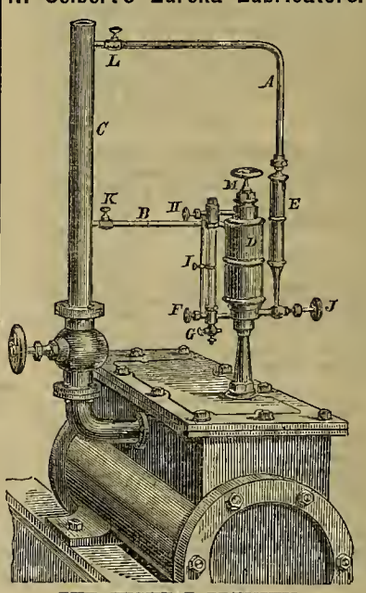
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

PACIFIC BRIDGE COMPANY,

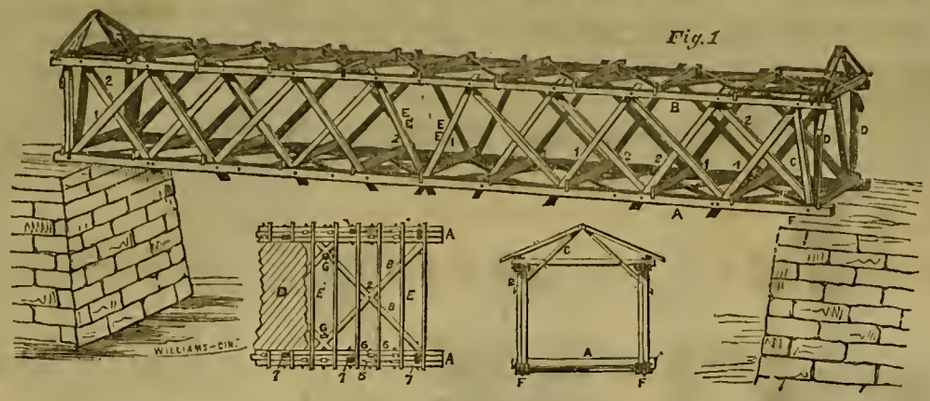


Fig. 1

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.

The timber used is placed so directly in the line of strain, that less material is required to support the same load.

It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.

Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

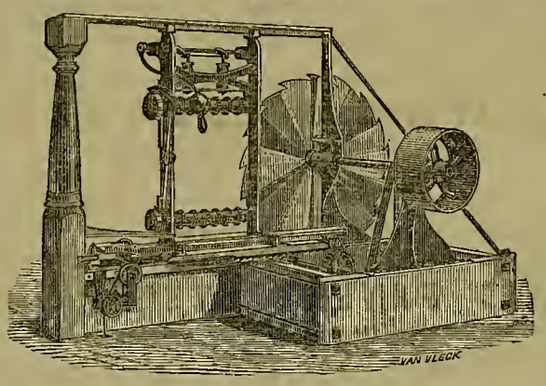
Huntington's Improved Shingle Machine.

PATENTED DECEMBER 7, 1870.

MANUFACTURED AND FOR SALE BY
F. A. HUNTINGTON,
Nos. 18 and 20 Fremont Street, SAN FRANCISCO.



FOR SIMPLICITY, DURABILITY AND RAPIDITY OF action, these Machines have no equal, cutting from 3,500 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

These Machines are in use at the Mills owned by the following parties: Macpherson & Wetherbee, San Francisco; Popo & Talbot, San Francisco; Hanson & Co., Redwood City; Rico & Haliburton, Woodside; S. P. Pharis, Woodside; Harrington & Co., Pescadero; Burch & Co., Pescadero; A. Saunders, Point Arena.

Steam Engines, Sawmills, Planing, Lath and Picket Machines, etc., made to order, at short notice.

3v24-1am-6m **F. A. HUNTINGTON**, 18 and 20 Fremont street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.

Office, 315 California street. A. J. SEVERANCE, CHAS. H. RANDALL, J. GUS. BURT.

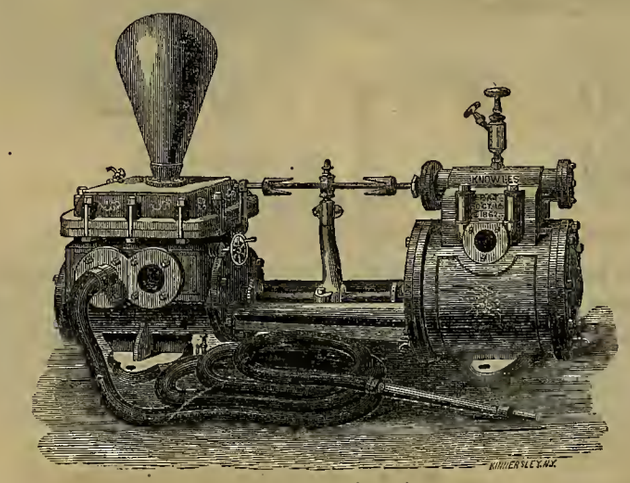
Extract from Official Report of Mechanics' Institute Fair of San Francisco, 1871.

"In the foregoing trials it appears that the most efficient Pump on exhibition is the KNOWLES. The workmanship on this Pump is also very good. We would therefore recommend that this Pump receive a Silver Medal. (Diploma awarded). Signed by the Committee:

G. W. DICKIE, H. B. ANGELL,
v113-awbp CHAS. R. STEIGER, W. EPPELSHEIMER, MELVILLE ATWOOD."



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

WE BUILD AND HAVE CONSTANTLY ON HAND
THE LARGEST STOCK OF PUMPS IN THE WORLD,
And for Every Conceivable Purpose.
A. L. FISH, Agent.
No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

BLAKE'S PATENT STEAM PUMP.

From the Report of the Committee on Steam Pumps, at the Seventh Industrial Exhibition of the Mechanics' Institute, San Francisco.

BLAKE'S STEAM PUMP.—This Pump yielded the best results as to the quantity of water discharged as compared with its measured capacity. The valves are of brass, and well arranged. The steam valves are well arranged for operating the pumps, either fast or slow.

We recommend that a Medal be awarded to it, as THE BEST STEAM PUMP. [Awarded a SILVER MEDAL, the first premium.] (Signed) JAS. SPIERS, WM. H. BIRCH.

From the Report of the Committee on Steam Pumps, at the Eighth (or *last*) Industrial Exhibition of the Mechanics' Institute, San Francisco:

BLAKE'S MINING PUMP.—Thie is an excellent Pump, well made, end givee a high per cent. of duty. We recommend a Diploma for this Pump. (Signed by the Committee.)
G. W. DICKIE, H. B. ANGEL, OHAS. R. STEIGER,
W. EPPELSHEIMER, MELVILLE ATWOOD.

[No other Steam Pump received other than a Diploma or honorable mention et the LAST Mechanics' Exhibition, *all other assertions to the contrary notwithstanding.* Hooker's Hand Pump wes the *only* Pump of any kind whatsoever, that received a MEDAL and FIRST PREMIUM (highest award to pumps) at the *last* Exhibition, for which we are also selling agents.—*See official Report of the above Committee.*]

The triel of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a committee of five of the most thoroughly practical mechanics on this coast (as above named), showed that the Blake Pump gave 86 per cent. of utilized power, while others gave but 60 per cent., showing great difference in economy.

The Blake Pump is the ONLY Steam Pump that EVER RECEIVED A SILVER MEDAL at any Exhibition of the Mechanics' Institute ever held in San Francisco or California

☞ A complete stock of all sizes constantly on hand at the Mechinery Warehouse of the Agents,
TREADWELL & CO.,
Market Street, corner of Fremont, SAN FRANCISCO.

THE TRUTH!

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a *First Premium* and Diploma, awarded to the Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JUNE 29, 1872.

VOLUME XXIV. Number 26.

The Mint Bid.

Some four or five months ago, the Superintendent of the new U. S. Mint building, uow being constructed iu this city, issued propoeals for the wrought and cast iron work for that structure. In answer to said proposal, five bide were put in by different parties in this city, in addition to a number from the Atlantic Statea. Two of the San Francisco bids were lower than the lowest Eastern bids. After an unusual dclay of about three months from the tiue these bids were received at Washington, the lowest San Francisco bid—that of the Occidental Foundry was accepted, with the proviso that the chimney should be put in place within thirty daya from the dste of the contract, and that, too, when no *time* wae specified in the proposale, the bids being all made on reasonable time for completion of the work.

This new condition of thirty daye was considered an unreasonable demand, and one which could not be met under the terms of the bid; hence the bidders refueed to eign the contract.

After some little delay, proposale were re-advertised, under which three bids from thia city were again put in on the 17th of June, at the Superintendent's office in this city, in accordance with the terms of the advertisement, (the bids to be forwarded from this city to Washington for approval.) On Wednesday, only two days afterward, telegraphic advices were received here, that *the contract had been let at the East!*

The above, we believe, are the simple facts in the case. Now, if it wae necessary to insist upon the thirty days for the construction of the chimney, as per the first bid, instead of perhaps fifty or sixty days, which would have been a reasonable time, how could the Department have bettered itself by taking the time to readvertise for new proposals, and then let the contract to parties in the East, who would require about thirty days for the transportation of the chimneys to this coast, after they were ready for delivery at the Eastern foundry? The San Francieco parties, uuder the first bid could have had the chimney in place before it could have been possible for the accepted bidders at the East to have got them ready for shipment. Again, how is it possible that any Eastern bidder could comply with a 30 days' condition, eepecially after the delay for readvertising, when more than half that time would be required for transportation, even if sent by rail, an unnsual mode of trausporting such heavy freight?

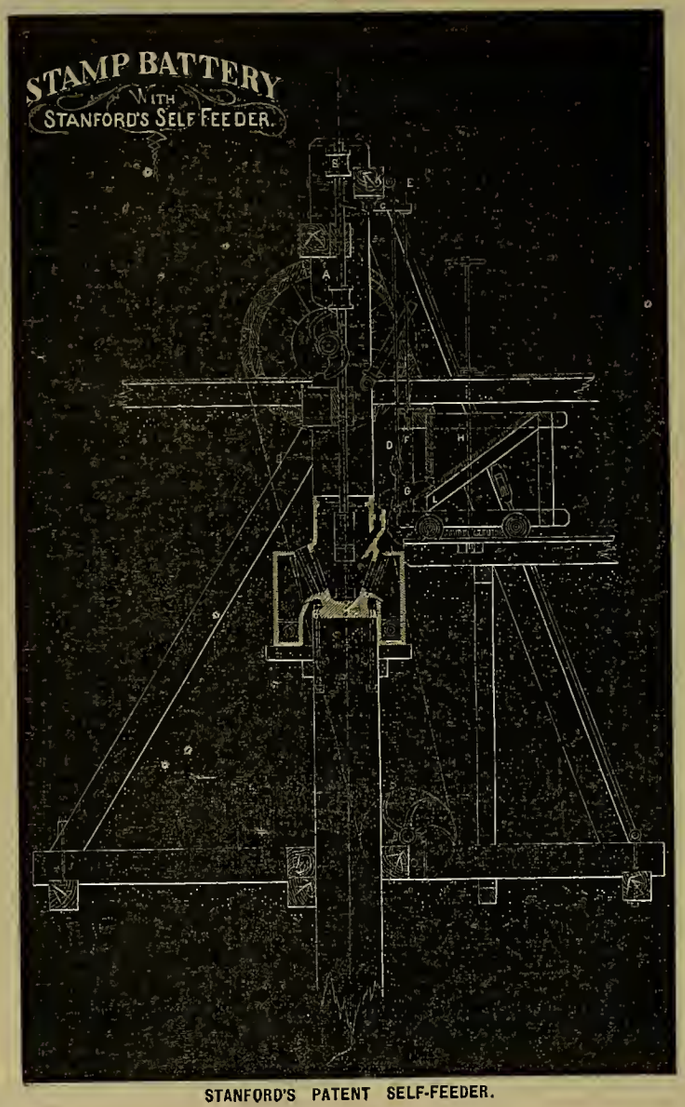
The mechanics of San Francisco ask no favors over their Eastern brethren; but the circumstances connected with this contract would eeem to indicate that there has been discrimination somewhere, the evidence of which is too palpable to be overlooked.

DIVIDENDS AND ASSESSMENTS.—The eum of $882,000 was paid out ae dividends this month by four companies, viz: Belcher, $312,000; Crown Point, $300,000; Meadow Valley, $60,000; Raymond & Ely, $210,000. Assessments levied during the same time, by 15 different companies, amounted in the aggregate, to $220,850. The difference in favor of stockholders, is $661,150. The Crown Point dividend fell off from last month, $181,000; and the Yule Gravel Company omitted their usual dividend; so this month the product ie a little lees.

JULIAN DISTRICT.—The bullion ehipments from this promising mining district, in the Cuyamaca Mountains, San Diego county, were $13,151 last week.

Stanford's Patent Self Feeder.

Thie convenient and ueeful device is the invention of Mr. C. P. Stanford, and is intended for the purpose of keepiug the mortars of stamp batteriee supplied with rock automatically. It is said to do its work thoroughly and in a very satisfactory manner, and the simplicity of construction ineures steady work without its being liable to get out of order. The principle upon which the apparatus works is simple; as the stamp crushes the rock, which passes from under it through the sieves, it drope below a certain point, giving a jar to the shoe of a hopper-car, causing the discharge of a quantity of rock into the mortar. The manner of operation will be seen by reference to the accompanying engraving, from plans and working drawinge of H. J. Booth & Co., Union Iron Works, in this city.



STANFORD'S PATENT SELF-FEEDER.

In the cut, *A* repreeents the stamp etem, tu which is keyed a feeding tappet *B*. This tappet is set on the stem so that when the rock in the mortar hae been reduced to a certain depth, it shall strike on one end of the lever *C*, as the stamp falle.

Thie lever is hung from the girt *K*, and is forked so that it spans the stamp stem. The rod *E*, paases up through a hole in the ontsidc end of the lever, and has a collar bearing against the lever to support it. The hight of this collar is regulated by a screw and check nuts *F*, on the lower end of the rod *E*. A rod *D*, with a hook at each end, hooke into a notch in the lever *C*, and aleo hooks into the bail of the shoe *G*, of the hopper-car, *H*. The shoe *G*, is hinged at *L*. The hopper-car is lined with sheet-iron and has four wheels, so that when the battery is to be run without the eelf-feeder, it can be run back out of the way.

The operation of the apparatue is as follows: The feeding tappet *B*, having been clamped on the stem at the proper place, and the lever having been regulated to its proper poeition for the dietances apart at which the ehoe and die are to work by reason of the intervening rock, the hopper-car is filled with rock. The mortar has been fed by hand so as to make a bed under the stampe. As soon as the rook under the middle etamp, to which the feeding tappet is attached, decreases in depth below the fixed limit, the feeding tappet, in its descent, strikee against the lever *C*, and through the rod *D*, jars the shoe *G*, caueing it to throw a quantity of rock into the mortar. This continues, until the rock has become ec thick under the stamp that the feeding tappet does not touch the lever. Feeding is then stopped, to begin again when the rock has been crnshed from under the stamp. The feed is adjusted tc the wear of the ehoes and diee by the screw *F*, and by moving the feeding tappet *B*, in the stem.

This is a California invention, and dces away entirely with a man for "feeder," and can be regulated so as to keep just euough rock under the etamp to prevent it either choking or getting on the die. Booth & Co. have put this self-feeder in the International Mill, 60 stamps; the Stanford Mill, 30 stamps; the Pinto Mill, 20 stamps; the Mineral Hill, 20 stampe; and the Monitor aud Northwesteru Mill, 10 stamps. It is also being used at the Rock Point and Birdsall's Mills, at Dayton, Nev.; Angel's Mill, at Angels; the Calaveras Miuiug Company'e Mill; the Amador Mill, and other prominent mills throughout the coast.

ARIZONA ORES.—The shipments of orcs from Wallapai, Prescott and Clark Districts in Arzona Territory, are increasing every month, and some of the finest class of ore has arrived in this city from those localities, within the past few weeks. Mr. J. W. Thurmau, who sampled these ores, informs us that they average fron $300 to $2,500 per ton. As soon ae they get steamers on the Colorado River, which will bring up all the ore that is now accumulating on the dumps of the different mines, we may expect large shipments of ore monthly. The miners in that eectiou of country deserve great praise for their energy and perseverance, and it is to be hoped that the day is not far distaut when they will be amply rewarded for their time and labor. All they want now is a railroad, iusuring cheap and quick trnsportation, ae the above mentioued districts have a large amount of good ores lying at the different mines, which would pay the owuere handsomely if they could get them to San Francisco ou reasonable terms.

POWDER WORKS EXPLOSION.—The Hercules Powder Works, owued by the California Powder Co., and located near the Eastern extremity of the new Park, and lece than three miles from the heart of the city, exploded with a terrible report, about six o'clock on Friday 21st inst. The employés had fortunately left the works bnt a short time previous, so that no one was injured. The loes of powder, etc., was eome four or five thoueand dollars.

The Hercules powder is a mixture of rifle powder and nitro-glycerine. The nitro-glycerine wae made upon the ground, and the rifle powder at the Company's powder works.

The supposed cause of the accident was the bureting and inflammation of a carboy of acid, occasioned no doubt, by the excessive heat of the day. The explosion wae heard throughout a radius of twelve or fifteen miles in every direction. The concussion was very severe in the city.

THE NARROW GAUGE RAILROAD CONVENTION met in St. Louis on the 19th inst., to discuss the question of railroad gaugee. Some of the moet prominent railroad men in the United States were present, and the result of their proceedings will be looked to with intereet. A resolution was adopted which provides for a central committee of thirteen.

CORRESPONDENCE.

Schell Creek Mines.

[By our Mining Reporter.]

The Opening up of Southeastern Nevada—The Pioneer Miner.

The fall of '68 and the early part of '69 witnessed the White Pine ebullition. Subsiding the next summer, a considerable popnlation fouud themselves in that remote, and then isolated locality, without employment, and generally, without either the means or disposition to return. The most of them were miners—many belonging to that bardy, fearless class known as prospectors. The country about, though reputed rich in mineral wealth was but little explored, and, therefore, opened an enticing field for the like of them. Wandering off in every direction and suffering infinite hardships with proverbial patience, they have eince thoroughly explored every portion of Central, Southern and Eastern Neveda, a region likely to prove mervellously rich in every variety of the precious and useful metals. Successively, Eureka, Mineral Hill, Pioche and other valuable districts were found, organized and brough into notice; Schell Creek, the latest, heing by no means the leest of these important discoveries.

The adage of the "ill wind" finds apt illustration in this stampede to White Piue. But for this, how sparse might still have been the populetion of this portion of the State—how little even might have heen kuown of these now prosperous and promising districts! So often does a present seoming ill resolve itself into an ultimate good! And eo of the men who fulfill these honorable missions and achieve these useful ends! Rough and gnarled of person, crippled with toil and tanned by exposure to tho winds and the snn, the miner is still your true pioneer, going forth unaided and unnoticed, and euhduing the savage, he opens up our desolate and harharic lands, and fits them for the abode of civilizetion and productive industry. Last season the territory so redeemed from the wilderness during the past three years, produced over seven million dollare worth of gold and silver bullion, a eum that will he largely increased the present year.

Interest of San Francisco—Need of a Railroad and Mills.

In view of these facts, and the prosperoue future that ohviously awaits this entire section of oountry, one feels warranted in hespeaking for Schell Creek the aid and good offices of the San Francisco business community, since through these means the entire trade of this region can he permanently secured to your city. Let your people hear thie in mind, for in a short time, this business will be worth to them millions of dollars annually. Money is needed here to build mills, also to assist in constructing a narrow gauge rail way to counect this district with Humholdt Wells, on the Central Pacific Road. This is a good country iu which to invest money, at least for these purposes, aud I say this not ignorant nor unmiudful of the losses that have so generally attended the expenditure of money on mining account in all parts of Nevada. At another writing I will give more fully my reasons for this opiniou, content for the present, with urging your capitalists, merchants, machinists and all others interested in extending the commerce and huilding up the industry of San Francieco, to give this matter their eerious attention. A road ouce built to this point would soon he extended eouth along the series of open plains and valleys that reaches all the way from here to the Colorado; passing in its course through or near to the Robinson, Piermont, Patterson, Pioche, Pahranagat and many other already or prospectively important dietricts.

The inductive eteps in this enterpriee have already heen taken hy parties here, the movement being backed hy the Crawfords, large iron workers in Philadelphia, and other wealthy men in the East, those parties being largely interested in the Spruce Mountain Dietrict, lying adjacent to the proposed line of this road, and where extensive emelting worke are now beiug erected. The Central Pacific Compauy also, I am credibly informed, would, with their characteristic enterprise and liberality, further the project, hy remitting in part cost of freight on material transported over their road, and perhaps aid in a still more direct manner, it being their policy to encourage the huilding of these feeders to their mein trunk. This Company have pureued a geueroue course with the Elko and White Pine roed now in process of construction, and would hardly do less for a hranch likely to contrihute still more largely to their carrying traffic; and I may here add, as one having opportunities to know, that the Central Company have, in the main, dealt not only justly but liherally with this section of country throughout, and what ever may he the grievances fancied or real of the people of San Francisco, we feel here that we have no just cause for complaint, since without the facilities for transportation and travel afforded hy this Company, nearly the whole of Central and Southeastern Nevada would still have heen in the hands of the ahorigines—a source of constant annoyence to the people and of expense to the government, instead of heiug, as at preseut, filled everywhere with self-sustaining and prosperous communities.

Our Experience in Silver Mining—Fissuro Viens and Ore in Sight.

It is now 13 years ago since Californians first emharked in silver mining. It is 13 years this very month of June since they first began to hear much of Washoe, a few venturing then over the Sierrae to see what these rumore might amouut to. By the next summer many thousand had followed and the new husiness was gotten fully under way. Teking the Comstock as our typical mine, we set out rummaging through the wilds of Western Utah. Ledges ahounding everywhere, quite a good many were located, care being taken that they should oonform as nearly as might he in external appearance to our representative mine. Much work was afterwards done on these ledges but not generally with eetisfactory results, and as a consequence we ratber lost confidence in "bold croppiugs," "regular strikes" and other indicetione of "trne fissuree," "going afterwards for" "ore in sight," and hecoming enamored of rich and well displeyed surface deposits, such as greeted us at White Pine, Eureka, Pioche and elsewhere. It is true, these have not in every instence, proved "all our fancy painted them," "etill our miners retain a strong prediction for this class of deposits, helieving that it is just as well to engage in gathering up the ore when found on and near the top of the ground as to go delving into the bowles of the earth, in search of it. Hence this class of ores, despite the mishaps of White Pine, ie much in favor, aud as they have nowhere else heen fouud so abundant and of such high grade as here in Schell Creek, this, of course, conforms more nearly than any other district ever yet discovered to the prospectors idea of a "Miuers' Paradise." Go where you will and you see here rich silver oree on the surface. Taken as a whole there never was, perhaps, euch a display of mineral wealth. The ore-bearing helt extends north and south a distance of 20 miles reaching clear across the Schell Creek Rauge and covering an area of forty or fifty square miles.

The mountains here are very lofty—from eight to eleven thousand feet high. They are also ragged aud precipitous—walled with cliffs and cleft hy stupendous ceñons. Being so hoaved and disjointed, they are probahly riven by deep fissures, since filled with metal and their various mineralizers, their upper chambers shatterod and covered up with the debris of geological ruins. From these main fractures run off many small cracks, also carrying ore and smashed to pieces in their upper portions. Hence things iu the upper story are hadly displaced and it is difficult to get the plen of the veiu system or that on which the ores have been distributed. But our experts are unravelling the mystery. Clayton, thoughful, diligent and indefatigable has the key to the whole thing and will soon proceed to unlock it to the world. He pronounces this the best district, every thing considered, yet found on the Coast, and we have great faith in him here. Of the practical men who have visited the country all entertain the highest opinion of its mineral resources and the facilities at hand for rendering them cheaply available. Not a man of this elass has left witbout procuring interests for himself or thoso he represented.

The Character of the Ores Here as well as of the Lodes

Is considerably diversified, the former consieting mainly of the eulphuretted variety, much of it tinged with a ruby color. A good deal of horn and native silver with a chloride ore also occur. The general trend of the lodes is in a northerly and southerly direction with a pitch into the mountain. They are of variable thickness—some very large and some extremely small—stand tolerahly steep though occasionally lying at a low angle. The most of them are contect veins lying hetween porphyry and limestone or shale, and lime, the veiu matter being composed mainly of quartz, some of it light colored and granular and others portions compact and dark, smell quantities of qnartzite limestone and spar heing occasionally intermixed with the ores and the vein matter. The percentage of ore is generally large, and hut very few ledges have heen located which failed to exhihit more or lese on the surface. The most of the prospecting yet done has been hy open cuts on the snrface, though a numher of shafts have heen sunk iu the veiu matter, some to a depth of fifty to sixty feet—several tunnels have also been carried in a considerahle distauce. In every instance these works have proved setisfactory both as regarde ore developments and the probable permenence of the veins themselves. One of these tunnels heing driven into Queen Springs Mountain has cut a well walled, regular vein, four feet thick and carrying a fine hody of ore at a depth of 80 ft. Elsewhere similar resnlts have been ohtained estahlishing a strong probability that the ledges here will prove both prolific and permanent.

What is Required Here Now

Is reduction works with a moderate amount of working capitel to open the mines. Several mills could he rnn for a year on the hundred dollar ore in sight, or at least obviously procured. Lahor is also in demand, at $4 per day for miners; millrights, carpenters and masons getting a little more. Should capital he eupplied for putting up mills and opening the mines to the extent that the prospect now would seem to warrent, the demand for lahor would he greetly inoreased, and business of all kinds he very active. Every thing so far hes been maintained in a healthful condition, but little excitement or epeoulation, and nothing greatly overdone. A number of cash sales of mining properties have been effected and a good many honded, but all seemingly at reasonahle prices, some of the claims containing ore enough in sight to pey the purchase money, could it he economically milled. As regards supplies of

Wood, Water and Grass,

This section of country eurpasses any other lying between the Sierra Nevada and the Wasatch mountains, there being also in the valleys a great deal of fine agricultural land. As a consequence, mining in all its brauches can be carried on here cheap, the climate heing at the eame time extremely healthful and agreeable. This is in fact, a fine country to live in, and apart from its mines will soon be filled with a thrifty population because of its advantages for sheep and stock growing and dairying.

Centreville, White Pine Co., Nev., June 24th, 1872.

The Quicksilver Mines of Almaden, Spain. No. 1.

[Written for the "Scientific Press."]

During my first residence in Spain, from 1860 to 1865, I did not visit these celebrated mines, partly from the pressure of my own husiness, as also their inaccessibility situated in the heart of the Sierra Morena, and reached then, only hy risking equestrian performances on mules of a most douhtful pedigree. On my return to Spain in 1870, I was commissioned by some London capitalists (interested in the English Quicksilver Loan of $10,000,000) to inspect these mines and report to them. These mines, since 1869, can he reached hy railroad from four different quarters of the peninsula—Bilhoa, Lishon, Valencia or Cadiz,

I resided for ahout three weeke at the town of Almaden, and I paid special attention to the ahove celebrated mines, and have no douht that all tbe data I collected will be read with interest by your many subecrihers. My letters will he classified into four different heads—their History, Geology, Mining and Metallurgy.

The word Almaden is derived from two Arahic words, which signify, the "Mine of Quicksilver," hut these mines were worked by the Romane many centuries before the consquest of Spain hy the Moors. Four centuries hefore the Christain era, Theofrastus speaks of the *hard arenaceous* cinnahar imported from Spain. In the time of Julius and Augustus Cæsar cinnahar was imported iuto Rome from the Sisaponæ Cetrohrix region (eo called by Pliny,) the present confines of La Mancha, Estremadura and Andulusia. Vitruhiue also mentious that the raw mineral was imported into Rome, and points out the locality where the distillation was then cerried on.

According to Pliny, only 10,000 lbs. of quicksilver were distilled every year in Rome, and it was calculated thet other places in the empire were provided likewise with cinnabar from Spain to about the same amount. It will he seen, then, that it would have taken the Romans about a century to consume the preseut yearly extraction. Nothing ie known, nor do auy documents exist, relative to these mines during the domination of the Goths in Spain. The Moors worked these mines, end appear to have heen the first who distilled the minersl on the epot, employing it in their chemical laboratories of Cordova. The extraction of mineral, however, did uot increase until 1525, when these mines wore rented from the Spanisb government hy two German mining engineers, Mark and Christopher Fuggar, who employed German minere, and it was then for the first time, thet a proper system and order in the workings was carried out. These two hrothere reelized such princely fortunes from these mines that it became a proverh to say "as rich as the Fuggars," and a street exists to this day in Madrid with their name. The yearly production increased considerahly, in consequence of the discovery of the amalgamation of silver ores in Mexico in 1566 hy Bartolome de Medina, at the mines of the Real del Monte, and it rose to about 600,000 lbs. of puicksilver per year.

I well rememher in 1867, while residing at the town of Pachuca Real del Monte, seeing the spot where the Franciscian Friar, Bartolome, made his first experiments in reducing silver ores hy (patio) amalgamation. No monument exists as yet to the memory of this celebrated monk, and the first steps taken in this direction were made by the lete Emperor Maximilian, but frustrated by the tragedy of Queretaro.

In the year 1752 William Bowles (the first Englishman who visited these mines) received ordere from the Spanish government to inspect them, and he mede many improvements in the distillation of the ore, as likewise a better eystem of working the mines. Here we have one of the many instances of Anglo-Saxon pluck end energy, carrying science and knowledge into far distant climes. I may also here mention another extraordinary case. In 1728 Lady Mary Herbert, daughter of the Marquis of Powis, arrived at Madrid, from Paris, and by her acquaintance with the famons Mr. Law had improved her talents and natural gonius for enterprise. She made proposals to the Spanish government for draining the famous mine of Guadalcanal; these were accepted. Lady Mary set out for the mines; in this expedition she was attended by Mr. Joseph Gage. She procured engines from England, as well as miners, engagiug her own fortune therein, as also that of Mr. Gage. Consideriug the great difficulty of traveling in those days—the non-existence of roads—this lady's pluck and energy were most astonishing. About the year 1700 the production increased to 1,800,000 lbs., which amount was annually supplied to Mexico and Peru for the amalgamation of their silver and gold ores, and it has continued ahout the same to tho present day, with an interruption of some four years during the Freuch invasion of the Peninsula. The amount produced in 1870 was about 2,200,000 lbs., upon which the Spanisb government msde $1,250,000, and this has heen the average profit for the last century and a half. In my next I will describe the topography and geology of this district accompanied with euitable illustrations and diagrams.

HENRY SEWELL.

Salt Lake, June 16.

RAILROADS ON THE PACIFIC COAST.—The distribntion and cost of railroads in the States aud territories of the Pacific coast is as follows:

	Miles Complete	Cost and Equipment.
California	1,111.30	$76,902,000
Nevada	567.00	51,500,000
Utah	312.00	30,400,000
Oregon	199.00	7,900,000
Washington	50.00	2,620,000
Total	1,239.30	$169,322,000

IRON.—Furnaces have eo multiplied in Lehigh, Penn., under stimulation of a very high protective tariff, that the *American Manufacturer* warns iron men to desist. It appears tbat the sources of ore are hecoming exbausted; and at this time there is not enough withiu reasonable haul to enpply existing works. A wire-rope factory on a large scale (5,000 feet long) is being built at Wilkesbarre, Penn.

SCIENTIFIC PROGRESS.

Dr. Carpenter's Theory of Ocean Currents.

Dr. W. B. Carpsnter presente in the *Popular Science Review* a very interesting *resume* of the resnlts of his deep-sea investigations. In his first expsdition to the deep channel between the shetland and Faroe Islands, at the depth of 600 fathome in ons place ths self-registering thermomcter indicated a temperatnrs of 45 to 48 degrees Fahr; whilo at another part of the channel, only twenty miles away, a temperaturo of 32 degrecs at the bottom was recorded—a vory marked and curious contrast. The next year most remarkable contrasts of bottom temporature were shown at differsnt depths on ths southern slops of tho samo channel. At a depth of 190 fathome, the temperature was 48 degrees, while only eight miles uorth where the depth increased to 445 fathome, the thermometer sank to 30 deg.—thus showing a difference of deep-sea temperature of 20 degrses within that short descent of only 225 fathoms in depth. At both places the surfaco temperature was 52 degrses. Further where ths surface tsmperaturo was bstween 49 and 50 degrece, serial soundings indicated at 350 fathoms a temperature of 32 degreee, that of freezing water; and from that point to the bottom, 640 fathoms a river of glacial water waa found, below the freezing point of fresh water.

In one of his more recent expeditions off the coast of Spain and Portugal, where the surface temperature of the water was as high as 65 degrcss, serial soundings indicated a loss of ouly 10 degrees for the first 100 fathoms; which, therefore, may be termed the superheated surface, nnder the powerful rays of a midsummer sun. Then, down to 300 fathoms, the temperature lowered very slowly only to 49 fathoms, showing a warm stratum of water. But in the next 200 fathoms there was a descent to 40 degreee; and from this level of 1,000 fathoms to the bottom, at 2,435 fathome or nearly 3 miles—a depth about equal to the hight of Mt. Blanc—the temperature steadily lowered to 36.5 degreee and still lower resulte were obtained near the equator. Here then was a lower stratum of very cold cold water of no less than 1,400 fathoms in thickness. Commander Chimneo found olose to the Eqnator, 3 degrees S. latitude, a bottom temperature at 1,800 fathoma of 35 degrees, and at 2,306 fathoms one of 33.6 degrees.

Whence comes this deep layer of nearly freezing water, and how does it retain its low temperature? As the water above it and the earth below it are warmer, it could not long retain its temperature if stationary, unless continually snpplied from some constant eource of glacial cold. That it possessee the movement of a running stream is shown hy the nature of the bottom, the pebhles there being rounded instead of angular; and that it comee from the polar regions, is proved hy the fact that it may be traced to them in its slightly decreasing temperature. To the westward of the Faroe banks is a steep slope, going down 2,000 fathoms; from here to Labrador and Greenland ie a wide channel, through which a large mass of ice-cold water may pass into the great Atlantic hasin.

But water cannot be alwaye flowing out of the polar regione without water from eome other source constantly flowing in toward it; so thst, if there is such an outflow helow, the circulation must be completed hy a coustant inflow at the surface above. This Dr. Carpenter finds in the Gulf Stream, and the universal movement of heated water from the equatorial to the polar seas.—*The Week.*

Spontaneous Explosions.—F. Moigno says: —When finely pulverized chlorate of potash ie put on a piece of paper (best dredged or dnsted over it, so as to form a thin film of powder), and there ie next poured over it a solution of phosphorus in bisnlphide of carbon, there enenes, when the latter is evaporated suddenly, a most violent explosion, owing to the phosphorus being left in a state of extremely minute division and in intimate contact with chlorate of potash. Thie explosion is analogous to that which ensnes when a small piece of phosphorus and some chlorate of potash are, when placed upon an anvil, struck with a hammer, but, in the instance alluded to, the effect produced is greater, owing to the extreme state of division and intimate mixture of the two suhstances. Care should be taken not to make this experiment with too large quantities of the chlorate and phosphorus solution, for fear of serious accidents which might ensue.

Absorbing Sulphurous Fumes.—M. Cahen, the author suggests for thie purpose the nse of peroxide of manganese of low quality; The absorption of sulphnrons acid gas, included that evolved in metallurgical operations, is instantaneous; and if the ensuing manganese salts do not happen to he commercially of use they can be readily, by means of chloride of sodinm, converted into hyposulphite of soda and other soda salts.

The annual cost of maintenance of the galvanic hatteriee used by the Weetern Union Telegraph Co., is over $125,000.

Gas Burners for Bending Glass Tubes.

The *American Chemist* for January contains a note by Prof. J. Lawrence Smith, "On Bending Glass Tubes for Fitting Apparatus," in which hs reccommends a Bunsen burner flattened at ite extremity so as to give a thin broad flame. An ordinary fishtail or batwing gas-burner will bs found to give, if possible, still better resulte. Mr. H. Carrington Bolton writes that he has employed for some years au ordinary batwing burner attached to a small, short stand (three inchee high, burner inclnded), eo as to rest low upon tho table, in order that raising the arms inconveniently high may bs avoided. Such a burner insures a broad flame, by which ths tubo is heated for two or more inches in length, the tube is turned while in the flame, and removed for bending ne usual, the deposit of carbon which at first sight might seem an objection is really one of the chief advantages of nsing this burner. On placing the glass in ths flame the deposit begins immediately, and prevents too rapid a rise of temperature and consequent cracking of the glass; during ths heating the carbon tends to distribute the heat eqnally over the surface of tho tnbe; and finally, on withdrawing the glass from the flame, too sudden cooling is prsvented, and the glass is, as it were, annealed.

Ths black deposit is readily removed by a dry cloth. This plan was commonly employed in Homann's Laboratory, Berlin. In bending tubee of more than three-sighths of an inch in diameter one end should be cloeed tightly with a cork (or wax), and air blown into the other end at the moment of bending the tube; by regulating judiciously the pressure of the air upon the sides of the somewhat softened tube, the latter will neither bulge out nor collapse, bnt will retain its proper caliber. This cannot be effected, however, with very large tnbes, or with very thin ones, which require the nice manipulation of the professional glass-blower. —*Am. Artisan.*

Faulty Vision in Painters.—Considerable attention has been attracted by a lecture delivered hy Dr. R. Liebrich on this snbject at the London Institution. The lecturer referred particularly to the case of Turner, hetween whose earlier and whoee later paintings a marked differcnce appears. The prominent featnre of the change consists of a vertical *streakiness*, each luminons point being changed into a vertical line. Now it ie commonly eupposed that Turner adopted a peculiar manner and exaggerated it more and more. The fact, accordiug to Dr. Liebrich, appears to he that the change of manner arose from a change in his eyes, a growing dimness of the crystalline lens causing him to see hoth nature and his own pictures incorrectly. The gradual change was traced hy the lectnrer, and its effects illnstrated by the use of lene and of picturee projected on a screen.

Other caees arising from irregularitiee of refraction in the eye were epoken of. It may occur that an eye is normal in one direction and ahnormal in another, and hence distorted pictures are produced, eo there are affectione of the eye in regard to color.

Somo of Turner's admirers have come to the vindication of their favorite, and have been trying to disprove the doctor's reasoning.

Natural Selection in Plants.—An attempt is made by Dr. Chauncey Wright, in the *Memoirs Amer. Academy*, to explain on the principal of natural eelection the existence of the modes of phyllotaxis most frequently found in Nature. These consist of two principal forms, the verticillate and the spiral, of which the latter is by far the most general and most complicatcd. By an elahorate series of circulations he shows that the particular forms of spiral arrangcment actually found in Nature are those which possess the greatest advantage for the plant, hy so arranging the leaves, and, therefore, branches, that they have the most perfect distribution for not intsrfering with one another, both in drawing nutriment from the etem and in exposure to the light.

To Protect Iron and Steel.—Prof. F. Grace Calvert, of England, has diecovered that the carhonates of potash and soda possees the same property of protecting iron and steel from rnst as do those alkalies in a caustic state. If an iron hlade is half immersed in a solution of either of the ahove named carhonates, it exerts so protective an action that that portion of the iron which is exposed to the influence of the damp atmoepheric air doee not oxidize, even after a period of two years.

Similar results have been obtained with sea water, to which have heen added the carbonates of potash or soda. The applications of this fact are numerous and important.

Atmoepheric Thermal Paradox.—The higher we ascend, the colder it hecomes; and yet at very great elevations the raye of the sun exert a heating power greater than that which they are found to produce in the valleys. Prof. Piazza Smyth found, that on the top of Teneriffe, at an elevation 10,000 feet above the level of the sea, a thermometer exposed to the direct rays of the sun, ehowed a temperature of nearly 200° deg. Fah !—*Prof. Phin.*

The conversion of water into vapor develops electricity

MECHANICAL PROGRESS.

A New Methon on Determinino the Quality of Iron.—Mr. VsuRuth, Inspector of Mines for the Dutch government, has devised a method of printing from iron in such a manner as to show its fibre, and give a correct picture of the same for comparison or reference. The sample of iron whose fibre, is to bs examined is first planed, so as to expose a suitable section, through any desired point; this section is immersed in muriatic (hydrochloric) acid for such time as is necessary to eat out the cinder; this time varies from six hours to twenty-four honrs according to ths strength and temperature of the acid solution. The cinder is attacked in a more rapid manner than the fibre of tho iron, and the effect is that ths fibrs is left in relief—in fact, an etched plate is formed, from which, by suitable ink or other substances, an engraving may be printed, showing every fibre of tho iron in clear and distinct manner. Ths application of this simple process is too obvious to need much description. Whenever ths formation of piles in a rail, round or other aection of iron is requirsd, here is a quick and handy method for discovering it. As a means of studying the alteration of fibre in the neighborhood of welds, it is invaluable. It may also be applied in supplying information in relation to Mr. Tresca's valuable memoire on ths flow of eolids.

The Peo Switch has heen adopted as the standard by the Western Union Telegraph Co. The diagram shows ite connections as adapted to the requirements of a way office. It is eo simple, and yet eo perfect, that only a very hrief explanation of the reference marke upon the diagram will be necessary to a full understanding. 1 repreeente a vertical metallic bar or strip upon the ewitch, to which ie connected a wire running into an office, and 2 repeesente the eame wire going ont. A and A′ and B and B′ are metallic huttons, to which are connected the instrument wires. All the hnttons upon the same horizontal line are conuected together at the hack of the ewitch.

As shown in the cnt, the circnt ie "open." To close it, with instrument in circuit, it would he neceesaray only to insert two metal plnge

or pegs; one at the orifice at B′ and 2, and one at A and 1. The course of the current would then be as follows:—From the line at 1 through the peg connection at A to instrument; through inetrument to B and B′; through the peg connection there to the line at 2, and so out to the main line. Should it he desired to connect the line through, without instrument in circuit, the insertion of pegs in the orifice of either A′ or B′ would effect the desired result. The same form of switch, with a modification of connections, would answer for a terminal office. For this, let it be nnderstood, that a wire, leading from a hattery, one pole of which is grounded, is taken directly to one side of the instrument; through the instrument it goes to A; from A, if a peg he inserted in its orifice, it goes to 1 and to the main line. If, instsad of placing the peg at A and 1, it be placed at A′ and 2, the instrument would he connected to line 2. It will be eeen that in the terminal form but one line wire is necessary to be on the ewitch, and but one wire to the instrument to form a circuit, while in the way form two of each are required.—*Jour. Telegraph.*

Railroad Torpedoes.—One of the neatest and most effective little arrangemente for safety in railroad operations is the "torpedo" or alarm signal. Thie little affair consists of a tin hox ahout the size and shape of the smallest-sized blacking-boxee. The box is filled with an explosive compound, and two strips of tin are soldered to two opposite sidee of the hox perpendicular to its sidee or edges, for fastening it to the rail. These hoxes explode on the principle of the percussion-cap, with a lond report. They are in uee on some roads for night signals and in foggy weather, when lights or flags would not he seen in time to prevent accident. Track-men are provided with these torpedoss, and in case of danger they are placed on the rail, far enough from the place of danger to prevent disaster. Usually three of them are placed a few feet apart, to insure their being heard hy the engineer. They are reliable, and will explode at the touch of the wheel at the slowest speed. They cost hut a trifle. It is said that the Reading company uses 35,000 of the torpedoes per annum on the roade which it operates.—*Railroad Gazette.*

Road Steamers—Rubber Tires.

The use of steam on common roads has made great strides during the past year, and it is but fair to Mr. Thompson, of Edinburgh, to state that much of this progress is due to him. Let what will be said on the subject of india-rubber tires, it is day by day becoming more evident that an elastic wheel of some kind is eesential to the full eucceee of ths tractlon engine or road locomotive. One of the great objections to its use hitherto urged against it has been sxtremsly slow speed at which alone it could travel. A nominal velocity of 4 milee an hour really meaus, when all deductions are made for the delaya incurred by stopping for horsee, taking in water, etc., a rate of not more than two miles an hour. This does not tell heavily in one ssnse against loaded engines, but it greatly increases the cost of working them, in that, in returning light for a seeond load, ths duration of a trip is unneceesarily prolonged.

A traction engins, to bs readily efficient, should be competent to travel, when it geta a chance, at six miles an honr; more is nnneeessary for ordinary work. This speed cannot be obtained without springs of some sort. It is however, very inconvenient to apply eprings in the ordinary way to the driving wheels, for reasons too obvious to all builders of snch machines to require comment; and it must further be remembered that, even if thie were not the case, the duties of a epring are but half performed when the spring is located between the engine and the axle. A six feet wheel of sufficient breadth, to be strong enough, will weigh about 18 cwt., in some cases as much as 22 cwt. It is not too much to say that the dead weight, unaffected by the use of springs, will therefore amount in a 12-horse power traction engine to rather more than two tons, which is highly objectionahle.

The only way out of the difficulty lies in placing the spring at or in the tire of the wheel, and the success which has attended Mr. Thompson in hie lahors is due to the fact, that his india rubher tire exactly complies with this condition. The great objection to the india-rubher lies in its enormous cost—over $500 for a moderate sized engine—and the nncertainty of the material. Thus the Ravee on her wonderful trip from Ipswich to Edinhurgh and hack, rendered one leading tire nseless on her journey to the north, and ehe disabled another on her journey to the south. As the tiree cost about $250 each, we have an outlay of ahout $500 for a journey of 900 milee, or a cost of 67 cts per mile for tires alone. The ruin of the tire in this case wae no donht, mainly dne to the heating of the rubher caused by the high epeed maintained.—*Engineer.*

Reducino Steam-Powen.—It is much more economical to reduce power below that which the boiler and engine can give, than to do ths reverse, and to drive the boilere and engine above their fair capacity, not to speak of the danger involved. There are eeveral ways of saving fuel by reduction of power; one is simply to economize hy carrying less pressure in the boiler; another to carry the same preesure, hut to aave steam hy some cut-off arrangement; a third hy changing the size of the main pulley, so as to keep up the same velocity of the mahinery while the engine runs at a lesser velocity. Which of these methods is the most economical is difficult to say. It depends on many circumstances, as for almost every engine there is a peculiar rate of velocity, steam-pressnre, etc., at which it runs to the best advantage. *Manufacturer and Builder.*

Cæsium.—Few sources of the rare metal cæsium have recently heen discovered, which somewhat extend the range of ite distrihution. It has lately been detected in the water of the hot spring of Wheal Clifford, England, hy Col. Yorke, who finds 1.7 parts of the chloride of cæsium in one million parts of the water, making the latter ten times richer in this metal than that of the Durkheim spring, in which it was originally discovered hy Bunsen. Professor Miller had previously found a considerahle amount of lithium in the water of this spring. From an examination of heryl from the Island of Elha, E. Becchi announces in the *Ealrbuch fur Mineralogie* the obtaining 0.80 per cent. of cæsia. Elha is the locality of pollux, the mincral which contains the greateet percentage of this metal.

Quick Work.—The Cabot Co., of Brunswick, in order to enlarge their cotton mill, latsly moved their large smoke stack chimney—78 ft. high, 7 ft. 9 in. square at hase and 5 ft. square at top, containing over 40,000 hricks and weighing over 100 tons—twenty feet without rollers, halls, guys or hraces to steady it. Not one of those engaged had ever witnessed the moving of such a hody. It was accomplished by building such ways as are used in launching ships; surfaces planed and greased, chimney wedged np aud moved hy two jack-screws in 4½ hours. The flues were disconnected from the hoiler at 1 P. M., and at 9¼ the same evening the flues were again connected, fires going and eteam np.—*Industrial Monthly.*

MINING SUMMARY.

THE following is mostly cond- nsed from journals pub lished in the interior,in proximity to the mines mentioned

AMADOR COUNTY.

KEYSTONE.—Jackson *Ledger*, June 22: This mine continues its monthly yield without diminution, never falling below $40,000.

BUNKER HILL.—Work has been resumed on this mine, and will he prosecuted vigorously.

MAHONEY.—Work is heing vigorously prosecuted with flattering prospects. The main shaft is down 500 ft., with a well developed ledge of excellent gold bearing rock.

CALAVERAS COUNTY.

PRUSSIAN HILL.—Calaveras *Chronicle*, June 22: The mill heing put up at this mine, near R. R. Flat will he ready for operation next Monday.

CLEAN UP.—A recent "clean up" in the Calaveras Hydraulic Co's. claim, Central Hill, after a run of 5 or 6 days, gave $1,200 as the result.

EL DORADO COUNTY.

CLEANED UP.—Placerville *Democrat*, June 22: The Oregon Ravine Co. have just completed their "clean up," after a run of about 3½months, with an expense of a little over $2,000. The amount of gold they took out was $4,005 63.

INYO COUNTY.

BULLION.—Inyo *Independent*, Jnne 15: On the 6th inst. there were shipped from the Desp Spring mill 1,721 oz. valued at $2,000—the proceeds of Lida Valley ore.

NEVADA COUNTY.

HOPE GRAVEL MINE.—Grass Valley *Union*, June 21: This mine is again heing worked with success. On Thursday of last week the mill was started np, after an idleness of several months. The first run on a pile of tailings was cleaned up on Tuesday and resulted in $601 worth of gold.

KNIGHT OF MALTA.—Yesterday afternoon the mine sent out some magnificent quartz, showing fres gold sulphurets.

TOWN TALK.—This old gravel mine continues to pay about $2,000 per month, out of which there is a clear profit of ahout $1,200.

GRANITEVILLE.—Nevada *Transcript*, June 18: The Erie Co. struck a 5 ft. ledge on Friday last, the richest of any rock that has ever heen found in this dist. There is a very large seam of gold running through the ledge, and scarcely a piece of the rock hut what shows gold.

The gravel claims of Crandall & Co., near Graniteville, are paying from $10 to $12 per day to the hand.

OUSTOMAH HILL.—Gsntry & Co., have heen washing without iuterruption for several months.

RICH CLAIMS.—Marks & Co's. diggings, at Brandy City, continue to pan out well. Last week they cleaned up $32,000.

BIG PROFITS.—Marks & Co. cleaned np in their drift diggings, at Relief Hill, last wesk, $4,600 while their expenses for the entire run was only $150.

PLACER COUNTY.

SPLENDID PROSPECTS.—Auburn *Stars and Stripes*, June 20: Mining operations are in progress on ths quartz ledge which runs through the Salsig ranch. The Co. have a shaft down ahout 40 ft. in profitable milling rock all the way. For the last 5 or 6 ft. their ledge, which averages from 18 to 20 inches in thickness, has yielded high grade ors, showing free gold, heavily loaded with galena and other suphurets and uniformly yielding up in the hundreds of dollars per ton from working tests.

AUBURN G. M. Co.—The location embraces 1,200 ft. in length of ledge. Ahout 400 ft. west from the eastern extremity of the ledge is the main shaft, which is down 107 ft. A new level has recently heen started to the eastward at a depth of 35 ft. Down to this level the ledge consists of red decomposed quartz very friahle and therefore capahle of heing easily and economically extracted and worked. Dillon & Co., in sinking to a depth of 30 ft., took out and crushed at McFadsn's mill, Ophir, 50 tons which yielded $79 per ton, exclusive of sulphurets. From the 30 to the 60 ft. level the same Co. took out 100 tons which yielded $59 per ton. On a test of average rock from the 97-ft. level it was found to yield at the rate of $81.52 per ton. At the depth of 107 ft. the ledge is 4 ft. 2 inches in thickness, and rauges from 18 inches up to that thickness all the way from the surface.

NORTH STAR.—Anhurn *Herald*, June 22: Since the heginning of the present year the Co. have made 4 clean-ups of $1,180, $1,314, $2,165 and $2,345, respectively.

PLUMAS COUNTY.

SILVER CREEK.—Cor. Plumas *National*, June 15: The Devil's Elhow Co. have completed their gigantic tunnel under what is called the Devil's Elhow Mountain, on Spanish Creek.

Challen & Co., on east side of Gopher Hill, have found a splendid channel of pay grit in their tunnel.

McVay & Taylor are husy at work on the Silver Star claims. They have an open cut run across their mine 1,500 ft. in length, 12 ft. wide, from 5 to 6 ft. deep, and are waiting for lumher to commence laying their flume.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, June 13: Bullion amounting to $1,200 was shipped to S. F. hy W., F. & Co. on Sunday.

TRINITY COUNTY

RICH STRIKE. — Weaverville *Journal*, 13: L. Fakes lately struch good diggings near the East Fork of Cañon Creek—himself and 2 other men taking out $100 per day. One day last week they found a nugget weighing 5 ozs.

JUNCTION CITY.—Cor. same: Hagar & Haas, on the hill back of town, will clean up next week, and will do well. Weise & Co., at Red Hill, will wash up soon. Andrew Asmussen has lately opened a claim helow Charles Bartlett's, with fine prospects. Taking it all through, the mines about Junction City will render a good report at the close of the season.

TUOLUMNE COUNTY.

SOULSBY QUARTZ MINE.—Sonora *Independent*, June 22: An English Co. has recently purchased the mine, located at Soulshyville. Active operations will soon he resumed. This will give employment to some 50 or 60 men.

OHIO.—The Co. are engaging hands to recommence work in the tunnel, which lacks but a few ft. of reaching the vein. The vein is from 8 to 9 ft. in width, and averages $20 per ton. A ten stamp mill is on the claim.

Sonora *Democrat*, June 22: PICK UP.—Hart and Wooters, picked up a piece of quartz in the "Riffle" lot claim this week, weighing 31 ounces, well spotted with gold.

YUBA COUNTY.

Grass Valley *Union*, June 18: SMARTSVILLE.—The Blne Pt. Co., after 65 days' washing, took out $90,000.

Nevada.

ELKO COUNTY.

Elko *Independent*, June 22: CONS. S. M. Co.—The ore in some portions of the vein assays as high as $800 per ton, and the whole body runs near $900.

COPE.—Cor. Silver City (Idaho), *Avalanche*, June 13: The El Dorado, on which steam hoisting works have recently heen erected, is in full hlast. The stopes in the old mine look well, and will send out lots of good ore. The shaft is all fitted, and started to sink helow the 1st level (125 ft.) for the 2d. The ledge in the shaft is large, fully 2½ ft., with ahout 6 to 10 inches of splendid rock that will mill $150 per ton.

The Excelsior is heing worked in good earnest. Stopes seem to turn out well; shafts and drifts are heing pnshed right ahead, and much prospecting is heing done.

The Independence, which joins the Excelsior on the north, is hsing worked through a new incline shaft, which has been recently sunk in a large hody of ore as can he found in any camp.

At the Monitor, is a large qnantity of ore waiting shipmsnt, and plenty more on the inside. Several other claims are heing worked vigorously.

ELY DISTRICT.

BULLION.—Ely *Record*, June 16: During the past wesk, W. F. & Co. shipped hullion valued at $106,977.88.

A NEW and important strike has been made on the 423-foot level of the Lightner shaft; as a few days since, in running the lower drift, a large body of very rich ore was cut into. The ore shows fully 8 ft. in width, and is equal in richness to any yet found in the mine.

CHAPMAN No. 2.—This claim is the first west of the Chapman. The shaft is down 90 ft. A drift has heen run from the hottom of the shaft due west, toward the Huhn & Hunt, on the ledge and ore, the entire distance. It is the intention to erect hoisting works.

LOUISE.—A contract has heen let hy the Supt. to sink 50 ft. on the Anna Dickinson, which will make the shaft 120 ft. in depth when completed. This mine is looking well; ledge shows full width, and carries mineral throughout, and a good hody of ore can he ohtained hy sinking. A contract to sink 100 feet on the Grattan shaft has also heen let. On the Goodspeed shaft work is going ahead as usual, and the mine looks extremely well throughout. The shaft is down 60 feet.

IVANHOE.—New shaft down 75 ft., showing 4 feet of ore in the hottom. This ore assays from $75 to $120 per ton, and carries a larger per cent. of gold than any yet discovered in the district.

BOWERY.—Prospecting in the old works continues, and indications are good.

RAYMOND & ELY.—Work on this mine continues as usual, and are shipping usual quantity to mill. On the 423-foot level, in the east drift, an immense hody of high grade ore, 8 feet in width, has heen struck.

HARPER.—Shaft is down 41 feet, and sinking going ahead with good progress. A depth of 50 feet will run a drift, to the ledge and prospect thoroughly.

TOWNSEND.—Shaft 280 feet deep, with the lede 4 feet in width; hut as yet it is harren.

BURKE TUNNEL.—In ahout 600 feet, and pushing ahead.

MOCKING BIRD.—Sinking of shaft continues, and mine looks very well throughout.

ALPINE & MEDASSA CON.—In sinking the shaft, three distinct ledges have been cut through, all carrying ore and assaying well for the depth at which they were cut.

WASHINGTON & CREOLE.—Shaft down 28 feet helow the 442-foot level, and still sinking. Since P. C. Hyman took charge, 2 drifts have hsen started east, one from the 342-foot level, and the other from the 442-foot level. At present, ahout 150 tons of ore on the dump, which will mill on an average $100 per ton.

GREY EAGLE.—Sinking of shaft goes steadily ahead, and good progress is heing made. Ore shows 2½ feet in width in the hottom of the shaft, and looks very well.

CHIEF OF THE HILL.—Have not yet made air connection with the surface. In raising, a fine hody of ore, 2½ feet in width, was opened up. Mine looks well.

DESDEMONA. — Pushing the west drift ahead, and in 125 feet from Fuller shaft. The drift is within 110 feet of the discovery shaft. Sinking of discovery shaft continues, and is within 20 feet of the level of the drift rnnning west from the Fuller shaft.

CONDOR. — Work on sinking new shaft progresses slowly, as the rock is very hard. The old shaft is down 136 ft.

NEWARK.—Will shortly commence timhering the shaft throughout. At present sinking of the winze on the lower level continues.

CHAPMAN. — Commencing to stope on ore. Work on sinking of shaft has heen temporarily suspended. The working force will be increased to-morrow.

AZTEC.—Shaft down 50 ft. Ledge shows wsll in the hottom, and carries about a foot wide of good milling ore.

EXCELSIOR.—Have commenced sinking a new winze on ore, from the 150 ft. lsvel. Have also increased the working force, and are now stoping.

SPRING MOUNTAIN TUNNEL. — Drift on second ledge in 40 ft., and improving as opend out.

PACIFIC TUNNEL.—Pushing tunnel ahead rapidly, and making ahout 4 ft. every 24 hours. Looking very well in the face.

SPRING MOUND.—The whim has heen completed and timbering of the shaft is almost finished.

MEADOW VALLEY.—Shipping and raising the usual quantity of ore. Work on the huilding over the Summit shaft has heen commenced, and the house will soon be completed.

ALPS.—Still sinking on the new working shaft, and making ahout a foot a day as the ground continues very hard. Shaft down 120 ft.

SUNBEAM.—Just cutting into the ledge, with small seams of ore coming in constantly. Expect to he into a good hody of ore in a few more shifts.

STIRLINE. — Mine looking well. The shaft is down ahout 142 ft. with a ledge showing in the bottom.

ORLEANS. — Sinking of shaft going ahead as usual, good progress being made. Ore is showing in huuches through the ledge.

PHENIX.—Shaft is down 246 ft. and contract has heen let to sink it 100 ft. deeper. The mine looks well and promising.

SAN JOSE CON.—Running tracing drift on the ledge towards the Alps. Ledge carries mineral throughout.

INOOMAR.—Sinking of new shaft continues with good progress.

HUMBOLDT.

BULLION.—Unionville *Silver State*, June 22: Amount shipped from the Arizona mine, since our last issue, was $7,786.

ARIZONA.—This mine is heing worked with a force of 90 men, who raise daily a large amount of hoth milling and shipping ore, and are extending explorations in all directions from main level.

REESE RIVER.

MONITOR ORE. — Reese River *Reveille*, Juns 13: There are 50 tons of rich ore at the Manhattan Mill awaiting crushing from the Monitor mine at Belmont; 33, tons of unassorted ore from the same mine were worked at the Mammoth Mill last week which yielded $423 per ton. Ahout 100 tons on the dump,

MURPHY CO.—The mill of the Murphy Co., Ophir Cañon has heen closed down for a short time. In the meantime, work is progressing in the mine, 30 men heing engaged stoping. Sinking and running drifts. A fine hody of ore has heen struck in the third south level, the extent of which has not yet heen developed although it covers the entire surface of the drift.

JEFFERSON CANON ORE.—Mr. J. C. Johnson had crushed yesterday at the Manhattan Mill, 3¾ tons of ore from the Jefferson mine. The ore was divided into 1st. and 2d class. The assay of the former heing $966.08 and of the latter $662.88 per ton. The ore was taken from within 6 feet of the surface.

WASHOE.

BULLION.—Virginia *Enterprise*, June 22: There was yesterday received at the Bank of Cal. $20,293.15 in silver hars from ths Belcher.

LOCAL SUMMARY.—Gold Hill *News*, June 22: CROWN POINT.—Daily yield nearly 600 tons, keeping all the mills of the Co. again running. The water heing out of the 1,300-ft. level, the ore developments heing made at that point are of the richest and most important character.

OPHIR.—Shaft down 1,360 ft., and in good ground for sinking. The drifts both north and south at the 1,100-ft. level show a much more favorahle appearance, giving good promise of ore developments.

YELLOW JACKET.—Daily yield 25 tons from the old workings; prospecting, not developing any new ore bodies as yet.

KENTUCK.—Daily yield 50 tons of milling ore from old workings. The water from the Crown Point heing ahout drained out again, prospectiug at the lowest level of the Kentuck will he resumed.

IMPERIAL-EMPIRE.—The incline is down 92 ft. helow the 1650-ft. level and still making good downward progress. The drift west of the ledge, at the 1,000-ft. level, is in 300 ft., and the rock indicates proximity to the ledge.

JUSTICE.—Yielding daily about 20 tons of good paying ore from the south mine. Thus far no operations have heen resumed in the drift at the 400-ft. level, other than clearing out, repairing, etc., which was interrupted by the water.

SAVAGE.—Daily yield a littls over 200 tons, assays averaging $22. Considerahle prospecting is heing done at the 1,500-ft. level, with no new devslopments as yet.

JACOB LITTLE.—The tunnsl running northerly develops a fine ledge of paying ore, which is evidently ahout 20 ft. wide. Over 100 tons of it is on the dump ready for hauling to mill.

HALE & NORCROSS.—Daily yield, 50 tons, principally from the second station of the lower mine.

NEW YORK CON.—Owing to great influx of water the first of the week, further sinking in the main shaft had to be discontinued.

CHOLLAR-POTOSI.—The Blue Wing and other ore sections are looking and yielding fully as well as at our last report. Yesterday $30-000 worth of hullion was shipped.

RED JACKET.—The ledge is ahout 4 ft. wide, and widens as it passes fnrther into the hill.

CON. VIRGINIA.—The favorahle indication at the 500-ft. level still continues, and the spots of ore give promise of a good hody hefore long.

BELCHER.—Daily yield 280 tons, from the 1,100-ft. level. The main incline is down 420 ft. helow the 850 ft. level and the drift west from ths 1,100-ft. level to intersect it in 100 ft.

CALEDONIAN.—New shaft down 710 ft. At the 400-ft. level the drift is in 132 ft. Prospects are good and all working well.

DANEY.—The shaft is down 80 ft. below the 500-ft. level.

GOULD & CURRY.—Incline down 75 ft. helow the 1,500-ft. level, and making fair progress. The east drift is in 165 ft.

BUCKEYE.—Daily yield 22 tons. The ore stopes are looking and yielding excellently.

KNICKERBOCKER. — Shaft down 317 ft. Rock very hard, and some little water coming in. The new hoisting works operate exceedingly well.

LYONS & LELAND.—The fine hack ledge opened by the lower tunnel is looking splendidly.

SUTRO TUNNEL.—Total length 2,933 ft.

SUCCON.—New shaft down 150 ft., and better progress being made as the rock is getting softer. Mill not running.

JULIA. —The ore the shaft is passing through in sinking, assays about $12 to the ton. One little streak about an inch wide assays over $2,000 to the ton.

SIERRA NEVADA.—Daily yield, 50 tons.

WHITE PINE.

TREASURE HILL MINES. — White Pine *News*, June 15: EBERHART & AURORA CO.'s MINES.—The Beecher and the North Aurora works are pushed ahead as usual, with but a limited force of men. The ore in the different workings shows an increased body. The South chamber, leading from the Lady's chamber of the North Aurora has improved since last report.

BEECHER CO.—There is a force of 10 men employed in the underground works at present running 2 drifts on contract, from the Ward Beecher and No. 4 shafts. Extracting 25 tons of ore per day.

HAMILTON & CO. — Col. Miller is busily engaged in placing the mill and mines in shape. A force of men is at work on the Pogonip & Othello mines, on Pogonip Flat. It is expected that the mine will be crushing in 10 days from date.

SOUTH AURORA.—The Sup. ie making preparations for putting the diamond drill at work.

SILVER WAVE.—The ore in the Boswell chamber holds out in body and grade. The ore on the dumps will be shipped soon.

SAN JUAN DEL RIO—The Co. has let a contract to sink a shaft 100 ft. deep on the ore body. Ore of high grade has been taken out, and there ie a good show for the ore body to hold out.

ORIGINAL HIDDEN TREASURE.—There is a force of 65 men employed in and about the mine. A contract has been made for the hauling of ore to the Big Smoky mill for 3 months. The mill has been running steadily since starting up.

SECOND SOUTH HIDDEN TREASURE.—At the time of the miners' strike, the west drift had reached the west wall of the so-called ore channel. A body of quartz and ledge matter 15 ft. in thickness was cut through before reaching the wall.

COPPER GLANCE.—The ledge as far as developed, ehowe 15 ft. of good milling ore. A contract is let to sink the north shaft 40 ft. A drift will he run south from the bottom of the 40-foot shaft to connect with the main shaft.

PENNSYLVANIA.—The Company hae resumed work.

SUNBEAM.—The owners are cleaning out the shaft and breasts, and will soon commence extracting pay ore.

MAMMOTH.—Working 100 men. Ore in the new cut is opening ont well. About 6 tons is extracted daily, which assaye $100 to the ton.

DOLLY VARDEN.—This mine ie on the southeast slope of Treasure Hill. A hunch of fine ore was found by one of the owners, by accident, a few days since, which assaye $30 to $40 to the ton. Active operations will begin the coming week.

EAST SHEBOYOAN.—The Exchange and Regent drifts show fair milling ore. Supt. Rogers commenced shipping ore to mill the 7th of the month.

Arizona.

ITEMS.—Prescott *Miner*, June 8: The mines around Prescott now being worked, are yielding plenty of rich ore. The Del Pasco Co. are taking out fair quantities of gold.

Placer miners on Lynx Creek are making from $5 to $20 per day. Those at work on the Hassayampa are also doing well.

Mining in Wallapai Dist ie being prosecuted with vigor and success. Both the furnaces and Hardy's mill are running. Rich discoveriee have been made in the vicinity of Cerbat.

Colorado.

COLORADO GULCH.—Cor. Central *Register*, June 12: Three Cos. will work in Frying-pan Gulch. At California Gulch all the old Cos. are at work, and some new ones. The lode minere are all husy, and with good prospects. The American Flag and Lincoln will help to swell the hnllion product thie summer. Paul & Co. intend to erect a 20-stamp mill on the Iowa Gulch, to crush Printer Boy ore. The main shaft is 280 ft. deep. The Pilot Co. have heen taking out good pay dirt all winter.

Walter Jones is working the Cash Creek Co.'s ground this season, and will succeed well.

The McNulty Gulch Co. found good pay on the side of the gulch where it wae supposed the gulch was worked out, or pay streak had run out.

TENNIS & CO. are working the Unexpected lode, in Lake Gulch. Thoir last run of ore yielded a little over 4 ozs. per cord.

STEVENS & Co. are working the Birmingham lode, and have heen taking ont qnite a low grade of ore, hut present indications are that the ore is improving in qnality.

THATCHER, STANDLEY & Co. exhibited on their counters yesterday, a magnificent sugar loaf-shaped gold retort, weighing 500 ozs., from the Leavitt mine, the product of about 65 oords of stamped ore, and worth $19 per oz. in currency. The gross product of the mine for May, $20,000.

CASCADE.—Carihou *Post*, June 13: The "D. D." lode, Cascade Dist., at 18 ft. is opening out into a splendid crevice of ore 30 inches in width. A short distance from this lode, the same parties—Dora & Dickinson—are sinking on the "Andy Johnson" lode, with very flattering prospects.

Idaho.

LOCAL RECORD.—Silver City *Avalanche*, June 13: The Oro Fino has 500 tons of ore on the dump.

THE Elmore has 300 tons out at the mine, and they are running the 8th lovel drifts from the winze with the utmost dispatch. The main shaft is down 70 ft. below the 7th level, and looks splendidly.

THE Golden Chariot hae 250 tons of ore at the mine ready for milling.

THE War Eagle is looking well both north and south in the drifts.

THE Empire shaft is down 90 ft. and the winze 40 ft. The ledge in the bottom of the shaft is 3 ft. wide, showing rich ore.

THE Illinois Central has 100 tons of rich ore on the dump.

The Omega has commenced taking out ore again.

C. S. Miller has reeumed work on the Red Jacket, and has 20 or 30 tons of rich ore on the dump.

THE placer mines all have a good head of water and are running night and day with good pay.

Montana.

ORO FINO.—Deer Lodge *New North West*, June 15: Partiee who have heen prospecting hetween Oro Fino and Silver Bow, have found fair diggings—$8 to $10 per day. Wages are $5 for whites and $1.75 to $3 for Chinese.

BLACKFOOT.—Correspondence same: Asa Brown, reports a rich discovery of gold-hearing quartz at the headof Ophir Gulch. Frank Green's flume is 1¼ miles long, with large certainties. Mining is going on vigorously.

WASHINGTON GULCH. —Correspondence same: Peter Coffey and Juo. Ferris have opened up Milk Man's Gulch, a tributary of Waehington, and are doing well. Pat Williams, Ferris & Co. are working their claims on Washington Bar, near the mouth of Left Hand Fork, and are making from $9 to $12 per day to the hand. Joe Parmantel & Co. are sluicing in the Right Hand Fork, and doing well. Tim Sinnon & Co. will commence cleaning hedrock next week. Duncan Seaton & Co. have put in a hedrock flume in the lower end of Washington Gulch, and expect to make some good rune.

DEER LODGE MINES.—Deer Lodge *Independent*, June 18: There are 12 hydraulics operating on Pilgrim Bar and something over 100 men find employment at $5 per day. Some Co's. clean up from $4,000 to $5,000 per week, and all the claims are said to pay.

Two hydraulics and 17 gronnd sluices are running at Butte, and aome of the Co's. have taken out as high as from 30 to 50 oz. per week.

About 30 men are in the vicinity of Rocker. Wolverton's new diggiugs, on McMinnville Bar, are paying handsomely.

Several hydraulice and a numher of ground-elnices are running in the vicinity of Silver Bow, furnishing employment for from 75 to 100 men.

CEDAR.—The mines at Cedar Creek are paying well.

Utah.

SHIPPED.—S. L. *Tribune*, June 20: Walker Bros. shipped last evening to the East 5 bare of silver bricke, aggregating 6,843 onnces, and worth about $7,100 in coin.

WILL RUN.—H. S. Jacohs' furnaces at Stocton, will start up inside of 30 days.

OPHIR DIST.—Work is going forward rapidly on all the mines, the Pioneer mill ie in full hlast on all the arastras running and the furnaces filling up .The large water mill power of the New Jersey Milling and Furnace Co is almost completed, together with 2 smelters in course of erection.

An immense force of men are employed on the Zella, Tiger, Rockwell and Petaluma, all combined under the one, Tiger.

Work on the minee in Dry cañon is pushed forward vigorously. Wages in Ophir Dist. ranges from $4 to $4.50 per day.

S. F. Stock and Exchange Board.

THURSDAY, June 27.

The salea at the Board for the week ending Wednesday evening, the 19th inst. were only $1,516,000—smaller than they have been for some months. The Raymond and Ely mine has sent down thus far on June account, $229,200. The Eureka Consolidated mine sent to mill, 790 tons of ore last week and 704 this week. The Eureka mine's last "clean up" was 625 onnces. The Savage mine took out last week 1,283 tons ore assaying $23.76 per ton. The Hale and Norcross mine yielded during the same period 425 tons. The Crown Point mine shipped $40,000 this week; the Meadow Valley shipped between the 8th and 14th inst. $54,000; the Pioche sent down this week $11,000, and the Sierra Nevada mine $4,900. The Crown Point mine yielded last week, 2,840 tons of ore valued at $112,000.

Stocks have fluctuated again considerably this week. On Friday they were very quiet although the market was considered firm; on Saturday the same with some advance in prices. Monday waa a bright day and the market opened strong and Belcher advanced $50 over Saturdays sales, Kentuck $70, Gould & Curry $15, Segregated Belcher $16, Yellow Jacket $6, Raymond & Ely $4, Crown Point $30, Caledonia $5, and Chollar-Potosi and Consolidated Virginia each $2, Alpha declined $1 and Savage $2. On Tuesday prices again dropped, Crown Point declining from previous morniug's sales $20, Kentuck $70, Alpha $5, Chollar-Potosi $3, Exchequer $2, Gould & Curry $2, Segregated Belcher $15, Yellow Jacket $5 and Raymond & Ely $2. Savage advanced $8, Hale & Norcross $8 and Ophir $1. On Wednesday prices were still lower, Kentuck showing a decline of $15 from previous morning's sales, Belcher $45, Chollar-Potosi and Savage each $8, Alpha $3, Crown Point, Caledonia, Hale & Norcross, Exchequer and Ophir each $2. Eureka Consolidated, Golden Chariot and Pioche each $8, Segregated Belcher $5 and Yellow Jacket $6. American Flag raised $1.50. To-day's prices show a still further decline aud the market is very weak.

Fifteen mining companies have levied assessments which become deliuquent in June, viz: Adams Hill Cons., Baltimore, Cascade, El Dorado, Gen. Lee, Hidden Treasure Cons., Ida Elmore, Independent, Justice, Minneaota, Pea Vine, Pride of the Mountain, Union Gravel, Virtue, Washington and Creole. The total amount of their assessments aggregates $220,850. Four dividends have been paid thia month, Belcher paying $312,000 or $30 per share; Crown Point, $300,000 or $3 per share; Meadow Valley, $60,000 or $1 per share; and Raymond and Ely, $210,000 or $7. This sums up as dividends $882,000; while the assessments were $220,850 which leaves a balance for the month in favor of stockholders of $661,150.

The San Francisco *Stock Report*, contains a tabulated statement of the monthly bullion product of the principal mines on the coast for the past year. Twenty-seven mines have yielded $13,355,210, while the yield of the same mines in 1870, was $7,465,000—the figurea, showing an increase of nearly $6,000,000. This is probably due to the increased yield of the Crown Point, Belcher and Savage mines, and the new income from the Raymond & Ely, Meadow Valley and Eureka Consolidated mines.

Wool Market.

We fear there is very little prospect of a rise in woola for some time to come. The next great periodical sale of wool in London takea place in a few days, and that will, as it alwaya has, govern to a great extent the prices of woola in the American market.

The demand among manufacturers is not such as to give strength to the market beyond present prices, whilst the importation of foreign wool continues at a rate exceeding former years; add to this the reduction of duties on imported wools of every grade and we have no real grounds for expecting an advance much above present rates.

THE famous Lindell Hotel, which was the finest in the United States, ie to be rebuilt at St. Louis. It will cover a sqnare 226x182 feet.

Mohair—Its Value.

The following letter from a Kentucky, Cashmere goat grower, will be read with interest by all engaged in the growing of this animal in California:

Mr. N. Gilmore, *Dear Sir.*—Your avor of the 2d iust, reached me last night, having been forwarded to me here where I have a pleasant winter home, on account of infirm health. I regret I did not receive your letter in time to seud you a communication which would embody the information which you particularly desire, aud also that the statistics which I have as to the consumption of mohair are at home in Kentucky and of course not now accessible, aud I fear to state from memory only. But I cau state a fact which will not be unacceptable nor inappropriate, viz.: the mail last night brought me a letter from Messrs. Bauendahl & Co., of 86 North street, New York City, in which they inform me they have sold the remnant of my last clip of goat's wool at 77c. per pound, (the former lot and superior wool having heen eold at 85c. per pound, jnst as it was shoru,) and also that they have an order for 1,000 pounds of mohair of ¾ blood for which they will pay 75c. per pound, and inqnire if I have any more and where they can obtain any.

If the publication of these facts will aid you in the good work in which you are engaged they are at your service.

The interest in Cashmeres is growing fast on this side of the Continent, as well as with you.

I had a pair sent to me here from home, with which to hegin to raise them here, as I am sure this State and all the piue land region of the South, ie well adapted to them.

I will retnrn home in May next, and will be well pleased to hear from you at any time, and remain with best wishee, your friend,

Robert W. Scott.

Miltonville, Florida, March 4th, 1872.

P. S.—Please refer any parties who raise mohair, to Messrs. Bauendahl & Co., who have eold several clips for me satisfactorily, and they can do hetter with it than anyone else. The manufacturers should he sustained and supplied when they call for wool, as their demand will he the hest encouragement to raising it.

Gold and Silver in the Red River Country.

Reports are current of remarkable discoveries of gold and silver in the Red River country. What they amount to, will scarcely be known for some time to come. We may expoct during this summer to hear, if we hear anything, the usual alternation of glowing eulogy and disgusted depreciation, acoording to the interests or temperaments of those who originate the reports. At present, the sanguiue view predominates. "One of the oldest explorers of the Lake Superior region" is of the opinion that the silver discoveries will go far to surpass the Silver Islet mines. Considering that Silver Islet is one of the half-dozen richest deposits in the country, this prophecy is tolerably etrong. Why is it that "old explorers" invariably tell the higgest stories, and seem to believe them to? Possibly one reason is, that no one pursues that business steadily unless he is constitutionally hopeful. Hope, pork and beans are the sustenance of the race; and so all old professional prospectors are sanguine, because those who are not so give up the occupation, or die young. We are not inclined to find fault with a peculiarity which lends so much power to the advance of civilization; and though we do not clearly see that promised rival of Silver Islet, we trust the pioneers who are pressing into the Red River country will not give up the search until they find their treasure, or "know the reason why." It may comfort them to remember that there are many degrees hetween Silver Isletand "no pay;" and somewhere on that long scale, they may find a satisfactory, if not an incredibly gorgeuos reward of their perseverance. — *Engineer and Mining Journal.*

Mt. San Bernardino.—The *Guardian* puhlished an account of the ascent of this famous mountain hy W. A. Goodyear, of the State Geological Survey, one day reoently. It took half a day to ascend from the hase of the mountain, a distance of six miles. He was accompanied hy Mr. Frank Thomas as guide. They remained on top of the mountain ahout three hours. The height of the mountain was estimated at 11,000 feet, and it was extremely cold on the summit, the thermometer indicating 32°. The gulches toward the top were filled with snow, supposed to he 20 feet deep. An adjoining peak was pronounced 800 feet higher.

The culminating point of the Mont Cenis Pass, huilt hy order of Napoleon I., reaches an elevation of 6,775 feet above the level of the sea.

El Espirito Santo.

In 1826, Henry Barnard, Esq., then residing n Truxillo, Peru, eent to Richard Harrison, Esq., of Liverpool, England, the bulb of a remarkahle parasitical, orchidacioue plant, which he had found in the neighborhood of Panama, where it wae looked upon with much consideration, and known ae *El Espirito Santo*—the Holy Spirit; but which had never been seen in the conservatories of Europe. The hulh was properly cared for, and soon began to put forth leaves, hut leaves only, until 1831, when it shot up its first flower stem, which sprang from the base of the bulb, while its leavee grew from the summit.

It was not until the blossom appeared that the significance of its local name was apparent. When the flower had fully opened, a most singular and heantiful appearance wae presented. The fructifying column in the center of the flower, with its surmounting anther and the projecting glands of pollen-massee were observed to present a striking resemblance to a dove—the emblem of the third pereon in the Holy Trinity. Hence the name, *El Espirito Santo*—the Holy Spirit—wae reverentially applied by the native residents, from the same religious feeling which had prompted the name of the "passion flower."

The form of a dove assnmed by the parte of this flower, as described ahove, are remarkably true to natnre. The breast, the extended wings, the head and heak, and even two purple dots for the eyee, are all distinctly shown, and almost as true to nature as the art of man can depict them.

Owing to the great heat required hy this plant, and its peculiarly delicate construction, it has been found very difficult to cultivate it, artificially, away from its native region, which is comprised withiu the central portion of the torrid zone of the Western Continent.

Some two or three years since, as Mr. Shuman, the chief florist at Woodward'e Gardene wae crossing the Isthmue of Panama, he took the opportunity to make a collection of some of the most characteristic tropical plants obtainable in that locality, and among othere was a specimen of the *Espirito Santo*, which still occupies the portion of the native wood upon which it was found—for it is a semi-parasitical plant. Under the excellent care and management of Mr. Shuman, with the very superior facilities furnished hy Mr. Woodward, the proprietor of the gardene, for the cultivation of tropical plants, this epecimen, after continuing in vigorous growth for two years, threw np its first flower etem.

ESPIRITO SANTO—HOLY SPIRIT FLOWER.

Both the flowere and leaves, with the distinct ive dove repreeentation within the center of one of the flowers is shown in the accompanying illnstration, which has been engraved from a photograph taken of the eame while at the hight of its show. The bulb, from the tops of which the leaves grow and from the base of which the flower stem springe, is not shown; hut the leaves, flowers and upper portion of the flower etalk is distinctly shown.

Five leaves spring from each bulb, from twenty to thirty inches in length, hy five or six in breadth—lanceolate in form. The flower stem grows from three to four feet in hight, bearing npon its summit a spike of globose, fleshy, yellowish-white flowers, yielding a very peculiar and delicate perfume.

The flowering of this plant attracted much attention and a large number of visitors to the gardens last season. It is expected that it will flower again this eeason. A carefully prepared representation of the flower was made in wax, at the time, hy Mrs. A. O. Cook, of 304 Mason street, which may be eeen in a small vase just to the left of the front entrance to the rotunda mueeum. Copiee of the same have also heen made, and are in possession of eeveral persons in the city. In its native clime, (Central America) this plant blooms just at the commencement of the rainy season, and, of course, just after ite annual period of rest. The flowers hold on ahout one month. It is now known to hotanists as *Peresteria alata*, and is figured in vol. 5, (new seriee) of *Curtis' Botanical Magazine*, (No. of Engraving 3,115). The plant helongs to the order of *Orchidacea*, a class of plants of wide distribution, occupying in some of its varieties almost every portion of the earth from the equator to almoet the extreme northern and southern limits of the poles. It is only, however, ae we approach the equator that the varietiee of this plant assume peculiar or beautiful forme. There, owing to the peculiar condition of the column, the anther containing the pollen, and the often remarkahle development of some one or more of the inner leaves or petals into nnueual forms, the flowers frequently take the most singular and sometimee beautiful or fantastic forms. An insect, or a spider, a hutterfiy, etc., sometimes a hird, as in the *peristeria alata*, not unfrequently a reptile, and sometimes a helmet with visor closed or raised, and often other singular and most heautiful forme are eeen.

Sometimee there is a peculiar sensihility connected with the flower, which makes it a most effective insect trap, so hinged that it immediately entraps and holds fast any insect which may alight npon it, when its size is sufficient to enclose such intruder.

The particnlar specimen at Woodward'e and which ie herewith figured, is a psuedo-bulbous epiphyte plant—having the appearance of a hulh, hut not a real hulh, and growing upon other plants hut not penetrating their suhstance, nor absorbing their juices, ae is the case with a real parasite. This variety is also eometimes found growing upon rocks or upon the earth, generally choosing dry, hilly localities. It grows well artificially in turfy peat or rotten wood. It is thus kept at Woodward's, where it is eeen in a rustic hanging basket.

Standard vs. Narrow Gauge.

Gen. Haupt writes an article on this sub ject for *Van Nostrand*, in which he allows for the narrow gauge in comparison with the wide gauge three advantages: —Slight saving in weight of axles and cross-heams, and an equal addition to paying load; saving in cross-ties, road-hed and hallast, of say $500 per mile on an average; saving in cost of construction consequent upon the use of sharper curves. "These savings can only he determined in each case hy a comparative estimate based aon ctual location, but they will not amount in the aggregrate 10 per cent. of the savings claimed by advocates of the narrow gange."

But how are the two gaugee compared. The writer tells us. "It is not fair," she says, "to compare narrow-gauge railway? equipped with light rolling stock with the standard gauge on which necessarily heavy engines are used, and credit the saving entirely to narrow gauge." A fair comparison, so far as the question of gauge is concerned, would he to put the light engines and cars upon the standard gange, and then note the cost of construction and operation."

That is to say, it is not fair to compare the two systems *as actually built*, hut to compare the narrow gauge road with a theoretical one of broad gauge. Of course any such comparison is of no value to our people. The question is simply this;—can we build narrow gauge roads where broad gauge is too expensive? No one proposee as yet to huild one of these theoretical broad gauges, while many assure us of the feasihility of the narrow gauge. The hest of the argument for our conditions is decidedly with the narrow gauge advocates thus far.

Nickel Mines in the United States are attracting attention as promising handsome returns. The only such mine now worked is in eastern Pennsylvania, and it pays well. One mine on the Mine-la-Motte tract, Missouri, was worked from 1850 to 1855. The ore was the sulphuret, aseooiated with lead and copper. Ahout $100,000 was realized from the croppings of the vein. Croppings of nickle ore are fonnd also in Madison, Iron and Wayne counties, Missouri. The refined metal is worth ahout $3 per lb., and for many pnrposes supplants silver.

Geological Snrvey in Montana and Utah.

The Salt Lake *Tribune*, of June 17th, reports the arrival of Dr. Hayden, U. S. Geologist, at the camp of his party at Ogden, and that the snrvey will soon hreak camp and commence their explorations. Dr. Haydeu, with a chosen few, will take the stage for Fort Ellis and fit out his expedition from that post. His oorps is organized as follows: Dr. Hayden, Geologist; in charge of the whole expedition; Mr. Savage, Assistant; Mr. Logan, Secretary. Mr. Beckler, Topographer; Messrs. Gannet and Wakefield, Astronomers; Dr. Peale, Mineralogist; Mr. Holmes, Artist; Messrs. Platt and Greve, General Assistants. This hranch of the survey will proceed up the Madison Valley from Ellis to Fire Hole hasiu, the land of the Geysers, and will make a thorough investigation of those wonderfnl physical phenomena. The main hranch of the party, under the management of Mr. Stevenson, the Doctor's long-tried assistant, consists of Messrs. Burch and Herring, Topographers; Messrs. Eastlake and Nicholson, Meteorologists; Adams and Coulter, Botanists; Mr. Jackson, Photographer; Mr. Campbell, Assistant Photographer; Professor Bradley, geologist; Mr. Carrington, icthyologist; Mr. Jacohs, naturalist; Mr. Merriman, ornithologist; Mr. Spencer, guest of the party; Messrs. Beveridge, Brown, Jones, Negley, Taggart and West, general assistants. This section of the snrvey will proceed to Fort Hill, where, ahandoning the wagone, etc., they will push up Snake River Valley and through the difficult country of the Tetons. Colonel Reynolds essayed this feat in 1360, hut was obliged to retire. The parties will join in Madison Valley, thus making a complete geological and topographical survey of a vast region hitherto nnexplored. Congress has appropriated $75,000 to accomplieh this work, and reserved 3,000 square miles adjoining Yellowstone Lake to he held as a puhlic park forever. This is a handsome recognition of Dr. Hayden's service in surveying that country last year. It is seldom that we see science and practical utility advance hand in hand. The former generally precedes the latter; hut valuahle as these surveys are to science, they are none the less so to settlers in opening up the agricultural resources of the far west and indicating the richest lands for settlement. The vast collections made by the party are turned into the Smithsonian Institute at Washington to he classified.

Will Our Mines Last?

Men in Eastern Nevada, says the Eureka *Sentinel*, have not as yet overcome the fear that before many years the mines will be worked out, and white men will have to emigrate to some more propitious land. The result is that permanent improvements are held back, men live in shells instead of houses, business is done on short credits, property is of uncertain values, and generally things are arranged as if a speedy transit were contemplated. And yet this year Nevada will ship nearly or quite one million dollars for every thoueand of her inhahitants, including Indians, Chinese, children, and the multitude of worthless, ever-consuming, non-producing hummers, that are the hane of every Nevada town. We helieve there is no just foundation for the fear that mines in limestone are not as permanent as mines in other formations. We last winter took pains to compile and puhlish statistics showing that the world over the mines in limestone had yielded richer and more permanent results than in any other formation. This trnth is particulary apparent in mines where lead and silver are combined. Our attention was again a few days since called to the same object hy meeting a gentleman from Southwestern Missouri. He informed us that the lead miues there were in limestone, as he expressed it, in a country that looked just like this, except our sagehrush. He told us further that twenty-five yeare ago there was general despondency in all that region; that the people believed their mines were exhausted: now these same mines are heing worked at a depth of 800 feet and are paying hetter than ever. We see no reason to despair; White Pine, Eureka and many other limestone districts will he paying long before the men of the present generation shall have ceased their toil.

According to what appeare to be good authority, we have paid, in the past eight yeare, $169,000,000 in freights to foreign ship-ownere or an average of $21,125,000 a year for that period.

Useful Information.

How Birds are Taught to Sing.

Each kind of bird sings its own peculiar notes, but all may be taught to sing regular tunes. The mocking-bird and thrush learn tunes without training. But, by a regular education, other birds may become fine performers. A contributor to the *Nursery* says:

Last summer I was at a friend's house at Nahant. I rose early in the morning, and went down stairs to walk on the piazza. While there I heard, as I thought, some person whistling a tune in a very sweet style. I looked around, but could see no one. Where could the sound come from? I looked up, and saw a little bird in a cage. The cage was hung in the midst of flowers and twining plants.

"Can it be," thought I, "that such a little bird as that has been taught to sing a regular tune so sweetly!"

I did not know what to make of it. When my friend came down stairs, she told me that it was indeed the little bird who had whistled the sweet tune. Then my friend cried out to the bird, "Come, Bully, Bully, sweet little bullfinch, give us just one more tune." And then this dear little bird hopped about the cage, looked at its mistress, and whistled another sweet tune. It was so strange to hear a bird whistle a regular tune!

"Now, Bully," said my friend, "you must give us 'Yankee Doodle'. Come, come, you shall have some nice fresh seed if you will whistle 'Yankee Doodle.'" And the little thing did whistle it, much to my surprise.

My friend then told me that she had brought the bird from the little town of Fulda, in Germany, where there are little schools for teaching these birds to sing. When a bullfinch has learned to sing two or three tunes, he is worth from forty to sixty dollars, for he will bring that price in France or England.

Great skill and patience are needed to teach these birds. Few teachers can have the time to give to the children under their charge so much care as the bird-teachers give to their bird-pupils.

The birds are put into classes of about six each, and kept for a time in a dark room. Here, when their food is given to them, they are made to hear music, so that, when they have eaten their food, or when they want more food, they will sing, and try to imitate the tune they have just heard. This tune they probably connect with the act of feeding. As soon as they begin to imitate a few notes, the light is let into the room, and this cheers them still more, and makes them feel as if they would like to sing. In some of these schools, the birds are allowed neither light nor food till they begin to sing. These are the schools where the teachers are most strict.

After being thus taught in classes, each bullfinch is put under the care of a boy, who plays his organ from morning till night, while the master or mistress of the bird-school goes round to see how the pupils are getting on.

The bullfinches seem to know at once when they are scolded, and when they are praised by their master or mistress; and they like to be petted when they have done well. The training goes on for nine months; and then the birds have got their education, and are sent to England or France, and sometimes to America, to be sold.

All animals, all birds, and all reptiles—even fishes—are susceptible of culture and improvement. So are plants, roots, and fruits. And, above and beyond all, are human beings capable of almost illimitable development and improvement, both of body and mind.

How to Take Care of a Flute.

Anoint the flute thoroughly and repeatedly with pure raw linseed oil prepared by letting it remain unshaken for several weeks, when the clear oil should be poured off for use. It should be applied, inside and out, every time the flute is put away, it having been carefully cleaned from moisture for the first year, after which an application once a month will be sufficient. Pure olive oil will do better, but it must be oil of olives. On taking the flute from its case for use, the oil should be wiped out with an old silk handkerchief (cotton will do for the outside) wrapped tightly around a stick, using as much friction as possible. This will produce a burnished surface, which, besides aiding in filling the pores, adds to the mellowness of the tone. Care must be had to prevent the metal or anything other than the silk from touching the flute, and to apply the pressure equally on all sides, otherwise the bore will become distorted. To stop cracks that have already appeared, pack them full with good beeswax which has been mixed, by melting and stirring, with a small portion (say one sixth) of rosin, sufficient to stiffen but still leave it viscid; apply when cooled, and cram it in with the finger. Do not be tempted to use shellac or any rigid cement, as it will fail on account of the distention and contraction of the wood by change of temperature. It is well to pass your thumb over the cracks, filled as above, before commencing to play, the object being to smooth them down and insure their being tight, which rigid cement will not admit of.

Filing Saws.

The grand secret of putting any saw in the best possible cutting order, consists in filing the teeth at a given angle to cut rapidly and of a uniform length, so that the points will all touch a straight-edged rule without showing a variation of a hundredth part of an inch. Besides this, there should be just enough set in the teeth to cut a kerf as narrow as it can be made, and at the same time allow the blade to work freely without pinching. On the contrary, the kerf must not be so wide as to permit the blade to rattle when in motion. The points of the teeth do the cutting. If one tooth is a twentieth of an inch longer than two or three on each side of it, the long tooth will be required to do so much more cutting than it should, that the sawing cannot be done well. Hence the saw goes jumping along, working hard and cutting slowly. If one tooth is longer than those on either side of it, the short ones do not cut, although the points may be sharp. When putting a cross cut saw in order, it will pay well to dress the points with an old file, and afterwards sharpen with a fine whet stone. Much mechanical skill is requisite to put a saw in prime order.

One careless thrust with a file will shorten the point of a tooth so much that it will be utterly useless, so far as cutting is concerned. The teeth should be set with much care, and the filing should be done with great accuracy. If the teeth are uneven at the points, a large flat file should be secured to a block of wood in such a manner that the very points only may be joined, so that the cutting edge of the same may be in a complete line, or circle. Every tooth should cut a little as the saw is worked. the teeth of a hand-saw for all sorts of work, should be filed fleaming, or at an angle on the front edge; while the back edges may be filed fleaming, or square across the blade. The best way to file a circular saw for cutting wood across the grain, is to dress every fifth tooth square across and about one-twentieth of an inch shorter than the others, which should be filed fleaming at an angle of about forty degrees.—*Industrial Monthly.*

Hardening Plaster of Paris.—In many cases the rapid consolidation of plaster of Paris is a serious inconvenience; and it is said in the Paris journal, *Les Mondes*, that this may be remedied by the addition of from two to four per cent. of the root of marsh-mallow, finely powdered. With this additive, plastere, it is said, will not set for an hour at least. The mixture, moreover, becomes so hard on drying that it may be sawn, filed, or turned, and is applicable to the manufacture of dominoes, dice, and other small articles. If the addition of marsh-mallow root be carried to an extent of eight per cent., the time of setting is still further prolonged, and the hardness of the mass of plaster, when cold, greatly augmented. Such a composition may, while still soft, be rolled out on a glass slab, and thin sheets produced, which never crack in drying, and which may be afterwards easily detached, and polished by mere friction. Colors may be incorporated with the mixture, and good imitations of marble produced by careful manipulation, or the sheets or slabs may be painted upon when dry, and rendered impermeable by polishing and varnishing.

A Wonderful Spring.—Silver Springs, Fla., is one of the greatest curiosites in the South. It burst forth in the midst of the most fertile country in the State. It bubbles up in a basin near one hundred feet deep and about an acre in extent, and seuding from it a deep stream sixty to one hundred feet wide and extending six to eight miles to Ocklawaha river. In the spring itself fifty boats may lie at anchor—quite a fleet. The spring thus forms a natural inland port to which three steamers now run regularly from St. John's, making close connections with the ocean steamers at Palatka. The clearness of the water is truly wonderful. It seems even more transparent than air; you see the bottom, eighty feet below the bottom of your boat, the exact form of the smallest pebble, the outline color of the leaf that has sunk, and all the prismatic colors of the rainbow are reflected. Large fish swim in it, every scale visible, and every movement distinctly seen. If you go over the spring in a boat you will see the fissure in the rocks from which the river pours up like an inverted cataract.

How to Build Brick Chimney-tops.—All the brickwork above the superstructure, whatever the material of the building, should be made with cement mortar, which absorbs less moisture than that made of caustic lime and sand. The bricks for a chimney-top should be soaked in water for a few minutes, so that they will not extract the water from the mortar. In order to have mortar become very hard, it must dry slowly. By laying wet bricks, the mortar will set slowly, dry slowly, and eventually become almost hard as the bricks. Every brick chimney should be covered at the top with a copestone, and arched top, or bricks placed over the flues, like the rafter of a building, for the purpose of turning off the water which would go down the inside, be absorbed by the bricks, and perhaps soak through and wet the paper or kalsomining on the inside. A chimney-top made as above will stand the influences of the weather over a hundred years without repairs.—*Industrial Monthly.*

Good Health.

Times of Eating.

There is a good deal of shoddy in the popular notions and instructions about the number of times and the times of day of eating. Some people say eat twice a day, others three times, and yet others say eat as often as hunger prompts you. Civilized mankind differ very widely in different countries and different occupations regarding this matter; some people eat five or six times a day and are proverbially healthy, others, and our own among them, eat as a rule but three times and are not as healthy.

There have not been wanting legions of preachers on hygiene who have aimed at the restriction of all men to one rigid rule as to the whole habit of eating, insisting that any infringement will certainly be followed by disaster. But the only thing we have or do insist upon as a rule of eating is that there ought to be some rule and this as a rule adhered to. If a man feels better and is better with two meals instead of three let him take only that number; or if four instead of three agree with him he must be foolish to forego any of them; every man must be in some measure a law unto himself.

But we do not believe that any man can long avoid dyspepsia who does not take his meals every day *at the same seasons* respectively; he must have some regularity as to time if he would be well, and all the observations of physiology bear out the statement. At the accustomed time of a meal, the stomach and other digestive organs prepare themselves by a large manufacture of digestive fluid for their normal task whether food comes to them or not; and every time they do so to prepare to digest food without getting it, they are thereby injured. People who eat irregularly—not who eat often—are more often sick and wear out faster than they who observe regular habits.

Nevertheless, for those whose whole lives are regulated like clock work, as to the time of doing everything, it often is a good thing to break in on the routine by some change, which if often repeated would do injury. A change is a rest, and a change in our regular habits may and often does give the physical system a new life. But to follow up late suppers unless they be made a matter of every day enjoyment would be very injurious.

We know from much observation that farmers, especially the younger members of the class, are much in the habit of eating just before retiring for the night. Now if one can do this every night and be healthier by it, of course it is not to be condemned—and we are far from believing, after some lengthened study on this subject, that it is impossible that any man may be more healthy with such a habit than without it. But we do not feel certain no one can be well doing this every other night; he must make it a regular habit or do it only at long intervals.

There is one sort of a person who may profitably, if not take supper just before retiring, certainly take four meals with profit; we mean such as require a large amount of food and who at each of the three meals are apt to eat too much, feeling after eating drowsy, having much flatulence and some hours after the supper having an accumulation of acid in the stomach that makes them imagine themselves hungry and in need of food, when they have only irritated stomache. By dividing the quantity of food to be consumed daily into four instead of three portions, the stomach may be able to dispose of it in a normal manner.—*Prairie Farmer.*

Sick Headache.—The true cause of sick headache lies deep in the patient's idiosyncrasy, and is developed by a hundred different causes. The advice, then, to sufferers is to give as much tone as they can to their nerves by adopting all those methods which experience has shown to be good, and then avoid as far as practicable, all those causes which are known to excite an attack. I need scarcely describe a sick headache—how one rises in the morning more dead than alive; perfectly unable to swallow the smallest particle of food, and often perhaps actually sick; how the head throbs, and the pain increased by the slightest movement; how speaking or doing is a burden beyond bearing; how one prays to be left alone in the utmost quiet, so that he may, if possible, sleep. To other persons the sufferer looks extremely ill, very pale, dark around the eyes, and with contracted pupil. To himself his head feels hot, and the application of cold ice most refreshing. The clamminess in the mouth, the nausea and general gastric disturbances are secondary, and have no connection with any improper meal, and thus is in no way relieved by the too frequent and ignorantly administered purgative. This is not needed, and has no good result. The only remedies which are of any avail are those which act on the nervous system, such as hot tea and coffee; or, after the stomach is quieter, and the more urgent symptome have passed off, a little wine or ammonia. If the headache take more the form of hemicrania, then remedies are occasionally useful, as the local application of the bisulphide of carbon, or galvanism, and internally the bromide of potassium. This is the only drug which I have really seen to be serviceable. Whilst the nausea exists and the worst symptom prevail, even this remedy is of no avail.—*British Medical Journal.*

Origin of Disease.

Most medical writers and students now accept the humoral theory of disease. This was the theory of the ancients. During the last century, the opposite theory was entertained, and it was maintained that disease was primarily of the solid parts of the system, and that the blood and other fluids became corrupted as a consequence of disease of the solid parts. Modern experiments and research have proved the fallacy of this theory, and demonstrated that bone, muscle, nerve, *fascia*, and all other solid parts, are continually renewed by material drawn from the blood, and that these become diseased only when the blood from which they are nourished deviates from its normal healthy character. Modern science justifies the intuitions of the ancients.

In some diseases, we find the blood carrying too much, and in some too little, earthy matter; there is sometimes an excess, and sometimes a deficiency, of various elements of nutrition, and sometimes the blood is in a state of feverish, yeasty ferment. Of course, the nerves, muscles, etc., built from such blood must be of abnormal or defective organization, for a good article of any thing can be made only of good material. Therefore, in disease, our attention must be directed to purifying the stream from which the affected organs derive their sustenance. The source of this stream is the digestive and assimilative systems; and, to insure good blood, from which sound organs can be built up and replenished, it is essential to furnish good blood-making material, and that the organs for transmitting this into blood be in healthy condition. As these organs are themselves built up and their waste repaired by blood from the general circulation, the same rule applies to them as to other parts of the body.

Almost every form of chronic disease can be traced to some dietetic error. The patient has used improper food, or eaten too frequently, or in too great quantities, or the hours of work and rest have not been such as to favor perfect digestion. These errors may not have produced immediate results, and the patient may truthfully assert his present care in the choice of food and the skill with which he orders the conditions for perfect digestion. The errors were probably in years past, when he felt no ill-effect of his folly. But, during these years, the integrity of the vital organs was being steadily impaired, and their vitality depressed. The effect of this is seen in premature decay, and disease of some kind fastens upon the weaker or more outraged organs. Every person born of reasonably healthy parents, and under favorable conditions, has a stock of vitality which, properly treasured and carefully used, should insure health and vigor to the age of three-score or three-score-and-ten years. Yet one-half of the whole community, both men and women, are falling at thirty, and broken down at forty.

Wine as a Beverage—Tendency of Alcohol to Disturb Healthy Action.

In all our common articles of food, the elements of nutrition and respiration, are so nicely balanced in their proportions, that, for the diet of a healthy man, there is no necessity for adding an extra quantity either to the one class or the other; or, in other words, the supply of nutrition and of animal heat is so admirably equalized, in the composition of common food, that any material derangement of the proportions which it affords, is attended with a corresponding derangement of the vital functions. It is obvious, therefore, that if we add a portion of alcohol to the food taken into the stomach, the elements of respiration are increased and the animal heat augmented in a proportionate degree. No part of the alcohol can go to form the tissues of the body, or to renovate and sustain them, as it is destitute of nitrogen, and not an element of nutrition. It can only serve as an element of respiration, to be burned in the lungs of a man, and to add to the amount of his animal heat. The result is, that as the quantity of alcohol is increased from habit, an unnatural exhilaration is produced, leading to an overtasking of the muscular and nervous systems, and to premature decay in the manhood of the victim. To use a familiar phrase, he has "lived too fast." Let us gain a clearer view of this point by contrast. We know that an insufficient supply of food tends to produce paleness of the cheek, because both the animal heat and the nutrition are less than is demanded to keep up the healthful condition of the system. On the other hand, where age has not indurated the skin, an abundance of food keeps up the vital powers, and the face, possessing the ruddy color of health, bears testimony to a well-stored stomach. But when alcohol is added, in such a case, in excess, the nice balance between nutrition and respiration is destroyed, the healthful action of the animal functions is impaired, the ruddy glow of health disappears from the cheek, the deep red of the furnace heated by flame overcasts the countenance, and the habits of the inebriate stand revealed. Now, if pure alcohol will do all this upon a healthy constitution—and none dare gainsay its truth—how much more fatal, and how much more speedy, must be the production of the crisis, in the drinker's career, where deleterious compounds are used in its stead?—*California Culturist,*

MINING SUMMARY—Reports from mines in various States, Counties and Districts; Stock Reports; Leather and Metal Markets; Mining Shareholders' Directory, 404-405.

CORRESPONDENCE.—Schell Creek Mines; The Quick silver Mines of Almaden, Spain, No. 1, 402.

SCIENTIFIC PROGRESS.—Dr. Carpenter's Theory of Ocean Currents; Spontaneous Explosions; Gas Burners for Bending Glass Tubes; Faulty Vision in Painters, 403.

MECHANICAL PROGRESS.—A New Method Determining the Quality of Iron; The Peg Switch; Railroad Torpedoes; Road Steamers—Rubber Tires; Reducing Steam Power; 403.

USEFUL INFORMATION.—How Birds are Taught to Sing; How to Take Care of a Flute; Filing Saws; Hardening Plaster of Paris; A Wonderful Spring; How to Build Brick Chimney-Tops, 407.

GOOD HEALTH.—Times of Eating; Sick Headache; Origin of Disease; Wine as a Beverage—Tendency of Alcohol to Disturb Healthy Action, 407.

DOMESTIC ECONOMY.—The Family Table; To Collect the Odors of Flowers; To Cleanse a Stove Pipe; Pickled Onions, 410.

MISCELLANEOUS—Mohair—Its Value; Gold and Silver in the Red River Country; Standard vs. Narrow Gauge; Geological Survey in Montana and Utah; Will Our Mines Last? 406.

End of Volume XXIV.

The present number completes volume twenty-four of the SCIENTIFIC PRESS, and with the commencement of the next volume we shall again assume our former title—MINING AND SCIENTIFIC PRESS, which was first adopted in 1860, and continued some ten years in deference to the great leading industry which gave the first impetus to the settlement of the Pacific Coast. The reason for dropping the prefix of "Mining" some two years ago and now assuming it again will be more fully alluded to next week. In the mean time we would express many thanks for past favors, and solicit a continuance and increase of patronage to the end that our hands and means may be strengthened for the effort to furnish a paper which shall be a still more complete exponent of the mining and mechanical industries of the Pacific Coast. Readers are reminded that the commencement of a volume is a good time to commence new subscriptions.

A Lecture for Horticulturists.

Dr. Wm. P. Gibbons, of Alameda, will lecture on "Scale Insects" before the Farming, Horticultural and Industrial Club, at Oakland, Friday evening, June 28th. These minute pests are more prevalent upon trees on this coast than is generally known. The Dr. has made a special study of the subject, which at present is one of importance. Mr. A. D. Pryall will deliver an essay on the life of the potato and the propagation of new species of the tuber. The public are invited.

Determinative Mineralogy.

[Written for the PRESS—By HENRY G. HANKS.]

The importance of a knowledge of mineralogy to the miner and prospector, cannot be overestimated.

Gold is not the only metal worth seeking. There are many other mineral substances which the world must have, and for which it is willing to exchange gold. Many of these substances lie hidden in our hills; we walk over them without notice, simply because we do not know where to look for them, nor do we recognize them when found.

Any person of ordinary intelligence may learn to recognize the common minerals and metallic ores.

A certain knowledge of mineralogy may be easily acquired, quite sufficient for practical uses, upon which foundation the entire superstructure of the science may be built up in after life. Every prospector, millman, miner or mine owner, should make himself familiar with the general principles of this beautiful science, and avail himself of the advantages such knowledge affords.

No one should expect to become a thorough scientific mineralogist in a few months; but all may gain sufficient knowledge of the science to be of great use to them. The careful study of a few well selected books, a little practical instruction—if it can be obtained—and practice with the blowpipe, and a few tools and fluxes, will soon afford this.

Any natural inorganic substance, possessing definite chemical and physical properties is a

Mineral.

A pure mineral is homogeneous, the smallest fragment is the same both chemically and physically, as the whole. Ores and rocks are mechanical mixtures of minerals, as in granites, which is composed of three minerals, quartz, feldspar and mica.

Minerals are determined by certain tests, such as hardness, specific gravity, fusibility, electricity, polarization of light, double refraction, color of streak, color they impart to borax beads, color they give to blowpipe flame, by the form of the crystals, etc. A thorough knowledge of these properties and familiarity with the different species, constitute the science of mineralogy. The generally accepted definitions of an

Ore

Is a mixture of certain minerals, from which one or more of the economic metals may be extracted in the large way. Several hundred distinct mineral species are known to science, but many of them are so rare that they have only a scientific value.

Ores cannot be recognized by the above method, but the wonderful blowpipe will enable its skillful possessor to distinguish all the substances of which they are composed. The microscope will be found a useful auxiliary to the practical mineralogist.

Ore specimens are usually examined by a series of

Assays,

Which the knowledge of the blow-pipe enables the mineralogist to perform with great rapidity. By an "assay" is meant the determination of a single constituent.

Thus we may first look for sulphur. This is done by fusing the pulverized ore in a cavity on charcoal, with pure carbonate of soda. The slaggy mass obtained by this operation, is placed on a piece of polish silver and moistened with a drop of water. If sulphur is present, a black coloration is left on the silver. Such a reaction would decide the ore to contain a sulphide or a sulphate, unless silenium was present, which would be recognized by the smell.

Copper

Is found by wetting a small fragment with hydrochloric acid, and heating it in the outer blowpipe flame. An intense blue color indicates copper. All ores of

Lead

Give white malleable metlalic beads before the reducing blowpipe flame on charcoal, either with or without fluxes. The resulting bead when placed on a clean piece of charcoal and blown softly across the support, produces an incrustation which is yellow, both hot and cold.

Silver

Beads may be obtained in the same manner, but do not give yellow incrustations and always remain brilliant and white, even when heated by the oxidizing flame.

Gold is best found by washing down a quantity of the ore containing it, closely examining the residue of black sand and sulphurets which usually remains. If further examination is necessary, the gold may be collected by mercury and melted on charcoal into a bead. If it is gold it cannot be oxidized nor will any single acid attack it.

Mercury

Is recognized by yielding metallic globules of that metal in the upper end of a closed tube when any ore containing it is heated with carbonate of soda in the lower part.

Iron

Is distinguished by its being magnetic either before or after strongly heating it, and by the color it imparts to a borax bead held in a loop of platinum wire.

Bismuth

Is known by some peculiarities of its incrustation before the blowpipe, and by the action of water on its acid solution, by which a white precipitate is thrown down.

Cobalt, Chromium, Manganese

And some other metals are known with certainty by characteristic colors they give to beads of borax and microcosmic salt.

The study of the properties of minerals is extremely interesting, and to those who pursue it, it has a rare fascination.

Formerly minerals were described and classified by their form, color, mode of fracture, etc., as shells and fossils are still classified. The diamond, the ruby, the sapphire and other gems formed a group by themselves, while now, having been found to be carbon, the diamond is classed with mineral coal, jet, and graphite.

Minerals Possessing Similar Chemical Characteristics

Are in modern science placed side by side. Thus the simple elements form a distinct group. The carbonates, the silicates, the oxides, the chlorides, the sulphides, the sulphates, etc., form classes or groups. These are subdivided from other peculiarities, as in the case of the silicates—which form a large group—those containing water (hydrous) and those which do not (anhydrous) are the first subdivisions.

The most recent works on mineralogy are so arranged as to form of themselves tables of mineral species for reference. Thus, if the student is sufficiently skilled in determinative mineralogy to decide by experiment, that a mineral is a

Carbonate,

He will turn to that part of the work descriptive of carbonates, and will find that this class is subdivided into hydrous, and anhydrous

Carbonates.

A simple test will reveal the presence or absence of water. If water is found, he may reject all those species which are set down in the anhydrous division, and seek for a description among the hydrous species. But as this mode of determination has many disadvantages, tables have been constructed, which by a multiplicity of subdivisions, so reduce the number of species in the subdivisions as to render the final determination comparatively easy.

[Concluded next week.]

Cincinnati Industrial Exposition, 1872.

We have received a beautifully printed pamphlet of fifty-six pages, containing the list of officers, rules and premium list for the Third Cincinnati Industrial Exposition, which will open on the 4th of Sept. and continue—Sundays excepted—till Saturday evening, Oct. 5th. Five large buildings will give seven acres of covered exhibiting space. Many new features will be presented in the Fine Art, Natural History, and Horticultural Departments. Most liberal premiums are offered and in every respect it promises to be the most comprehensive and perfect Industrial Exposition ever attempted in the United States.

THE KIMBALL Car Company have recently turned out from their shop an elegant palace street-car for the City Railroad Co., which is intended to run from the Grand Hotel to Woodward's Gardens. It will hold 25 persons, and the interior is furnished with California laurel. It is handsomely fitted up with plate-glass windows, damask curtains, mirrors, handsome cushions, carpets, etc., and the roof is beautifully frescoed. The Kimball Car Co. deserve great credit for the style of their work, as does Mr. Woodward for putting such an elegant "turn-out" at the service of the public.

THE FIRE in the Amador mine was still burning on the 22d inst., and heavy caves in the shaft are said to have occurred.

Root's Wrought-Iron Sectional Boiler.

We gave an illustration and description of this boiler in the SCIENTIFIC PRESS of May 20, 1871, and a working model of it may be seen at the Pacific Iron Works, First street, in this city. One of the boilers will arrive from the East by next steamer, which will be set up at the same place for public inspection. The boiler is about to be introduced on this coast by Capt. Holdredge, agent of the company manufacturing them.

One great advantage it possesses lies in the facility with which it can be transported in rocky or mountainous sections of country, owing to its light weight. The working portions is composed entirely of wrought iron boiler tubes which are tested to a pressure of 500 pounds per square inch. The size of the boiler makes no difference in this respect since they are all composed of a greater or less number of the same parts uniform in size and strength. It presents great facility for examination, cleaning and renewal. It furnishes dry steam and is a very rapid generator.

This boiler was among the first introduced to obviate the danger in the use of the old fashioned shell-boilers and carries a high pressure, with at the same time, great economy in fuel. It is claimed that by its use there is much less danger from explosion than by the old style and that the insurance is much less than when the others are used. It can be transported on mules, to mining districts in regions where roads are unavailable. The iron tubes are constructed so as to bear 45,000 pounds per square inch, textile strain, across the sheets, their small diameter permitting them to stand great pressure. It is said that the boiler possesses great durability and permits enlargement or reduction of size, without disturbing foundations or sidewalls. The principal advantage claimed for it is its safety from explosion, secured by the sub-division of water and steam into small compartments and small diameter of the tubes combined with great strength. We advise all who are interested in any way in steam and steam boilers to go and see the Root boiler, when it arrives, or the model which is now on exhibition at the above mentioned foundry.

RECEPTION TO DR. LOGAN.—Dr. T. M. Logan, one of our Sacramento correspondents, and an early and highly respected physician of that city, was made the recipient of a complimentary reception, attended by a banquet, on the occasion of his recent return from Philadelphia, whither he had been to represent the medical fraternity of this State at the late National Medical Convention. The reception was given by the Sacramento Society for Medical Improvement, and was largely attended. The address of welcome, by Dr. Hatch, President of the Society, and the reply of Dr. Logan, were both well conceived, and most appropriate to the occasion. We regret that their length, and the crowded state of our columns, will not admit of their insertion in the PRESS. Several appropriate toasts were given, and duly responded to. The occasion was really a feast of reason and a flow of soul. As an evidence of the estimation in which Dr. Logan is held by the members of his profession at the East, we may remark, that the Doctor has been chosen President of the American Medical Association, by the Convention, to which he was accredited, and whose duty it is to name that officer.

POSTAL CARDS.—The system of correspondence by postal cards which has been for some time in vogue in Great Britain, has now been introduced into the United States. These cards are simply an open card, ruled on one side for the address and on the other for the letter. The address side has a place for a stamp and both card and stamp cost only one cent. For ordinary communications where no particular secresy is required the system is a good one and will no doubt be extensively used.

MARIPOSA ESTATE.—It is said that work has again begun on the mines of the famous Mariposa Estate. A number of Chinamen are taking out ore from the Pine Tree and Josephine mines in Bear Valley, and the Benton mill—90 stamps—is crushing ore. The new work will employ about 1,000 more Chinamen, it is said, and some 200 white men as foremen, mill hands, teamsters, etc.

MINERS are wanted in most all of the mining districts on the coast.

Our Home Industries.

Silver Plating Works of Haynes & Lawton.

No one who has occasion to pass the corner of Market and New Montgomery streets, can fail to be attracted by the magnificent display of plated ware to be found in the establishment of Messrs. Haynes & Lawton, and but few there are, who would at first sight imagine that the beautiful and artistic specimens of plated ware there to be found, are the product of the skill of San Francisco citizens. This is, however, the case, and proves conclusively, that if the Pacific Coast is one of the greatest silver producing regions of the world, that its cities are destined at no distant day to become the principal centers for the manufacture of gold and silver ware.

The work carried on here, is of two principal kinds; to-wit: the plating of White or Britannia Metal, and the

Plating of Amalgamators

For quartz mills. This branch of the business is that which is destined ultimately to become of most importance. The immense extent of the mines of the Pacific Coast, and the enormous aggregate of capital invested in them, render it of the first necessity to possess some method of preventing the escape in the process of extraction of fine particles of gold. More gold is lost through imperfect processes of extraction, than any one is aware of. The copper plates commonly used for amalgamation, require to be treated constantly with cyanide of potassium, to prevent the oxidation of their surfaces, and the consequent escape of the amalgam in passing over them. But it has not been found possible to prevent oxidation entirely by the use of unprepared copper-plates; for this purpose it has been found necessary to have them plated with silver, which has an affinity for the amalgam, and retains it.

The Process

Is the same for plating amalgamators as it is for plating ordinary Brittania ware, the only difference being that for the former a stronger solution and a larger bath have to be used. The raw silver is prepared by cutting it down with acid, by which it is reduced to a fine powder. It is then a chloride of silver, and is reduced to the state of pure silver, by precipitating it with common salt, and washing it in clean water. The articles to be plated are first cleaned by immersion in a kettle of boiling potash where they remain ten or fifteen minutes. They are then rinsed off and scoured and are removed to the solution baths which are elliptical in shape. Of these there are three for plating articles of domestic use, and one for plates. The former holds seventy-five gallons and the latter holds one hundred and fifty gallons. The solution is made of the prepared silver previously described, of cyanide of potassium, and of clear water in the respective proportions of 1 oz., 1 lb., and 1 gallon. Into one of the solutions, which is termed a striking solution, inasmuch as the article receives a coating instantaneously, the articles are first dipped; they are then removed to a second and finally to a third in order to receive a heavy enough coating. This process takes from eight to ten hours. Amalgamators are only treated in one solution, which as we have already intimated is made peculiarly strong. The proper thickness of coating is obtained by the use of Smee's batteries, of which there are ten in the establishment. Two are used for each of the small baths, and three for the large amalgamating ones. From them a circuit is formed round the bath, and to two poles or rods, connecting with them, are hung a series of wires. First pole is on the edge of the bath and has plates of silver one eighth of an inch in thickness depending from the wire attached to it. The other is placed across the top of the bath and has the article to be plated attached to its dependent wires. The first pole is called the positive, the second the negative. A current from the battery dissolves by degrees the silver plates attached to the positive pole and passing through the solution forces it on the articles depending from the negative pole. This is the whole process. Amalgamating plates having received the solution are finished, but spoons, teapots, knives, etc. have to be burnished.

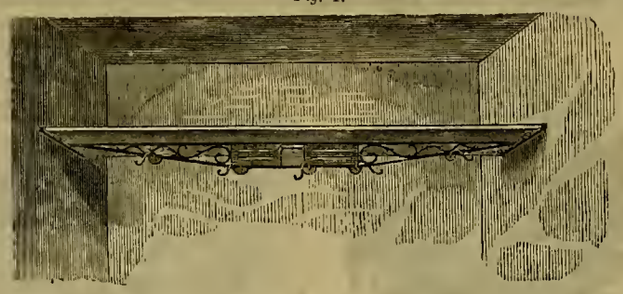
Other Facts.

The amalgamating plates which are used by the principal companies on the Coast, are of various sizes, generally from three to four feet long by one foot wide, but one has been plated recently, of the dimensions of four feet by four and a half. They will stand a year before wearing out. The cost of plating is about $5 per square foot. The other plated articles can be used five or six years without replating. There is used here on an average about 140 ozs. of silver per month, one third of which is required for the amalgamators. But this statement gives only a very faint idea of the real value of the manufacture as the labor, etc., make up the principal cost. The works have been established over four years, and are under the superintendence of Mr. Shipman who came from the East to superintend them.

Hanging Bracket and Adjustable Shelf.

The object of this simple and useful invention, is to supply a want which has long been felt in every well regulated household, namely; —an adjustable shelf which can be readily

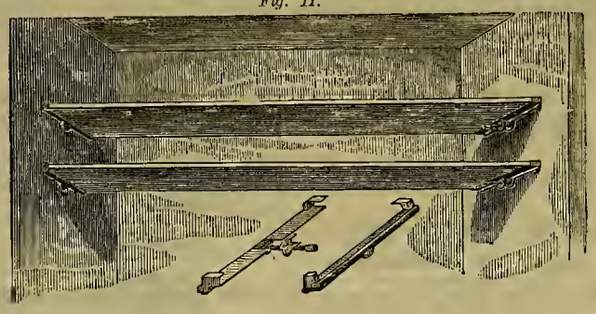
Fig. I.



raised, lowered or removed without either the assistance of a carpenter or carpenters' tools, (which are so seldom to be found in every house when required,) also a drop or hanging bracket to be attached to the adjustable shelf, or to be used independently under a horizontal surface, such as a low ceiling, an ordinary shelf, etc.

Before describing the above inventions, we will give a brief description of their capabilities and merits. The adjustable shelf will prove

Fig. II.



invaluable on book-cases where they can be easily lowered or raised according to the sizes of books; in pantries and drawers as a security against the collection of vermin, as they can be removed and washed; to papered or hard-finished houses they are particularly adapted, not defacing or injuring the wall in the slightest degree, dispensing entirely with the use of nails, and affording the paper hanger or whitener facilities for working, which no other arrangement of shelf can possibly present. In changing dwellings it can be removed without difficulty. Some of its forms can be adapted either to recesses or projections, for hanging signs, cornices, etc., and when erected with any of the many forms which the drop will take, will make a complete wardrobe.

In stores, show cases, country houses, ships' cabins, office closets, and wherever space is limited, it would almost be impossible to overrate the value of this combination. The hook alone, is as protean in its adaptabilities as the adjustable shelf. It can be used equally as well on vertical or horizontal planes, without injuring its surface, with one or many drops, either revolving or stationary, and will serve as a substitute for hat racks, clothes-horses, meat hooks, or revolving dryers in laundries, and a thousand other household purposes too numerous to mention. Its simplicity is shown in the following description and accompanying cuts.

Figures 1 and 2 represent the improved extension shelf. The form shown in Fig. 1 is composed of two light iron arms or trusses suitably ornamented and having at their ends sockets extending along the ends and at right angles to the arms, sustaining and clutching the board which forms the shelf. The outer side of the sockets are grooved to contain rubber or any other elastic material, so that the rubber will rest against the wall. A sliding device operated by a screw at the center, where the arms are placed between the projections of the wall forces the rubber at each end against the wall, firmly gripping it, supports the shelf. Numerous hooks can be cast on these arms for supporting various articles. Fig. 2 shows a modification of the above device, in which the sockets are cast to fit the board for forming the shelf, the rubber being placed in the outer groove as before. One of the sockets is provided with a clamp and set-screw, the clamp working against the board and the set-screw against the socket. By turning the screw the rubber is forced against the wall, the shelf sustaining all the weight the board will support.

Figures 3 and 4 show two forms of the patent drop or hanging bracket used for supporting various articles. Fig. 3 represents a drop suitable to a horizontal surface. A conveniently-shaped hub is used, having a screw at one end for the purpose of attaching it to the ceiling, etc., the sides of the hub containing any number of slots or dovetails, into which the hooks are inserted so as to project at any angle required. The hub may swivel on the screw and the arms project all around,

Fig. IV. *Fig. III.*

and by this means any article may be turned conveniently to the person requiring it. Figure 4 is a modification of the above, suitable to a vertical plane standing at right angles to the wall, etc., and can be used with any number of hooks. This is designed to take the place of the ordinary clothes-hook, over which it has numerous advantages. Further information concerning this patent can be had of S. N. Bliven & Co., (under the What Cheer House, Sacramento street) who are the agents for the sale of it.

Mining Patents. — United States Patents have been received for the Little York Water and Mining Company's claims, and the Picayune Mining Company's claims, in Nevada County.

The Miners strike at White Pine has been satisfactorily settled, and all the mines that suspended work have started up.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

FOR THE WEEK ENDING JUNE 11TH.

Grain Cleaner.—John H. De Force, Healdsburg, Cal.; antedated June 7, 1872.

Griping-Pulley.—Andrew S. Hallidie, S. F.

Bedstead-Fastening.—Seneca Jones, S. F., Cal.; antedated May 23, 1872.

Rock-Drilling Machine.—Asahel J. Severance, S. F., Cal.

Wind-Wheel.—William I. Tustin, S. F., Cal.

Attachment for Whiffletrees.—James T. Williams, S. F., Cal.

Oyster-Nursery.—Benjamin F. Lyford, S. F.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press, American and Foreign Patent Agency, the following are worthy of mention:

Improved Baling Press.—F. A. Huntington and J. F. Carter, San Francisco, Cal. This press is intended for baling hay, straw, wool, cotton, or other balable substances. It consists mainly in the combination of a single horizontal baling-chamber with a follower, which is operated by a toggle or knee lever without the intervention of any gearing or other machinery. It also consists in a novel construction of the sides of the chamber and the end door and its fastening, for strength and facility of discharge. The chamber for holding the material to be baled has an end door having a flange or rim so as to inclose and hold securely the sides of the chamber, which are slightly beveled; when closed this flange incloses the side and top walls of the baling chamber. The walls of the chamber may be either elastic or hinged a short distance back from the end so as to separate easily to allow the bale to be removed. The door is secured by a hasp on one side and a sort of cam-lever on the other. The latch hooks on a small projecting catch on the lever, when it is standing out from the body of the press; and by drawing the lever down against the side it draws the latch tight and secures the door. The follower is made so as to move easily in the chamber, and has guiding bars at the sides. A lever is hinged to the center of the back end and extends out to a point where it is pinned to the end of another lever.

Machines for Concentrating and Amalgamating Ores.—W. T. Rickard, Monitor, Alpine Co. Cal. The invention consists of a horizontal tank, cylindrical in form, through which a central shaft passes. V or X shaped plates are secured upon this shaft so as to swash the contents of the tank back and forth as the shaft is revolved. The plates may be amalgamated if desired. The machine can also be used as a churn if desired, the same motion being suitable for converting the cream into butter.

The Text of Interesting Decisions in Patent Cases.

DECISIONS OF THE COURT.

U. S. Circuit Court, Southern District of New York.

S. F. DAY AND H. A. MANN vs. BANKERS' AND BROKERS' TELEGRAPH COMPANY.—In Equity. Decision rendered January 20, 1872.

Patent of S. F. Day for Improvement in Electro-Magnetic Telegraphs — Mere Change of Degree not Patentable.

The combination, in an indenting telegraphic registering instrument, of a sounding-box, a lever, and a sounding-post, so arranged that the blow of the armature will be struck directly toward the box (which forms the subject of the second claim of S. F. Day's reissued patent of March 23, 1869), is applicable as well to a local current produced by a local battery as to a main line current where a local battery is not used.

As the use of the arrangement in a local current would be an infringement of the claim, the prior use of the arrangement in a local current is an answer to the claim.

Such a combination was in use in the "Chester sounder" as a successful practical telegraphic instrument before the invention of Day.

A small box having been used in a local circuit for making the sound produced by the stroke of the armature more audible: *Held*, that to increase the size of the sounding-box for use in a main line circuit, so as to secure a larger volume of sound, was an obvious change, and was not an invention. The difference is one merely in degree, not in patentable substance.

Base Bullion.—There was received at Los Angelos on the 24th inst. 434 bars of base bullion from Cerro Gordo for San Francisco.

DOMESTIC ECONOMY.

The Family Table.

Of all the familiar features of the family there is noue that posseeses a greater interest or greater capacity of coutrihnting to the household happiness, than the table. It is the prime unitcr—the first and chief prompter of that nnity which makes the family the integer of hnman organization. It wields a more than patriarchal authority. The father's commands may he forgotten; the mother's wiehes thoughtlessly disregarded, hut with its white cloth, the table is a power which is never resisted or slighted.

The members of the family may be scattered in different places—somo at the counting honse, some at the work shop, eome in the forest, in pursuit of pleasure or duty. The magic of the white cloth reaches them wherever they are, and its mute invitation summons them home. And even when the family is shattered to fragmente and scattered over the whole earth —when each departing member has become the head of a different family, that unforgotten picture of a white cloth and the tea-urn will still assert its power, and gather the wanderers from the distant land to joyous thauksgiving under the old roof tree.

The family board should he honored of all, where churlishnese, coldness, silence and frowns should have no place. It may he made thrice a day the scone of a festival richer and rarer thau picnics in wooden groves or sumptuoue feasts in gilded saloons. Its offering may be frugal and humble—hut no matter; better is its dinner of herbs, if flavored with love and spiced with vivacity, than the rich courses of a grand hotel, where strauge huudreds ewallow and gulp amid a clatter of dishes, regardless of each other's presence, or the wearv and monotonous meale of the boarding house, where the people knew each other too well to be entirely reserved, and too little too he familiar. Each aesemblage round the family table has its peculiar charm, aud each may be made a feast.

The tahle is no place for stiff dignity, or austerity. Biting bread and butter, and taking soup from a spoon may he done pleasantly and gracefully; hut to infuse dignity aud stiffnese iu the operation is inexcusahly ridiculous. Hnnger is a leveler, and eating and drinking is one of the most delightful pleasures. No one has a right to disguise the iunocent satiefaction of it at tho family board, hy the affectation of an exemption from so human a weakness ae an appetite or disdain of the viands set before him. The pleasantest family picturee are those cheerful dining-room assemblages, where father, mother, brother, sisters eat and drink cheerily, as though it did them good, aud cloth, urn, dishes and spoons seem to look happy in general joy.

To Collect the Onors of Flowers.—Roses, and all flowers containiug perfumed oils, may he made to yield their aromatic properties hy steeping the petals or flower leaves in a saucer or in a flat dish of water, and setting it in the sun. The petals should be entirely covered with the water, which, hy the way, should he soft or rain water. A sufficient quantity should be allowed for evaporation, and the vessel should be left undisturbed a few days. At the end of this time a film will be found floating ou the top. This is the essential oil of the flower, and every particle of it is impregnated with the odor pecnliar to the flower. It should be taken up carefully and put in tiuy vials, which should he allowed to remain opeu till all watery particlce are evaporatcd. A very emall portion of this will perfume glove-hoxes, apparel, etc., and will last a long time.

To Cleanse a Stove Pipe.—Raise up the bottom of the pipe, where it is attached to the stove, and hurn it ont hy inserting half a newspaper saturated with coal oil, and the soot will givo very little tronhle. A pipe more than twenty feet long is thns cleared out in an instaut. It should he done when there is very little fire In burning wood a large quantity of water settles in the pipe, especially, if the weather is very cold, and the pipe is horizontal. Thus water sometimes mixes with the soot and forms a paste, which is often troublesome and cannot be hurned out as ahove. In such cases, the only way is to take tho pipe down and release it by slightly thumping the pipe in the usual way.

Pickled Onions.—Choose the small, white round onions, take off the hrown skin, have a stewpan of boilng water ready, and then throw in as many ouions as will cover the top; as soon as they look clear on the outside, take them up as quick as poesihle with a slice, and lay them on a clean cloth, cover them cloee with another, and scald eome more and eo on. Let them lie to he cold, theu put them in a jar, or glass, or wide-mouthed hottle, and pour over them the best white pickling vinegar, just hot, not boiling. Whea cold, cover them; should the outer ekin ehrivel, peel it off. They must look quite clear.

Daying Beef. — It is stated that flies can be kept from beef hung up to dry, in warm weather, by the use of hlack pepper. Heat a ehovel red hot and eprinklo the pepper upon it. The smoke will rout the flies at once. Follow this up three or four days, as occasion may require, and the flies will give it up.

STEPHENS & CO.,
MANUFACTURERS OF
U. S. STANDARD BOXWOOD AND IVORY RULES.

ALSO EXCLUSIVE MANUFACTURERS OF
L. C. Stephens' Patent Combination Rule.
This cut represents the Combination Rule, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.
It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.
The Square is adjustable, and can be tested and made perfectly true hy the aid of a small screw-driver, hut this is seldom required.
In its application as a Slope Level it is especially adapted for Miners' use, as it shows the pitch to the foot, and degree of inclination at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.
"By the use of ono of these, a builder, mason, carpenter, or other workmen, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—*Scientific American.*
Price bo mail, prepaid, $4. For agents' terms, address

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to he the only good Sauce.
Caution Against Fraud.
Tbe success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets baving been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which tbe names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may he infringed.
Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, hottle and stopper.
Wholesale and for export hy the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-eow-tf

BURLEIGH
ROCK DRILLS
AND
AIR COMPRESSORS.
The Burleigh Rock Drills, which have stood the test of five years constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunnelling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground, or compressed air when under ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "sir motor" for the many purposes to which it is now being applied.

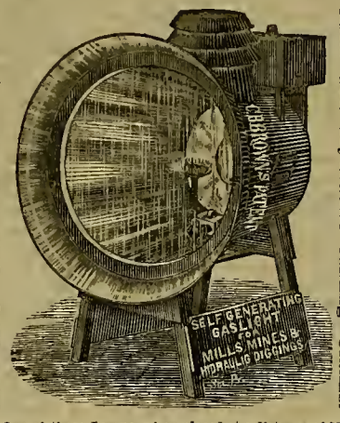
BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for upwards of 4 years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility, having no cams nor complex Rotary Arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand-work whatever. The Blake Pump is extensively used on Railroads and Steamboats; is Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every Pump will be warranted to perform the work required of it by the purchaser, or it may be returned, and the money will be cheerfully refunded. The Blake Pump was awarded a Silver Medal at the Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on Exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, Market, head of Front Street, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.

The Pioneer Merchant.

In all the vast fields of mercantile enterprise, if there is any one pursuit that takes prominence over others, for its varied pheeee of usefulness, connected at the same time with all the viciesitudes of success and disappointment incident to an intimate connection and direct dealing with all the veried conditions and characters of the great world ontside the cities, thet person or pursuit is found in the Pioneer Merchent.

We eay pioneer; because let there be bnt a breath whispered, that here or there, a mining camp is inevitble, or at this or that point along the line of survey of some projected railway, or interior wagon road, and you find among the first to set hie stakes or pitch his tent at some proposed village site, will be the country merchant.

He leeds off, in every enterprise calculeted to aid the growth and prosperity of the new village. He is looked to, on account of his supposed conuection with merchents aud solid men of the cities, for the influence necessary to secure immediate postal connections with the great centers of trade aud business; and is supposed to be able to do anything, know everything, and everybody.

If school hcuses or churches are wanted, or a 4th of July celebration projected, he is expected to give to every eubscription a liberel starter; and to alleviate the wants of the poor or unfortunate, he is the one first celled upon, and always responds. He tekes stock in every projected turnpike or toll bridge likely to bring trade or travel to his embryo villege; gives liberal support to the first newspaper started, by paying more for advertising his business than any other trade, occupetion or profession.

He ie expected to heve the very best assortment of goods aud of the best quality, and sell them at the very lowest rates, and while doing so, is expected to take his pey in eggs at the very highest price, and even then is told by his cuetomers that they can buy the same kiud of goods cheaper in Sen Francisco.

And finally if a seeson of drouth occurs, with its usual attendante of short crope, "hard times" or a scarcity of money, he is expected to trust his goods in any amount, to everybody and without security, and weit for his pay any indefinite length of time that the nature of the case, or condition of the seesons, or ability or willingness of creditors to pay, mey seem to require.

And thne we find the pioneer merchaut of our mining camps, agriculturel and embryo villages, among the most useful, stirring, enterprising aud intelligent of the world's tradespeople.

New Incorporations.

The following have filed certificates with the County Clerk, Sau Francisco.

Admiral Nelson T. & M. Co.—Juue 22. Location: Little Cottouwood District, Utah Territory. Capital stock, $6,000,000, in shares of $100 eech. Trustеee—Samuel Purdy, R. H. Sinton, George F. Sharp, D. P. Belknap, aud Samuel Storer.

Atlantic and Pacific Cons. G. M. Co.—June 19. Location: El Dorado County. Capital, $5,000,000—in 25,000 sharee. Trustees—James S. Houseman, John Crocker, Jemes Curtis, Isidor Burns, S. Selomons, William Holden, Samuel Beatty, Daniel McLeod and H. Kosminsky.

Meetings and Elections.

The Star Consolidated Mining Compeny have elected the following Trustees for the ensuing yeer: O. F. Giffin, G. T. Lawton, L. S. Adams, J. H. H. Williams and Robert Sherwood.

The Mission Bay Bridge Compauy elected as Trustees on the 25th iust., Leland Stanford, C. P. Huntington, Mark Hopkins, Robert Robinson, and J. L. Wilcutt.

The Washingtou and Creole Mining Compauy have elected the followiug Trustees: C. F. Mc Dermott, Martin Tarpey, M. Skelly, A. J. Bowie Jr. aud Geo. D. Roberts.

The Imperial Mining Company elected the following Trustees on the 25th inst.: A. K. P. Harmon, J. D. Fry, H. C. Kibbe, J. H. Dobinson, Wm. Norris, Alpheus Bull and Thomas Bell. W. E. Dcan was elected Secretary.

The Mahogeuy Mining Company met on the 26th inst. and elected the followiug Trustees: Tyler Curtis (President), R. McKee, O. H. Bogart, John McFadden Thos, J. Owens. Secretary and Treasurer.

Silver Dollars to the number of 310, came up by the last Panama steamer, from the wreck of the Spanish Galleon Leocadia, which was sunk on the coast of Ecuador, 70 years ago. They were fished up by the Pacific Coast Wrecking Co., and are oxidized so as to look very little like silver.

A Day Among the Mills.

Milling Operations in Six and Seven-Mile Canons.

Tbe following is a eummary of tbe working condition of tbe various mills in the Six and Seven-Mile cañons, commencing witb tbe

Parke & Bowie.

To Ira S. Parke helongs the credit of perfecting a process, wbereby tbe tailings and slime can he made to give up their minute deposits of silver and gold. Various other parties bave essayed the same thing, but witbont meeting witb financial success. During the past four years the saving of gold and silver, from the waste of other mills, has grown to be an important branch of industry. Parke & Bowie are now running two mills on tailings and slime, hoth of wbicb are taxed to their utmost capacity. At present they are working seventy tons per day. The feeders for these mille are the old Savage works at Empire, the Nevada mill, Winfield mill, Bassett mill, and the Land mill, in Seven-mile Cañon. Two fourteen-mule teams are engaged in bauling tbe tailings from the Desert, whicb were lost in early times. Tbe lower mill is engaged on tailings gathered in a reservoir at Sugar Loaf in '63, '64 and '65. The above-mentioned firm are working seventy-five men, five teams (two of tbem the finest in the State), and six cart horses. Tbe mill is constructed so strongly, that a ten-horse team witb 30,000 pounds can be driven in upon the upper floor directly over the pans. Five pans are nsed in tbis mill, and six cbarges are put througb in twenty-four hours. We saw some of the "flonr" from this mill. It heats "Genessee" altogetber. We were strongly tempted to bring away a bandful in our pockets. The amalgamating processes in hotb mills are under the personal supervision of Mr. Sbay. In tbe upper mill one of the finest engines in tbe country is in operation. It is 65-horse power, witb 14-inch cylinder, 32-inch stroke, and has a piston-balance valve. The driving wbeel makes 75 revolutions per minute. Only two-tbirds of the capacity of tbe engine is taxed in running a full mill. The firm are about to put in a new ohlong pan called a "double muller." Tbe pan is 11 feet long, 5¼ feet wide, and 5 feet deep. It will hold about 5 tons. The muller will make 85 revolutions per minute. Two settlers will he used with this pan. There will be two discharge tubes leading from the pan into each settler. Tbe advantage this pan has over others, consists in the violent agitation produced witbin by the two mullers working togetber and throwing tbe pulp against each otber. Amalgamation is greatly facilitated by this procese. Thie pan is the invention of Mr. Parks. A patent has been applied for. The pan will work equally well in tailings or quartz pulp. A new style of boiler has been ordered for nse in this mill, called the Root Safety Boiler. It has no shell—is merely a number of tuhes, 10 feet in lengtb, set up on an incline of 30 degrees. A tube can be replaced at any time, and tbe capacity can he increased by putting in additional tuhes.

Nevada Mill.

The Nevada Mill bas 21 stamps and 12 Greeley pans. It is running on Chollar ore, and crushing 50 tons per day. Tbis mill has uuusual facilities for saving slime.

Winfield Mill.

This mill has 18 stamps. It is crnshing 40 tons of Chollar ore daily.

Land Mill.

The Land mill has 20 stamps. It is working on Cbollar ore, and crushes 45 tons per day. At this mill we saw a New Haven rock-breaker. Never before did we witness such a striking illustration of the power of mind over matter. Great bowlders of quartz would disappear in its rapacious maw with marvelous celerity.

Evans Nfll.

This is an energetic little mill, having but 6 stamps. It crushes 15 tons of Savage ore per day. Tbe battery bas a self-feeder and a double discharge. The drop of tbe battery is at the rate of 106 per minute. Tbis mill bas two Horn pans, with a settler to eacb pan. In connection with tbe other macbinery tbere is a Knox pan, which is used solely for testing rock sent to the mill hy prospectors.

Mariposa Mill.

This mill has 12 stamps, and works 40 tons of Hale & Norcross ore per day. It was leased from the bank of California by Messrs. Fair and Mackey tbree years ago. After it had been run for seven montbs the mill was thoroughly overhauled, and new tanks, pans and settlers substituted. The battery makes 95 drops per minute. The mill bas 5 Horn pans, 3 settlers and 1 clean-up pan. Its working capacity has been increased from 24 tons to 40 tons with tbe same number of stamps. It is, in all prohability, tbe steadiest running mill in the State. Tbe average loss of time is only an bour per month. Great economy has been practiced by the foreman in saving slime and tailing. We were shown a plan of a 10-stamp mill, as designed by Mr. Bisbee, which, as regards economy and convenience, we do not helieve can be surpassed.

Sierra Nevada Mill.

This 20-stamp mill crusbes from 55 to 60 tons of ore per day. It bas 2 pans and 1 settler. The rock from the Sierra Nevada mine is worked principally for the gold, which is caugbt in the battery and on copper plates. The water used in this mill is pumped out of tbe mine. The ore is brought directly from the mine to the mill hy a cbute.—*Virginia Enterprise.*

New Lighthouse.—Tbe Oregon Iron Works situated in Portland, have just finisbed tbe iron work for tbe new ligbthouse being erected at Cape Foulweather, situated 170 miles soutb of tbe moutb of the Columbia river. Tbere are five flights of stairs, corkscrew style, floors, framework for the lantern to sit on, with railing and a hundered other fixtures, all of as elegant wrought iron work as could be turned out of any similar establishment, which reflects great credit on a young manufacturing place like Portland. The lighthouse is to be a first-class one; it will be built principally of brick. The mason work will be eigbty feet bigb, the lantern portion about twenty feet, making tbe entire huilding fully one hundred feet in bight. The light is to be a stationary one, but it will he so arranged that it can be easily changed to a revolving one if it is afterwards found desirable to do so. The entire work is under the snpervision of Mejor H. M. Robert, Government engineer for the river and harhor improvements of the Pacific coast. It will be a beautiful structnre, a valuable acquisition for the safety of the sbipping of this coast, and will be lighted about the 1st of January next. The entire cost will be from $90,000 to $100,000.—*Cor. Bulletin.*

Sutro Tunnel.—The *Territorial Enterprise* of tbe 9tb says:—The Sutro Tunuel is now in a distance of 2,911 feet. During the past week the tunnel was pushed forward ten feet. Day before yesterday the work of opening the tunnel to its full hight and width was commenced. Good progress is being made on the new air sbaft, whicb is fifty-four feet in depth, tbirty feet of whicb was made this week. A cross-cut, eigbteen feet in length, has been made from tbe tunnel, and from the end of this they are preparing to make a "raise" to meet the work that is being done above. Shaft No. 1 is now down 203 feet and is in good gronnd, hut very wet; No. 2 is down 498 feet, in good ground, but tbe water is fast increasing; No. 3 is down 263 feet in bard ground; No. 4 is down 254 feet, in good ground, but the water is coming in. The company now employ 280 men, and are pushing the work as rapidly as possible at every point. The progress of the tunnel will hereafter be watched witb considerable interest as it is fast approaching a point wbere it is likely to cut some of the leads crossing through from the Flowery to the Devil's Gate range.

To Wine Shippers.—In enswer to a letter from the Wine Growers' Associetion of Napa and Sonoma, the C. P. R. R. Company makes the following proposition:

"If the Sonoma people will agree to forward their wines via the 'Overlend Route,' we are prepered to give the following retes, eud issue through bills of lading accordingly—nemely: On wine, in wood, in carloads, from Santa Rosa (or Nepa), to Chicego, St. Louis and New York, $2.21 per 100 ponnds. In quautities less than carloads, $3 per 100 pounds. To Indianapolis, Cincinnati, Boston, Philadelphia and Baltimore, in car loads, $2.46 per 100 pounds; in less quantities, $3.46 per 100 pounds.

Temple of Diana at Ephesus.—After being buried for years, this femous temple wae discovered about twelve months ago by Mr. Wood who has been searching for it since 1863. A large area has been cleared to the pevement; the deposit above was 22 feet deep, and various architectural marbles have been recovered. The scale of the architecture is colossal, exceeding in proportions all other Grecian temples. The style of eculpture is bold and effective ae decoratiou, but inferior to that of the purer periods of Grecian art. Mr. Wood is shipping the best of the specimens to the British museum.

Blast at Dutch Flat.—A dispatch, dated June 26th, etates that a blaet of 3,500 pounds No. 2 Giant Powder, in Harriman & Taylor's gravel bank, at Gold Run, on that day, threw down and broke 200,000 cubic yards of gravel. The blest was a decided success.

San Francisco Metal Market.

PRICES FOR INVOICES

50 CENTS A COPY

Will be paid at this office for a few copies of the Scientific Press of January 7, 1871. Subscribers having broken files on hand will please examine and see if they cannot accommodate.

Philadelphia Agency.—W. H. Daffin, formerly of San Francisco, is our correspondent and business agent, Frankford, Philadelphia, Pa.

H. Bahlen & Bro., formerly of Havilah, Kern county, will please communicate with this office.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by Dewey & Co., Patent Agents and Publishers Scientific Press, S. F.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Extire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all grocers, to whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. jun29-5w

RICHARD H. BUEL, Consulting Mechanical Engineer, 7 Warren Street, New York. Advice and assistance given to those who desire to invest funds in meritorious and valuable Patent Rights. Machinery of all kinds bought and sold. Unusual facilities for testing engines, boilers and other machinery. I refer particularly to Professor R. H. Thurston, of the Stevens Institute of Technology, who has consented to associate himself with me in consultation on matters of special importance. jun15-3t

DEWEY & CO.,

American and Foreign

Patent Agents.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free.

Engraving on Wood, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

The Pacific Rural Press.

The Pacific Rural Press is now in its third volume. Its columns contain a large amount of original information upon the different branches of husbandry on this coast. Its great variety of contents is properly systemized for the convenience of the reader, and ably prepared in pleasing language and style. Each number contains something of rare interest to every member of the household.

The state of this new field of agriculture, so different from all others; the new and improved methods of farming necessary here; and the absence of any published record of farming and rural experience on this coast, form a combination of circumstances which render a really good journal of greater importance to farmers here than are similar issues to farmers in any other part of the world.

The Pacific Rural Press has been heartily received and well patronized, and its liberal success enables us to improve and enrich its columns from month to month.

Its reading and advertising matter is entirely chaste. All farmers should subscribe without delay. Every household should enjoy its richly filled pages.

Subscription, in advance, $4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts. Address

DEWEY & CO.,

Publishers, No. 338 Montgomery street, S. F.

ONE DOLLAR A YEAR

— FOR THE —

PACIFIC COAST

Mercantile Director.

This is a new 16-page monthly newspaper, of special information for wholesale and retail tradesmen. It will also contain reading of interest and importance to all business and professional men on the coast.

OUR TABLE OF CONTENTS

Will comprise Full Prices Current and Monthly Review of the Wholesale Markets; Diagrams of the Fluctuations of the Produce Markets; Rates of Freight and Passenger Fares—corrected monthly; Illustrations and Sketches of Prominent Mee and Buildings; Editorials on Manufacturing and Industrial Progress; Departments containing appropriate reading matter and reviews for various branches of trade, including "Grocery and Provisioo," "Dry Goods;" "Trades and Manufactures," etc., etc.

Our first issue for May consists of 24 pages, embracing FORTY-FIVE COLUMNS of important reading matter—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly subscription, in advance, $1. Subscribers to the Scientific Press or the Pacific Rural Press will be supplied at half price.

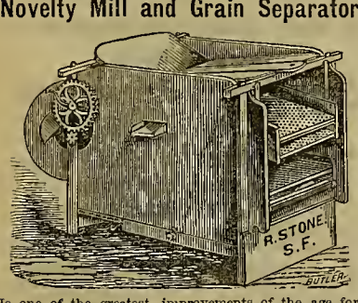
Published by MURRAY, DEWEY & CO., At the Publishing Office of the Scientific Press and Pacific Rural Press, San Francisco.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines, and Agricultural Lands in Mining Districts, of the U. S., printed in circular sheet, for sale at this office. Single copies 10 cts. Usual discount to the trade.

THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far excels anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

25v3 422 Battery street, San Francisco.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Corona Consolidated Mining Company—

Location of works, Eureka District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 409 California street, up stairs, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 22d day of August, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.

Office, 409 California street, San Francisco, California. Jun29-3t

Eagle Quicksilver Mining Company---Lo-

cation of works, Santa Barbara County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 8th day of May, 1872, an assessment of $40 per share was levied upon the stock of said company, payable immediately in gold coin of the United States, to the Secretary at his office, room 5, No. 302 Montgomery street, San Francisco, California.

Any shares upon which said assessment shall remain unpaid, on Thursday, July 11th, 1872, shall be deemed delinquent, and will be duly advertised on Saturday, July 13th, 1872, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 15th day of July, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. WM. H. WATSON, Secretary.

Office—Room 5, No. 302 Montgomery street, San Francisco California. ma11.

Excelsior Mill and Mining Company—Lo-

cation of works, Cope Mining District, Elko county, State of Nevada.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 20th day of June, A. D., 1872, an assessment of Two Dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No, 415 Moutgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 27th day of July, A. D., 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Mouday, the 19th day of August, A. D., 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. FRANK SWIFT, Secretary.

Office, No. 415 Montgomery street, San Francisco, Cal. Jun22-3t

Hudson Gold Mining Company—Location

of works, Cherokee Mining District, Plumas county, State of California.

Notice is hereby given, that a meeting of the Trustees of said Company, held on the 18th day of June, A. D., 1872, an assessment of Ten Cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 411 California street. Any stock upon which said assessment shall remain unpaid on Saturday, the 27th day of July, A. D., 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 17th day of August, A. D., 1872, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

J. L. KING, Secretary.

Office, 411 California street. Jun22-3t

Lyons & Wheeler Mining Company—Lo-

cation of works, Maynard Mining District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of Assessment, No. 2, levied on the 18th day of May, 1872, the several amounts set opposite the names of the respective Shareholders as follows:

Fourth of July Celebration !

☞ Headquarters of the Grand Marshal, No. 417 Kearny street.

A CORDIAL INVITATION

Is extended to all Military and Civic Organizations in this City and County to participate in the Celebration of the approaching Anniversary of American Independence. The heads of all organizations are earnestly requested to signify their acceptance of this invitation, and make immediate application at these headquarters, that they may be assigned positions in the line.

By order.

R. BEVERLY COLE,
26v3td-hp Grand Marshal.

To Engineers and Millmen.

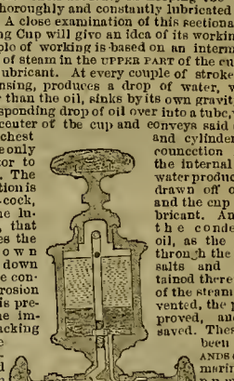
NATHAN & DREYFUS'

PATENT

Self-Acting Lubricators for Cylinders.

Their advantages over other lubricators are so striking, that it is only a question of time for them to come into general use—their accuracy in keeping the valves and pistons thoroughly and constantly lubricated being unequalled. A close examination of this sectional view of Lubricating Cup will give an idea of its working.

The principle of working is based on an intermittent condensation of steam in the upper part of the cup containing the lubricant. At every couple of strokes, the steam condensing, produces a drop of water, which, being heavier than the oil, sinks by its own gravity, and raises a corresponding drop of oil over into a tube, which arises in the center of the cup and conveys said oil directly to the chest and cylinder, this tube being the only connection from the internal part of the Lubricator to the water produced by of the engine. The drawn off once a the condensation is and the cup filled day by a side-cock, bricant. Another again with the lu- the condensing advantage is, that oil, as the water process refines the through the lubri- settling down cants and acids cant carries down tained therein. In which may be con- of the steam chest this way corrosion vented, the power and cylinder is pre- proved, and an of the engine im- saved. These Lu- mense amount of packing bricators have been adopted by over EIGHTY RAILROADS in the United States.



☞ Send for a Circular and Sample, for which no charge unless approved of.

Address TREADWELL & CO.,
San Francisco.

DREYFUS' PATENT SELF-OILERS,

For Shafting, Engines, Machines, Etc.

Save from 75 to 95 per cent. of oil used on shafting or machinery bearings, No better investment for the amount can be made by any person having machinery or running shafting. They are widely known for their reliability and economy. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed A single trial will prove their value. We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all description of boxes. Send for Price List and Circular.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER,

MANUFACTURED AT THE

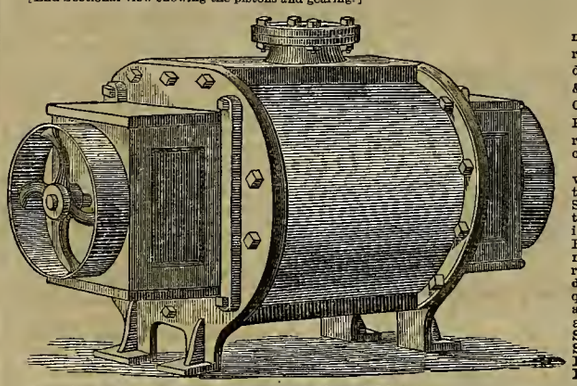
GLOBE IRON WORKS,

Stockton, Cal.

[End Sectional view showing the pistons and gearing.]

Awarded the First Premium at the Paris Exposition.—Patented November 1, 1864; July 24, 1866; and October 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 Per Cent. less power than any Blower now in use.



One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION. — Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article. Quartz, Saw and Grist Mill, Iron, Stationary and Steamboat Engines, Horse-Power and Pumps, of all Sizes.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

The Hesse Grinder and Amalgamator.

BEST IN USE!

Old Files re-cut and warranted equal to new.

REAPER AND MOWER SECTIONS, BARS AND KNIVES COMPLETE,

at a saving of 50 per cent. Orders from the country promptly attended to. 9v19-1y

---

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills, as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.

Office, 315 California street. A. J. SEVERANCE, CHAS. H. RANDALL, J. GUS. BURT.

22-v23-tf

Metallurgy and Ores.

RODGERS, MEYER & CO.,

COMMISSION MERCHANTS,

ADVANCES MADE

On all kinds of Ores, and particular attention PAID TO

CONSIGNMENTS OF GOODS.

4v16-3m

LOUIS FALKENAU,

STATE ASSAYER,

Analytical and Consulting Chemist,

421 Montgomery St. up stairs.

Particular attention given to the Analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soils, Commercial Articles, Etc.

One or two pupils can receive theoretical and practical instruction in Assaying, Analysis, or any particular branch of Chemistry at the laboratory. 11v21-3m

---

LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical CHEMIST,

No. 611 Commercial Street,

(Opposite the U. S. Branch Mint,

SAN FRANCISCO, CAL. 7v21-3m

J. W. THURMAN,

(Successor to S. W. Howland & Co.,)

ORE CRUSHERS AND SAMPLERS,

Nos. 413 and 415 Mission Street, SAN FRANCISCO.

Particular attention paid to Ores received on consignment

ALL ORDERS EXECUTED AT THE SHORTEST NOTICE. 5v24-6m

CALIFORNIA ASSAY OFFICE

No. 512 CALIFORNIA STREET,

One Door West of Montgomery.....SAN FRANCISCO.

J. A. MARS, Assayer.

☞ Analysis of Ores, Mineral Waters, etc. 10v20

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,000 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required. 17v24-1y

---

O. W. STRONG. W. L. STRONG

C. W. STRONG & CO.,

Metallurgical Works,

No. 10 Stevenson Street, near First, SAN FRANCISCO.

We purchase Ores, Bullion, etc. Ores worked and Tests made with care. Also, Assays of Gold, Silver, Copper, Lead, Tin and other Metals. 23v22tf

---

PLATINUM

Vessels, Apparatus, Sheet, Wire, Etc., Etc.,

For all Laboratory and Manufacturing Purposes

H. M. RAYNOR,

25 Bond street, New York.

Platinum Scrap and Ore purchased. 22v18

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

List of Patents.

Air Exhausting Apparatus for Preserve cans, D. N. Phelps.....156, 233
Alcoholic Spirits, Manufacture, I. J. Rolfe & J. Rogers..... 233
Amalgamator, E. J. Frazer..... 297
Amalgamator, G. C. Lantry..... 233
Animal Trap, J. Rowman 233
Animal Trap, J. W. Fishback..... 233
Apparatus for Aging Wines, A. Luquet & P. Huerno..... 348
Apparatus for Obtaining Mercury from Ore, H. Johnston..... 249
Apparetus for Lighting gas by Electricity, J. Vansant.....233, 380
Apparatus and Process for Making Sulphate of Lead, H. A. Whiting.. 249
Artificial Stone, G. L. Hagan..... 249
Artificial Teeth, C. H. Mack..... 233
Attachment for Whippletrees, J. T. Williams.... 405
Bagatelle Game, Wm. Evers..... 67
Baling Press, F. Huntington & J. F. Carter..... 325
*Bedstead, O. C. Petersen.....273, 348
Bedstead Fastening, Seneca Jones..... 409
Blocks for Wood Pavement, H. M. Stow..... 249
*Bolt Fastening Attachment for Locks, C. F. Townsend & A. F. Potter..... 113, 312
Brick Kiln, F. F. Boudreyo.....247, 233
*Buckle, Improved Tug, N. D. Fowler.....152, 233
Building Block, John L. Booue..... 392
*Bung and Bung Inserter, D. B. Rickey.....233
Car, Steam Propulsion, T. K. McDonnell.....249, 305
Candlestick, Jos. Williams..... 348
Car Coupling, H. H. Morgan & Geary..... 57
Car Truck, S. N. Norton. 312
Carriage Wheel, Chas. Palmer..... 233
Clasp for Mantles, A. Will & J. Finck..312, 380
Clothes Drier, A. C. Stow.....249, 380
Compound Implement, J. Cowbarbaun..... 249
Curing Tobacco, J. D. Culp..... 233
Dish Washing Machine, Cathar ine Woodmansee 348
*Extension Shelf and Bracket, A. Rosenfield. 233
Fare Box, Carlton Newhall..... 348
Fence Post and Telegraph Post, John L. Boone.... 392
Fence, R. A. Riggs..... 325
Flue Stopper..... 195
Flag-hoisting Apparatus, J. W. McKeuzie..... 325
Furnace for Smelt'g Ore, T. L. & Schenck..... 249
Gang Plow, S. Ballou and A. M. Abbott..... 233
Gang Plow, G. W. Haines 233
Gang Plow, D. A. Manuel 392
Gang for Cooking, G. W. Coffee..... 348
Governor, C. F. Bowen.. 392
Grain Cleanor, J. H. De Force..... 409
Grain Weighing Machine, G Copeland..... 325
Grape Crusher & Stemmer, G. & W. F. Johnston..... 233, 380
Grain Pulley, A. S. Hulldie..... 409
Harrow, O. J. Leabo.... 233
Horse Power, T. Churchman..... 233
*Horse Power, S. Pelton..... 177, 233
Hose Cart, W. E. Shaw and O. A. Ashley..... 380
Hose and Tubing, S. P. Cook..... 249
*Hydraulic Elevator, T. Siebbins..... 113
Ice Moulding and Separating Machine, S. B. Martin and J. M. Heath 380
Knee Brace for Sewing Machines, P. Mills.. 297
Lamp, E. Boesch..... 29, 57
*Lamp, M. Samuels..... 57
Lamp Bracket, H. Canipbell..... 233
*Lamp Chimney Protector, C. M. Gruby and T. I. Lichtig..... 233
Lubricator, W. T. Garratt 348
Machine for Clarifying and Mixing Lard, O. J. Backus..... 249, 348
Machine for Making Concrete Pipes, G. J. Egan 249
Magnetic Indicator, J. Unna..... 348, 392
Meterial for Making Paper, Filling Mattresses, Etc., H. Kirkland..... 233
Medical Compound, J. M. Cantrell..... 233
Method of Operating Rock Drills, A. Blatchley..... 392
